After a vote of thanks had been passed to Mr. Connold, Mr. Whitley, speaking of the church, said there was little of interest in the building with the exception of the tower, which was a fine example, and on it he pointed out the famous Pelham buckle. The church had been rebuilt in 1794 and in 1857, and was a brilliant example of how not to do things. Turning to the old Manor House below, a visit to which was made by permission of Captain Papillon, Mr. Whitley said it was one of the most interesting examples of Domestic architecture in Sussex. There was, he said, probably a doorway in the south wall, and also an entrance to the room above by external stairs. The mouldings were good, and there was a small room over the porch, and a large upper room used for a chapel or oratory. There were two pointed lights, and the hall was divided by wooden partitions or curtains, and there had been wooden buildings around, but these had disappeared. From all he had seen, he came to the conclusion that the place was used by the lord of the manor as a shooting-box. The date was 1250.

The drive was resumed to Hollington Church in the Wood, *viâ* Battle Road, and here Mr. Dawson, called upon unexpectedly, made a few remarks, mentioning that the church appeared in Domesday Book, and that the register dated back from 1636. He made known the interesting fact that Mr. Hamilton Hills, who had devoted time to discover to whom the church was dedicated, had good grounds for the belief that it was to St. Oswald, the popular belief in Hastings and among many archaeologists being that it was dedicated to St. Leonard. There was little of interest in the church for them beyond the sealed-up door, two windows and the remains of an octagonal font, but the place was a favourite spot for tourists. Mr. Dawson recounted the legend that the devil endeavoured to stop the building of the church, but was beaten, and so he caused a great wood to grow to hide it. But, added the speaker, man came along and cut the wood down, unfortunately for the beauty of the situation. The homeward journey was then commenced.

### SWANSCOMBE CHURCH.

SAD havoc has been caused to Swanscombe parish church, one of the oldest, if not the oldest, of ecclesiastical buildings in Kent, says the *Daily Telegraph*, by the extraordinary thunderbolt which struck and set alight the woodwork of the spire. Despite heroic efforts to combat the flames, the tower and nave were laid in ruins. Only the chancel remains, with the blackened walls of the nave, to which the charred roof-beams still cling. The shingled octagon spire which surmounted the square tower, with its six eighteenth-century bells, has disappeared, and the precious Norman font of solid chalk stone, said to have been damaged by Cromwell's soldiers, is shattered. With difficulty the church registers, dating back to 1549, were rescued in a sadly battered condition. Only thirty years ago the building was restored by Sir Erasmus Wilson, and although the much more formidable task now presented will doubtless be vigorously undertaken, the parishioners, as well as the wider circle of ecclesiologists, cannot but regard with grief the destruction of a fabric which has been treasured for centuries. Curiously enough, the church was struck by lightning just a hundred years ago—on Whit Tuesday, 1802.

Swanscombe is said to be the only Anglo-Saxon church in Kent. The actual consecration as a place of worship of this picturesque height, commanding a wide view of the Thames estuary, is indeed lost in the mists of time. There is said to have been a church of some sort there as early as the sixth century. Dr. Thorpe identified the place as the *Vaginacæ* of the Romans. Certain traces of these invaders are to be found in the neighbourhood. Some years ago a copper coin of Nero was dug from under a hedgerow in the parish, and another, of Severus, was turned up by the plough. The name Swanscombe is believed to be derived from that of Sweyn, who, sailing up the Thames, is said to have landed where Greenhithe now stands. But this and much more of the "history" of Swanscombe must remain mere tradition. It is not apparently known when the present church, which is dedicated to St. Peter and St. Paul, was founded, but the round-headed window in the south side of the tower, supposed to be of Saxon workmanship, is ascribed to the time of Edward the Confessor.

A familiar tradition claims Swanscombe as a shrine of St. Hildeferth, to which came many pilgrims to invoke the aid of the saint in the cure of madness. Lambard, in his "Perambulation of Kent," 1570, has the following:—"The church at Swanscombe was much haunted in times past, for Saint Hildeferth's helpe (a bishop, by conjecture of his picture yet standing in the upper window of the South Ile, although his name is not read in all the Catalogue of the Saxons), to whom such as were distracted came for restitution of their wits, as thicke as men were wont to saile to Anticyra for Heleborus. This cure was performed here by warmth, close-keeping, and good diet, means not only not strange or miraculous, but meer naturall, ordinary and reasonable. And therefore, as on the one side, they might truly be thought mad men and altered in their wits that frequented his pilgrimage for any opinion of extraordinary working, so on the other side Saint Hildeferth (of all the saints that I know) might best be spared, seeing we have the keeper of Bethleem, who ceaseth not, even till this day, to work mightily in the same kinde of miracle." More than one authority testifies to the crowds of pilgrims, and in "Jottings of Kent" mention is made of a stained-glass window in the south side, containing a picture of the saint, decked in the vestments of a bishop.

According to another tradition, it was in the vicinity of Swanscombe that the resolute men of Kent, carrying green boughs after the manner of the Scots at Dunsinane, wrested from William of Normandy the recognition of their ancient rights and privileges. For centuries the living has apparently been an appendage of the manor of Swanscombe, but mention is made of a dispute in the reign of Henry III. between the Prior of St. Mary's, Southwark, and Warine de Montchensie, concerning the advowson and right of presentation.

Within the church are the tombs of various members of the Weldon family, including Sir Ralph Weldon, "Chiefe Clarke of the Kitchin to Q. Elizabeth, and afterward Clarke Comptroler to King James, and dyed Cla: of the Grenclouth on the 12th of November, in the yeare 1609." Sir Ralph's grandfather "served King Henry 7, and was Mr. of the Household to King Henry 8," and his son Anthony is the author of "Memoirs of the Court of James I."

The rector, the Rev. George Hale, in appealing for funds says:—"The church is one of very considerable archaeological value. A church existed at Swanscombe as early as the sixth century, and the present structure is said to be the only Anglo-Saxon church in Kent. The tower is probably Transition Norman, and there are a number of flat Roman tiles built into it, standing as it does close by the old Watling Street. In the lower part of the tower is a double-splayed window, ascribed to the time of Edward the Confessor. The chief portion of the fabric is Early English with later insertions. The church was once frequented by pilgrims, who came to invoke the aid of St. Hildeferth for the cure of insanity—a Bishop of Meaux, born in 607, who died in 660, and in whose honour the collegiate church of Gournay is dedicated. The saint was represented in a stained-glass window, of which a small portion still remains in the south aisle. This window has, fortunately, escaped the fire. The wall of the south aisle also shows the steps leading to a rood-loft, and there are also in the church three ancient piscinæ and an aumbry, or, as some say, a leper's window closed on the outside. Part of a fine carved-oak rood-screen, which had been placed across the arch of the tower, has been, unfortunately, destroyed by the fire; also the rare Norman font formed out of a block of solid chalk and carved with the emblems of the four Evangelists has been shattered. But this, it is hoped, may be fitted together again, as the fragments have been carefully preserved, and the most valuable piece of carving is still intact. The work of restoration has been entrusted to the architect who restored the church in 1874, Mr. Jabez Bignell, a pupil of Sir Gilbert Scott, who spoke of the restoration as "a most careful and successful piece of work." According to his report, sent in to-day, the chief work to be done is a new nave roof, most of the north and south aisle roofs, new wood spire and floor to the tower, also the reseating of the nave and aisles, with repairs to the stonework and fabric generally, and possibly the rebuilding of the upper portion of the tower in addition to a set of new bells. The latter is perhaps the saddest loss of all to the neighbourhood. The six bells of Swanscombe were famous throughout Kent, three of which were cast in 1751. The cost of restoring the building to its original appearance, including new bells, he estimates at about 4,000*l.* The church was insured in the Ecclesiastical Insurance office for 2,550*l.*, including chancel and organ, which have suffered to a comparatively slight extent. I should mention that the lightning conductor had been examined, as it happened, a few days before in the course of some repairs by the churchwardens, and appeared to be free from any defect. But the lightning appears to have struck the wooden-shingled spire, and the whole structure was observed to be blazing furiously a few moments afterwards. Every effort was made by the local fire brigade, who were on the spot almost immediately. But the men were handicapped by the

low pressure of the water obtained from the Kent Waterworks hydrant, which made it impossible to send a jet as high as to reach the top of the tower. The church plate, including a chalice of 1620, is safe. The registers, dating back to 1559, have been taken from the safe, which was exposed to the fire for some hours before it could be rescued, and placed in the hands of experts, much damaged, but not destroyed.

## TESSERÆ.

### Influences on Art.

IN every age art has been the embodiment of either the democratic, religious or aristocratic idea; that is to say, the people, priestcraft and rulers, have alternately given it direction. The style and thought of the various schools which have arisen among the several nations that have developed art will be found to be characterised in a great degree by the prevailing sentiment of their era, varying in choice and treatment of subjects according to the fluctuations of morals and education. At no time has art been entirely free. Perhaps it is too much to expect that it will ever wholly liberate itself from human prejudice or infirmity and rise to its legitimate position of an incorruptible teacher of truth and expounder of beauty. The utmost that can be rationally hoped for it is that good taste may be so diffused as to create a demand for excellence and a prompt rejection of artifice. Great minds only can so impress the common mind as to lead it steadily forward in the road of good taste. Their task is a gigantic one, owing to the eccentricity of popular impulses and the diligence of weaker minds, who, not content with being wrong themselves, are ever striving to draw others after them. Yet with all these drawbacks, we constantly see in art signs of promise. Her struggles are incessant to escape from the snares in her path, and her progress, as a whole, may be said to be onward. Every lofty development of genius in schools becomes a stimulus to greater exertion. It is true many ages may yet pass before certain past excellence is again rivalled, but the standard it creates fixes itself indelibly upon the human mind, which contents itself permanently with nothing inferior. Whatever degree of perfection in their particular studies Classicalism arrived at we seek for; so of Mediævalism. Thus modernism has the threefold advantage of possessing not only her own artistic energies and aspirations, but also the experience and progress of those two great eras of art. Schools of art had their origin in individual talent, fostered by public patronage to a degree which exalted the private taste or particular excellence of the artist into a rule, as it were, for his immediate neighbourhood or generation. They have all been more or less partial in their scope owing to the particular direction given to the genius of their founders which continued to affect their pupils until an equal or superior mind arising, forced the bias of his own method upon his generation, and thus modified the old or created a new school.

### The Porch in Architecture.

The only known instance of a porch in Greek architecture is that in the octagonal structure called the Tower of the Winds, or that of Andronicus Cyrrhestes, which has a small prostyle portal on two of its faces, north-east and north-west, each consisting of a simple distyle, or two columns and their entablature, surmounted by a pediment, and which therefore may be regarded as the prototype of those ornamental compositions for doors and windows so greatly affected in Italian architecture, which present a microstyle application of the orders, that is, small columns adapted not to the entire structure, but to subordinate parts of it. When portico fronts were laid aside, as partaking too much of the previous Pagan temple; when columns began to be not only attached to the building, but employed as microstyle decorations to its different external stages or storeys, often very irregularly and generally connected together by arches—in short, when the Roman style was transformed into and superseded by the Byzantine and the Lombardic styles, porches began to be important features, subordinate indeed in size to the structures to which they were attached, but principal in regard to embellishment, being frequently composed of groups of small columns elaborately wrought, and some of them often placed on the backs of lions or other animals, and supporting a series of concentric arches or arch-volt mouldings equally enriched. Here microstyle embellishment may be said to have been carried to such a height as to be ultimately lost sight of; the columns became at length mere subsidiary members and a combination of vertical mouldings or shafts cut out of the receding angles constituted the general splay of the whole portal, which was thus extended in appearance ad libitum, without regard to the size of the actual doorway or aperture itself, a very important advantage as regards design. In the Norman Gothic style the porches or portals are little more than a modification of the similar features in Byzantine and Lombardic architecture. Of porches, however,

strictly so called, that is, portals projecting out from the edifice so as to form a sheltered external vestibule, we have few Norman instances, and those do not occur in the principal front, but at the sides of buildings. The same also is the case in Gothic architecture, where, though we often meet with spacious and magnificent portals, especially in continental examples, we do not find advanced porches brought out beyond the general plan of the building in front; the porch being there almost invariably enclosed within the lower part of the structure, even where it may be said to project with respect to that part of the front which is seen above it, but on a different plane, as, for instance, in the front of Westminster Hall, Winchester Cathedral, &c., although in those cases the entrances are placed rather within deep recesses than porches. In church architecture entrances of the last-mentioned kind hardly ever occur at the west end or front, but were frequently made very conspicuous features in the side elevations, of which we have striking instances in the beautiful north porches at Salisbury and Wells cathedrals, both of which advance out very considerably.

### Norman Architecture.

A grand simplicity in the form and figure of Norman buildings is one of the most striking and important distinctions of this species of architecture. Its long-drawn parallel lines are very rarely interrupted by prominent members in a transverse position, and the smaller features, such as buttresses and cornices, only sparingly break in upon the monotony of the surface. A turret with a pinnacle, rigid in shape, might sometimes be allowed to distinguish the extreme angles, but the parapet which crowned the wall was never divided in its extent by an embrasure or any kind of ornament. The plain figure on outline here described might contain many windows and many mouldings, and numerous sculptures might be required to complete the design, but simplicity and parallelism in the essential masses constituting the plan of the building were its necessary and approved features. The buttresses of a later period stood forward on a bold base and retreated to their summits in fleet lines and at regular intervals; those of Norman architecture were added to the substantial walls—were made to preserve a direct line from top to bottom, or to diminish their substance so slightly as to be considered no material departure from the severe and somewhat stiff character of the style. Yet this may be regarded as the prototype of the beautifully ornamental buttress of the thirteenth century; they who invented the design left to others the merit of bringing it to perfection. Norman architecture possessed height, extent and variety of embellishment, and an unbroken, or only an occasionally broken, superficies was its common and decided characteristic. Applying these remarks more particularly to Domestic architecture, it will be observed that while its specimens often exhibit very rich and handsome varieties of sculpture, the constituent features of the external design are few and rarely stand in advance of the main wall. Thus it appears that this style was always distinguished by broad and large masses, and it is doubtful whether the straight line of the roof was ever embellished with more weighty ornaments than the chimneys, which, with few exceptions, were cylindrical, tall and very graceful.

### Greek Painting.

There is a general prejudice against the opinion that the painting of the Greeks equalled their sculpture, and the earlier discoveries of the remains of ancient paintings at Pompeii and Herculaneum tended rather to increase this prejudice than to correct it. The style of the paintings discovered in these cities was condemned both by Pliny and Vitruvius, and yet almost every species of merit may be discovered in them. What, therefore, must have been the productions which the ancients themselves esteemed their immortal works, and which singly were estimated equal to the wealth of cities? These remains of Pompeii and Herculaneum induced Sir Joshua Reynolds to form a decided opinion upon ancient painting. He remarks:—"From the various ancient paintings which have come down to us we may form a judgment with tolerable accuracy of the excellences and the defects of the arts amongst the ancients. There can be no doubt but that the same correctness of design was required from the painter as from the sculptor; and if what has happened in the case of sculpture had likewise happened in regard to their paintings, and we had the good fortune to possess what the ancients themselves esteemed their masterpieces, I have no doubt but we should find their figures as correctly drawn as the Laocoon, and probably coloured like Titian." This opinion has been further confirmed by later discoveries at Pompeii, especially by the great mosaic of the Casa del Fauno discovered in 1831, supposed to represent the battle of Issus. But the beauty of ancient sculpture alone is itself a powerful advocate in favour of this opinion, for when art has once attained such a degree of excellence as the Greek sculpture evinces, it is evident that nothing mediocre or even inferior could be tolerated. The principles which guide the

practice of both arts are in design and proportion the same, and the style of design in painting cannot have been inferior to that of sculpture. Several of the most celebrated ancient artists were both sculptors and painters: Phidias and Euphranor were both; Zeuxis and Protogenes were both modellers; Polygnotus devoted some attention to statuary; and Lysippus consulted Eupompus upon style in sculpture. The design of Phidias and Euphranor in painting cannot have been inferior in style to that of their sculpture, nor can Eupompus have been an inferior critic in his own art than in that of Lysippus. We have besides the testimony of nearly all the Greek and Roman writers of every period, who in general speak more frequently and in higher terms of painting than of sculpture. The occasional errors in perspective detected in some of the architectural decorations in Pompeii have been assumed as evidence that the Greek painters generally were deficient in perspective. This conclusion by no means follows, and is entirely confuted by the mosaic of the battle of Issus, in which the perspective is admirable; in many other works also of minor importance the perspective has been carefully attended to. We know, moreover, that the Greeks were acquainted with perspective at a very early period, for Vitruvius says that when Æschylus was teaching tragedy at Athens Agatharcus made a scene, and left a treatise upon it. By the assistance of this Democritus and Anaxagoras wrote upon the same subject, showing how the extension of rays from a fixed point of sight should be made to correspond to lines according to natural reason, so that the images of buildings in painted scenes might have the appearance of reality, and although painted upon flat vertical surfaces some parts should seem to recede and others to come forward. This class of painting was termed scenography by the Greeks, and appears to have been sometimes practised by architects. Clithenes of Eretria is mentioned as architect and scenographer. Serapion, Eudorus and others were celebrated as scene-painters. Scene-painting was perhaps not generally practised until after the time of Æschylus, for Aristotle attributes its introduction to Sophocles.

#### Heriot-Watt College, Edinburgh.

SIR,—In your article on the "Heriot-Watt College, Edinburgh," reference is made to Callimachus as the poet of the hymn to Zeus, but I venture to suggest that it was Cleanthes, the third of the early Stoic teachers, who drew water by night for his gardens and studied philosophy in the day, and to whom we are indebted for the profound and majestic hymn to Zeus which in the opinion of Professor Mahaffy "would alone redeem the Hellenistic age, as it stands before us, from the charge of mere artificiality and pedantry."—Yours obediently,

J. T. RAWLINGS.

152 Milkwood Road, Herne Hill, S.E.:  
August 18, 1902.

#### GENERAL.

**The Memorial** to Her late Majesty Queen Victoria, to be placed in the church of St. Mildreds, Whippingham, by His Majesty King Edward, will consist of a reredos, clergy seats, communion table, marble floor to the chancel, &c.

**A New Church** is being erected at Haslemere, one of the most beautiful parts of the county of Surrey. The architects are Messrs. Spooner & Cobbold, of 17 Red Lion Square, Holborn.

**The Earl of Rosebery**, it is anticipated, will shortly open the new technical schools at Leamington.

**The Authorities** of the Sheffield University College have adopted a site at Western Bank for the new university buildings, the technical department remaining at St. George's Square. The estimated cost of the scheme is 53,000*l.*, of which 48,000*l.* has been promised.

**The Result** of the examination of the University Extension Lectures on the History of Architecture, held at the Chelsea Polytechnic last session, has just been announced as follows:—J. G. Wiles (certificate of distinction), G. Wilson (certificate of distinction), A. C. Goulder (certificate of distinction), H. Stewart, J. Henry, R. Crosthwaite, E. Heath, G. Gifford, A. Cooke, F. Hedges, H. Hèlin, E. Fowler, E. Topping. The lecturer was Mr. Banister Fletcher, A.R.I.B.A., and the examiner was Professor W. R. Lethaby, of the Royal College of Art. The lectures will be continued next session, the first being given on Monday, October 6, at seven o'clock.

**The Competition** recently held for the London Baptist Association church, Mitcham Lane, Streatham, S.W., has been

decided in favour of the design marked "New Era," the authors being Messrs. G. Baines & R. P. Baines, 5 Clement's Inn, Strand. The first portion of the buildings, which includes the nave, tower, vestries and temporary apse, is to be at once proceeded with. The estimated cost of the complete block is 5,238*l.*, without tower, the latter being 440*l.* extra.

**The Foundation-stone** has been laid of an obelisk which is to be erected on Plymouth Hoe as a memorial of Prince Christian Victor and the West-country soldiers who fell in the war. The memorial, which is of granite, is 43 feet in height with bronze panels on each of its four sides. One of these, by Mr. Emil Fuchs, is dedicated to the memory of Prince Christian Victor, while the others, by Mr. Onslow Whiting, depict the charge of the Devons at Waggon Hill and the Gloucester and Somerset Regiments in action.

**M. Ernest Dubois** has completed the statue of Bratiano, the Roumanian hero, which is to be erected in Bucharest.

**Mr. George Harry Pownall** (erroneously described in the Probate Registry Calendar as George Henry Pownall), of 83 Onslow Square, and formerly of 29 Parliament Street, architect, has left property valued at 26,278*l.* 6*s.* 1*d.* gross, 25,501*l.* 19*s.* 4*d.* net.

**Professor Uphues**, the sculptor, will go to America at the Kaiser's wish, and superintend the erecting of the statue of Frederick the Great which His Majesty has presented to the City of Washington.

**Mr. Francis Williamson**, sculptor, Esher, has been commissioned to execute three colossal bronze statues of the late Queen Victoria for the North-West Provinces, India. At present he is engaged on one of the late Sir George Grey, for Auckland, New Zealand.

**A Considerable Portion** of the old Wear music hall, Drady Lane, Sunderland, collapsed last week. The building, which is of large proportions, has not been used as a place of amusement for many years. There is a spring of water under the hall, and the foundations had evidently become undermined.

**The St. Petersburg Novoe Vremya** states that there exists in Russia an exact replica of St. Mark's Campanile. It was built about 130 years ago by the Empress Catherine II., and crowns the convent at Narechta, in the Government of Kostrowa.

**Signor Boni**, to whom has been entrusted the work of clearing away the ruins of the Campanile at Venice, states that there need be no question as to the possibility of rebuilding the structure. The foundations are all intact, and the work can be completed in five years at a cost of 5,000,000 lire. Of this sum 1,500,000 lire has already been subscribed, and the balance will be found by the Italian Government if necessary.

**The Cathedral** of Gothenburg has fallen into so dangerous a condition, it is likely to be demolished.

**A Full-sized Model** of the Sphinx is soon to be brought from Paris to London, where it will be placed on exhibition. The work was carried out by Madame Longworth in two years.

**A National Memorial** is to be erected in Adelaide to commemorate the South Australians who have been engaged in the South African campaign. It is likely to take the form of a mounted trooper, and a model has been prepared by Mr. Adrian Jones which has met with approval both in London and Adelaide.

**The Society of Arts** will next year offer the usual prizes for designs of furniture in connection with the Owen Jones Memorial Fund.

**A Committee** of the Royal Academy, with Sir Edward Poynter as chairman, have undertaken the organisation of the British section of Fine Arts in the St. Louis Exhibition of 1904. There will also be an educational exhibition arranged by the Board of Education.

**The American National Academy of Design** will henceforth be open to students, who will pass a preliminary examination, without the payment of any fees. Larger endowments will have to be made by the State to uphold the various schools.

**The Parish Church** of St John the Baptist at Little Marlow, Bucks, portions of which date from the year 1190, is being restored. The tower is acknowledged as being among the finest examples of Norman architecture in the county. It has, however, been pieced with friable and broken stucco to such an extent that its appearance was rendered somewhat unsightly, while the breaking away of the stonework rendered it dangerous to passers-by.

**The Expenditure** at the Liverpool docks during the past year has been 1,315,853*l.* 8*s.* 2*d.* The wages bill has at times exceeded 11,600*l.* per week, and the number of men employed has been upwards of 8,000 at a time. These figures are exclusive of payments to contractors, and do not include the men employed by them.

THE

**Architect and Contract Reporter.****EDITORIAL NOTICES.**

*In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.*

*The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.*

*The authors of signed articles and papers read in public must necessarily be held responsible for their contents.*

*No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.*

*Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.*

**TENDERS, ETC.**

*\*\* As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

**COMPETITIONS OPEN.**

**BERMONDSEY.**—Sept. 16.—Designs are invited for artisans dwellings to be erected on land at Rotherhithe, within the borough of Bermondsey, and known as the Fulford Street area. Premiums of 100*l.*, 60*l.* and 40*l.* will be awarded. Mr. Fredk. Ryall, town clerk, Town Hall, Spa Road, S.E.

**BIDEFORD.**—Sept. 25.—The Town Council of Bideford are about to erect municipal offices and a public library upon a site opposite the west end of the Long Bridge, Bideford, and they invite designs for the proposed buildings. Premiums of 30*l.*, 15*l.* and 10*l.* respectively are offered for the designs which shall be placed by the Council first, second and third in order of merit. Designs and descriptions, &c., are to be delivered to Mr. Wm. B. Seldon, town clerk, 18 The Quay, Bideford.

**DEPTFORD.**—Aug. 30.—Competitive designs are invited for a town hall and municipal offices. Premiums of 100*l.*, 75*l.* and 50*l.* are offered for the three selected designs. Mr. Vivian Orchard, town clerk, Municipal Offices, 20 Tanner's Hill, Deptford S.E.

**INDIA.**—Nov. 1.—Competitive designs are invited for the erection of a memorial to Her Majesty the late Queen Victoria at Allahabad. A premium of 2,000 rupees will be awarded to the design selected by the committee. Mr. H. Nelson Wright, Indian Civil Service, honorary secretary, Queen Victoria Memorial Fund Committee, Allahabad, India.

**LIVERPOOL.**—Sept. 15.—Designs are invited for new labourers' dwellings to accommodate about 2,500 persons, to be erected on the Hornby Street area. Premiums of 250*l.*, 150*l.* and 100*l.* respectively are offered for the first three selected designs. Particulars will be supplied by the Town Clerk.

**MAIDENHEAD.**—Oct. 1.—Designs for free library. Premiums offered of £50, £20 and £10 respectively. Mr. John Kirk, town clerk, Guildhall, Maidenhead.

**SOUTHEND.**—Sept. 7.—Designs are invited for a church to accommodate 500 persons, a clergy-house, and a parochial hall or parish-room about 50 feet by 30 feet. Mr. C. H. J. Talmage, Kathleen Villa, Southchurch Road, Southend-on-Sea.

**SUNDERLAND.**—Aug. 30.—Designs are invited for proposed police and fire-brigade buildings to be erected in Gill Bridge Avenue and Dun Cow Street. Premiums of 100*l.*, 50*l.* and 25*l.* are offered for first, second and third designs respectively. Mr. Fras. M. Bowey, town clerk, Town Hall, Sunderland.

**CONTRACTS OPEN.**

**BAILDON.**—Aug. 28.—For erection of farm buildings and windmill at Ash House Farm, Faweather, near Baildon, Yorks. Messrs. Joshua Robertshaw & Son, architects, 55 Tyrel Street, Bradford.

**BIRKENHEAD.**—Aug. 26.—For erection of offices at the tramways depôt, Laird Street. Mr. Chas. Brownridge, borough surveyor, Town Hall, Birkenhead.

**BLACKPOOL.**—Aug. 30.—For additions to destructor works. Mr. John S. Brodie, borough engineer, Town Hall, Blackpool.

C. & W. Menzies, plasterer.  
W. Fordyce, painter.

TRADE NOTES.

THE new infirmary, Swindon, Wilts, is being warmed and ventilated by means of Shorland's patent Manchester stoves, with descending smoke flues, by Messrs. E. H. Shorland & Brother, of Manchester.

SUN FANS for ventilating and other purposes are, as its style would suggest, the specialty of the Sun Fan Company, Ltd, who supply the fans in all dimensions, to be driven by belt or electricity, and all particulars concerning these will be found in the new price list (in two sections) which the company are sending out.

DRURY LANE THEATRE, Sunderland, collapsed on Sunday, the 17th inst. For some time past a spring of water has caused the flooding of the pit, and this is supposed to have undermined the foundations. Four houses on the opposite side of the street were demolished by the falling ruins, but luckily all were unoccupied.

**ELECTRIC NOTES.**

THE Clacton-on-Sea Council have decided to retain the electric-lighting order in their own hands, instead of leasing it to a company.

THE Louth (Lincolnshire) Corporation have under consideration a scheme for the erection of an electric-light and power works, at a cost of 10,000*l.*, on land in the centre of the town belonging to the Corporation. The electric-lighting committee recommend the carrying out of the work, and a provisional order has been obtained.

At a meeting of the Greenock Corporation, Bailie Cameron, in submitting the electricity accounts, which showed a deficit of 1,390*l.*, stated that it was almost impossible to make electricity works pay during the first few years. He was glad, however, to be able to inform the members that during the last six months the works had paid their way. The accounts were approved.

At a meeting of the Gainsborough Urban Council, a report by the clerk was considered upon the notices received from the Electric Supply and Traction Company and the United Electric Light and Power Company of their intention to apply for orders to supply electricity for lighting and power within the urban district. The clerk reported that similar notices had been received in 1900 from other companies, when the Council proceeded to give notice of applying to the Board of Trade for leave to supply electricity in their district. Plans were deposited, but no further steps were taken. The remainder of the report was practically a recommendation to the Council to apply for power to supply electricity within their district. After some discussion, it was decided to instruct the clerk to take the necessary steps to obtain a provisional order.

THE Board of Trade have received, through the Foreign Office, from His Majesty's Commercial Attaché at Shanghai, a copy of an advertisement issued by the Municipal Secretary at Tientsin calling for proposals for the lighting of the British concessions by electricity, which reads as follows:—"The British Municipal Councils, in accordance with the terms of the resolution passed at the general meeting of landowners, &c., held on May 2, 1902, are now prepared to receive proposals for the lighting of the concessions by electricity, such proposals to be submitted not later than November 30 of this year." It is signed by Mr. A. W. Harvey Bellingham, A.M.I.C.E., secretary and engineer. It is understood that no details or specifications will be furnished.

COLONEL LANGTON COKE, C.E., held an inquiry at Nantwich on the 20th inst. with regard to an application by the Urban Council to borrow 12,505*l.* for electric-lighting purposes and 1,275*l.* for the erection of a refuse-destroyer. Evidence in support of the application was given by the clerk and surveyor to the Urban Council and by Mr. Peers, electrical engineer of Manchester. The scheme provides for the erection of generating works and a refuse-destroyer on the Council's sewage farm close to the town, and for the same motive power to be used for both purposes. A memorial from manufacturers and tradesmen complaining that they were unable to compete with manufacturers and tradesmen in other towns owing to the excessive price charged for gas was read in favour of the scheme. The annual payments were estimated at 1,932*l.* and the income at 2,440*l.*, this sum including 2,250*l.* which it was anticipated would be derived from the sale of electricity to the public at a charge of 6*d.* per unit. Mr. Wm. Harvey, a former member of the Council and a large ratepayer, whilst approving the erection of a destructor, strongly objected to the introduction of the electric light. Mr. Cummings and Mr. Bower, architect, also opposed the application, and in closing the inquiry Colonel Coke promised that the representations made should be placed before the Local Government Board.

**BUILDING AND BUILDERS.**

A NEW Roman Catholic church is in course of erection in Liverpool Road, Irlam. It will cost, with furnishing, upwards of 3,000*l.*

THE external walls of Halesowen parish church are being restored at a cost of 2,000*l.*, and it is hoped that the work will be completed by October.

THE foundation-stones of a Primitive Methodist church have been laid at Swalwell, near Gateshead. The church will provide accommodation for 250 worshippers, and will cost over 1,000*l.* The schoolroom is to be erected at a later date.

THE ancient parish church at High Wycombe (Bucks) is to be enriched by a handsome window placed there in commemoration of the Coronation. The church is the largest edifice in Buckinghamshire, and is known as the "Cathedral of Bucks."

AN accident has occurred whereby a joiner named William MacKay was very seriously injured. While five men were

# CABOT'S INSULATING & DEAFENING QUILT

**A PERFECT DEAFENER.**

Prevents the transmission of sound through walls and floors by absorbing and breaking up the sound waves. The only deafener that does this. Send for Special Book on Schoolhouse Acoustics, illustrated.

**A SCIENTIFIC INSULATOR.**

Contains innumerable minute dead-air spaces, giving highest insulating power. Warmer than back-plaster or six layers of rosin paper. Decays, moth, and vermin-proof, and unflammable.

**FIREPROOF, DEADENING.**

A fireproofing result infinitely superior that obtained with sheet asbestos, and practically perfect sound-deadening, can be had in all kinds of buildings by using

**CABOT'S ASBESTOS "QUILT."**

The only scientific deafener. Indestructible by decay, moths, or vermin.

	Per Bale.	Half Bale
Single Ply ...	£1 : 11 : 0	£0 : 17 :
Double Ply...	1 : 16 : 6	1 : 0 :
Asbestos ...	2 : 16 : 6	1 : 10 :

Bales containing 500 square feet each; half-bales 250 square feet. Weights: Single ply, 80 lbs.; Double-ply, 120 lbs.; Asbestos 190 lbs. per bale.

## CABOT'S CREOSOTE STAINS, FOR EXTERIOR WORK.

Unequalled for depth and freshness of colour, durability, wood-preserving properties, and freedom from blackening. Superior to paint for exterior woodwork, and **fifty per cent. cheaper.** One gallon will cover 100 square feet of surface, two brush coats.

engaged at the taking-down of the old Scoonie parish church, Leven, N.B., one of the heavy rafters suddenly gave way, and all the men fell a distance of 25 feet. MacKay was conveyed home, and lies in an unconscious state. A boy named Kerr had his leg injured, while the others got off with cuts and bruises.

THE death occurred on the 13th inst. of Mr. Charles H. Beloe, C.E., Liverpool, who carried out many important works in various parts of the country. He was regarded as an expert in drainage matters, and acted as engineer to the International Water and Sewage Purification Company of London. He was author of several standard treatises on construction of reservoirs and town water supplies. Deceased was an officer in the Engineer Volunteers and a member of the Liverpool City Council.

## VARIETIES.

THE new County Sanatorium which has nearly been completed by the Urban District Council of Malvern, will be opened early in September.

A GERMAN invention of a new fire ladder was exhibited last week most successfully at Messrs. Whitbread's yard, Chiswell Street, E.C.

THE Pontefract Primitive Methodist chapel has been reopened after the expenditure of several hundred pounds on redecoration, &c.

IN addition to the memorial to the Duke of Westminster in Chester Cathedral, which was recently inaugurated, a monument is to be erected in the church of St. Mary-without-the-Walls, Chester.

THE new church erected on the north side of the Stewart Avenue, Bo'ness, to meet the growing wants of the Catholic

community has been formally opened. The building, erected at a cost of over 2,000*l*, will also be used as an elementary school, four classrooms being provided to accommodate 250 pupils.

AT the half-yearly meeting of the Central Board of the National Association of Master Plumbers of Great Britain and Ireland at Huddersfield, the president, Mr. W. L. Harrison, R.P., read a report of the work of the educational committee with reference to the form of indenture for apprentices which had been drawn up in conjunction with the Worshipful Company of Plumbers. Hitherto there has been great laxity in the trade throughout the country respecting apprentices. The form of indenture was adopted providing for a seven years' apprenticeship, unless the lad has been previously pursuing his education to fit him for his trade at a technical school on conditions varying according to localities.

A LIMITED competition for the Carnegie library at Coat-bridge has just been decided. Mr. T. L. Watson, architect, Glasgow, was selected as assessor, and advised the committee and the Town Council throughout the competition. On his recommendation the plans of Mr. Alexander Cullen, Motherwell, were adopted from among ten sets submitted, and premiums were awarded to Messrs. A. N. Paterson, Glasgow; George Arthur & Sons, Airdrie & Alexander MacGibbon, Glasgow. One competitor was disqualified, his design being much in excess of the limit of 10,000*l*.

AT a meeting of Ayr School Board, in committee, the six sets of plans submitted in competition for the new school were considered, together with a report by a measurer. It transpired that the original estimate of 9,000*l* had been exceeded in every case, the lowest, that of Mr. John Arthur, architect, Ayr and Glasgow, being 11,113*l*. By five votes to four Mr. Arthur's plan was selected. The minority voted for the plan of Mr. John Eaglesham, architect, Ayr, which was 1,800*l* dearer than that of Mr. Arthur.

ON the 11th inst. the foundation-stone was laid of the new Sunday-school which is being erected in connection with Christ Church, Buckingham Road, Tuebrook. The building when completed will accommodate 250 children. It will be of brick and of neat design, with classrooms, in addition to a large main room, and besides being used as a Sunday-school it is intended to be utilised for other parochial purposes. Mr. Harding is the architect, and the builders are Messrs. W. Caird & Son. The cost will be about 400*l*.

AN exhibition of old and interesting bells will be opened in the Museum, Elgin, on Saturday. The collection will include bells cast in France, Flanders, Elgin, Old Aberdeen, &c., from the fifteenth century. Contributions will appear from Elgin (the prayer bell of St. Giles, 1504), Birnie (the quadrangular Rounel bell), Duffus (Flemish bell of fifteenth century), Dyke (French bell of sixteenth century); also from Glass, Botriphnie, Rafford, Edinkillie, Kinloss, &c. Mr. F. C. Eeles, Stonehaven, sends casts of inscriptions of bells and rubbings of Northern bells, as the "Wow o' Rivven"; also a series of inscriptions on English bells from the earliest times to the present day. The exhibition will remain open for a week.

### STREET IMPROVEMENTS IN YORK.

AN inquiry has been held by Mr. R. H. Bicknell into the application of the City Council to borrow 10,340*l.* for street improvements, and 2,630*l.* for a refuse destructor and depôt. The following are the parts to be improved:—Bishophill Junior, 370*l.*; Nessgate, 5,600*l.*; Coppergate, 620*l.*; College Street, 2,850*l.*; High Petergate and St. Leonard's Place, 900*l.* Nessgate is a short narrow thoroughfare in the centre of the city, through which a large portion of the traffic for Fulford and the East Riding must necessarily pass. The tramway for the Mount district also runs through it, and the traffic is very congested. It is most important, therefore, that the thoroughfare should be widened. The Corporation have already acquired some of the property in the street, and the remainder for which sanction to borrow the money is required comprises the Star and Garter public-house and two adjoining shops. The fee simple of this property it has been arranged to purchase for 5,500*l.* The area to be purchased is 190 square yards, of which 146 square yards are required for the improvement, leaving 44 square yards available for resale. The Corporation have also entered into a provisional agreement by which they will be able to acquire so much of the site of the Coach and Horses hotel at the corner of Nessgate and Low Ousegate as will enable them to complete the scheme by effecting an appreciable widening at that important corner. The amount required for the Coppergate improvement is to enable the Corporation to purchase the reversion of a shop at the corner of Nessgate and Coppergate, in which they already hold a leasehold interest. When they have obtained this they will be enabled to effect the much-needed widening of Coppergate, and

thus materially relieve the traffic in Nessgate and High Ousegate. The College Street improvement involves the making of a new street from Goodramgate to Minster Yard. Early in 1899 the Local Government Board sanctioned the borrowing of money for the purchase of property immediately adjoining the ancient archway in College Street for the purpose of widening that thoroughfare. In order to effect the improvement it would have been necessary to have acquired some further property of the Dean and Chapter of York Minster. The Minster authorities were very much opposed to the scheme, especially as they were advised that the heavy traffic would endanger the safety of the east end of the Minster, and ultimately it was decided to construct a new street from Goodramgate to Minster Yard, and arrangements were made with the Dean and Chapter for the purchase for 1,060*l.* of the fee simple of the land (1,366 square yards). The Corporation are also to erect the necessary fences, gates, boundary walls and re-erect outbuildings and other works on the property of the vendors which may be affected by the making of the proposed new street. The 2,850*l.* required to be borrowed is calculated as follows:—Purchase money, 1,060*l.*; cost of making new road, 1,043*l.*; building walls and erecting palisadings, 747*l.*, &c.

### WORKMEN'S COMPENSATION ACTS.

THE statistics of proceedings issued by the Home Office shows that the number of cases under the Workmen's Compensation Acts dealt with in England and Wales by County Court judges and County Court arbitrators tends to increase, the totals for the three years 1899, 1900 and 1901, being 999, 1,145 and 1,370 respectively. The extension of the Act to agriculture accounts for only 11 of 1,370 cases in 1901. The number decided by judges has increased from 828 to 1,046 to 1,289, while the number of cases in which it was necessary to appoint a special arbitrator has fallen from 98 and 29 to 9. The cases settled by acceptance of money paid into Court numbered 73, 70 and 72. In addition to these there were 348, 407 and 548 cases which were either withdrawn, settled out of Court or otherwise disposed of in such a way as not to enable the officials of the Court to state definitely the results.

Of the claims for compensation finally settled in 1901 within the cognisance of the Courts, the decision in 1,007 cases was in favour of the applicant, and in 167 in favour of the respondent. The proportion of cases in which the applicant

WM. E. PECK & Co.  
8, BRADFORD AVENUE.  
LONDON, E.C.

successful has, therefore, increased from 75 per cent. in 1899 and 81 per cent. in 1900 to 86 per cent. in 1901.

In 399 cases the award was a lump sum; in 608 a weekly payment. Both figures show a progressive increase as compared with the two previous years. In the cases of weekly payments, while the weekly rate can be given, the length of time for which the payments were or will be made cannot be ascertained except in a few cases, and it is, therefore, impossible to attempt any complete statement of the capitalised value of the grants of compensation.

In 301 cases the compensation was awarded on account of death, and in all of them the deceased had left dependents. The total amount so awarded was 56,702l. 3s. 7d., a considerable increase over the total figures for the two previous years, and the average award in each case has risen from 173l. 1s. 7d. in 1899 and 163l. 8s. 9d. in 1900 to 188l. 7s. 7d. in 1901.

With regard to the grants of compensation for injury, there were 98 cases in which the compensation is returned as consisting of a lump sum. In 19 of these cases the plaintiff accepted money paid into Court. In the remaining 79 cases a lump sum appears to have been awarded by consent of the parties. The average was 32l. 5s. 1d.

In 608 cases of injury a weekly sum was assigned, 345 being cases of total and 263 cases of partial incapacity. The average rate of weekly allowance for the last three years has been, in case of total incapacity, 10s. 11d., 11s. 6d., 11s. 10d.; in the case of partial incapacity, 9s. 2d., 10s. 9d. and 9s. 8d.

The number of cases under the head of building to which the Acts of 1897 and 1900 apply were as follows:—1899=159; 1900=151; 1902=243.

During the year 1901 the County Courts in which there were the greatest number of arbitrations under the Workmen's Compensation Act were Bow 83, Liverpool 76, Manchester 66, Birmingham 59, Pontypridd 58. The number of cases under the Employers' Liability Act is very much greater at Bow than at any other County Court, the figure being 141 for Bow as compared with 31 for the next highest (Manchester).

The tendency in the metropolitan courts to proceed under the Employers' Liability Act, in preference to the newer statute, is even more marked than in previous years. In circuits 40, 41, 42, 43 and 44, and in the City of London court, there were 301 cases under the Employers' Liability Act, against 201 under the Workmen's Compensation Act, while for the rest of England and Wales the figures are 289 under the former and 1,717 under the latter. There were 268 courts in

which there was no case under either Act. Of the 1,636 memoranda registered, 214 were in the Stokesley and Guisborough county court, 99 in Middlesbrough, 137 at Bow, 91 at Manchester and 75 at Pontypridd.

The number of cases under the Workmen's Compensation Act carried to the Court of Appeal in England was 61, or a little more than 3 per cent. of the cases that came before the county courts. This is a considerable decrease as compared with 1900, when the figure was 90, or nearly 6 per cent. In Scotland also the number of appeals has decreased from 32 to 23. Of the 61 appeals 22 were appeals by workmen and 39 by employers. Of the former 6, of the latter 7, were successful.

The list of appeal cases which was given in the returns for 1899 and 1900 has been continued for the year 1901, and, as in previous years, a brief note showing the point in the Act on which the appeal arose has been inserted in all cases in which it could be ascertained. It will be found that there are eighty-six cases in which the point at issue is stated, including eighteen noted as involving two or more points each. In thirty of the eighty-six cases the question was at issue whether the workman's employment was one to which the Act applied. There were three appeals to the House of Lords as compared with seven in 1900. In all these cases the workman was the appellant. Only one was actually carried to a hearing.

Speaking generally, a comparison of the returns for 1901 with those for the years 1899 and 1900, the first two complete years when the Act was in force, does not show any great change in its operation.

The number of appeals on questions of law has, however, diminished considerably—the figures for the three years are 54, 90 and 61—and there seems therefore reason to hope that progress has been made towards the definite settlement of the legal difficulties in the interpretation of the Act of 1897. In an Act dealing, as this Act does, with entirely new matter, the legal questions to be settled are necessarily very numerous; and in view of the enormous range of cases to which the Act applies, it is reasonable to suppose that the great majority of these difficulties would come up for decision in the earliest years of its operation.

On the other hand, the number of cases brought to the county courts—in most of which it must be questions of fact that are at issue—still tends to increase. The figures are 1,347, 1,552, 1,918. But, even in view of this increase, the statement must be repeated that the cases which come before the county courts do not represent more than a very small proportion of

those in which compensation is paid under the Act. The great majority of claims are settled by agreement, and only a small percentage are made the subject of formal arbitration.

### STREET IMPROVEMENTS AT WOLVERHAMPTON.

MORE than a quarter of a century has gone by, says the *Birmingham Daily Post*, since the Wolverhampton Corporation obtained powers under the Artisans' Dwellings Act of 1876 to change the appearance of the centre of the borough, and the demolition of old buildings and the making of new streets have been not only beneficial from a health point of view, but have introduced a number of new and up-to-date business structures, which will vie in design and architectural development with any that can be found in the leading cities in the kingdom. Before the Act was passed Wolverhampton had, perhaps—within a small area and only a few yards distance from the principal square in the centre of the town—as many slum dwellings as any town in the country. The occupants were a disgrace to the borough and were a continual source of trouble to the police and other authorities; and it is satisfactory to be able to relate that since this part of the town has undergone alteration there has been a great diminution in the complaints that previously had to be dealt with. Great divergence of opinion existed at the time as to the wisdom of the local parliament in including in their Bill so wide an area for improvement purposes as they did, but in all probability in years to come the inhabitants will admit that while the cost has been very heavy, it was better to devise drastic sweeping away of old dwellings at the time than have to carry out a lot of patchwork arrangements to effect improvements at probably a heavier cost later on. Through the centre of the condemned area there has been cut a new Lichfield Street, which is a credit to the residents, as it has on either side some of the finest commercial and other buildings in the borough. It is the main thoroughfare leading from the two railway stations into the heart of the town, and the thousands of visitors to the Art and Industrial Exhibition have been surprised to see such a wide thoroughfare flanked by high and splendidly designed buildings. It is only, however, in very recent times that this street has fully been filled up with shops, offices and other structures. For a long time after it was laid out it presented a most desolate appearance, as few people could be induced to buy land and build upon it; but a

fillip was given to building operations when the late Alderman V. Jackson induced the post office authorities to remove the post office from Queen Street to Lichfield Street, and provide a building which is quite in keeping with the Grand Theatre, the Art Gallery and other architectural acquisitions to be seen in the immediate vicinity. The last and most noble looking venture to complete the line of buildings has just been completed. For twenty-three years the Corporation and the owners of a piece of ground in this street, with sides to Princess Square and Wulfruna Street, were unable to come to terms as to the character of the structures to be placed upon it, but the difficulty disappeared on the land being purchased by the Royal London Friendly Society on behalf of their investment and estate department, this being one of a number of buildings that are being erected in various commercial centres as investments for the funds of the Society, who have raised a palatial building which out-views any one of the kind in the town. The massive edifice is capped by an ornamental tower which stands out in bold relief above the adjoining elevations, and catches the eye at once of every person entering the town from the railway stations. The building has a stone exterior with some exquisite carved work dividing the various storeys; it is four storeys in height, and the material used internally is of such a character as not only to be soundproof, but almost fireproof, there being no woodwork in the partitions. While beautiful in design the main feature of the pile is the cosmopolitan character for which it will be used. There are ten shops in the ground floor with basements and sub-basements and fronting Lichfield Street, and entered at a semicircular door, provision is made for an hotel. It contains a wide entrance hall and staircase with passenger lift leading to the upper floors and basement. There is a spacious commercial dining-room, coffee-room, writing, reading and other rooms, and on the second and third floors are thirty-three bed and sitting-rooms, while the kitchens on the most modern principle will be placed on the floor above. The building also contains a public hall with stage and retiring-rooms for the performers; a suite of Turkish baths; and rooms for club or other purposes. The building, which has been erected by Messrs. H. Willcock & Co., of Wolverhampton, from plans prepared by Messrs. Essex, Nicol & Goodman, architects, of Birmingham, is a welcome addition to the many recent street architectural improvements, and is a ready answer to those croakers who will not see that the town is growing in population and importance at a

rapid rate. The total cost of the building will be over 30,000L., and the estimated rental value is placed at 1,500L. Another indication that outside speculators are of the opinion that Wolverhampton is likely to become a most valuable centre of industry may be seen in Dudley Street, where a syndicate is expending a large sum of money in erecting an arcade, which will extend from the street mentioned through John Street to Victoria Street, over a vast area of ground that has been partially covered with dilapidated dwellings for a period almost beyond the knowledge of any inhabitant. The entrance to the arcade is of a most ornamental design, and not only takes the place of a number of old shops, but is set back so as to widen the thoroughfare, and we understand that the syndicate are endeavouring to purchase a block of adjoining property so as to further improve the appearance of the street. The question of widening Dudley Street has occupied the attention of the Town Council for about thirty years, but the anticipated cost has always been a bar to the corporate authorities making what has been regarded for many years as an absolutely necessary improvement, and if a number of private gentlemen widen, and at the same time beautify the thoroughfare, it is certain that they will be granted the thanks of the residents, and especially the ratepayers, who will see as the outcome of the syndicate's venture an increase in the rateable value of the town. The arcade, which is only partially completed, is entered through a short, shop-fronted passage 14 feet wide, which is afterwards increased to a width of 17 feet. The shops on either side of the arcade are fitted with large plate-glass windows set in handsome frames of polished walnut. The centre of the building is broken by a "rotunda," with handsome glass dome, and here it is intended that a band shall be placed to not only attract customers but provide them with pleasurable entertainments. In the basement of the rotunda there will be a café. A number of other welcome street improvements have been, within a short period, proposed, and will be carried out shortly. Newhampton Road has been widened, beneficial work is to be carried out in Salop Street, North Street is being altered in a manner at the corner of Wadham's Hill that will enable vehicular and pedestrian traffic to proceed with greater freedom, and when the St. Peter's schools have been pulled down the wholesale market will be extended and a partly covered market and other acceptable alterations will be made in this part of the town, which will completely alter it in appearance. The rates of Wolverhampton are undoubtedly heavy, and the expenditure of the Town Council is at present on such a lavish scale as to cause some

of the residents to wonder whether with the existing bad trade they will be able to meet the demands of the authorities, but they have the satisfaction of knowing—as we have pointed out—that there are capitalists who are prepared to lay out their wealth in the town on new buildings, and this fact ought to encourage them to hope that the town will be far more prosperous in the future than it has been in the past.

#### ELECTRIC LIGHTING OF LARGE OFFICE BLOCKS.

In the present day, when the price of electric energy is comparatively cheap, it is not uncommon to find that current required for the lighting of large blocks of buildings in London is taken entirely from the electric street mains. An important addition to an already very large installation is that of the new Westinghouse Building and its annexe, comprising part of the Law Land Company's estate. The building consists of seven floors and basement, each floor being designed for about fourteen rooms. Three wire service mains are brought into the building by the Charing Cross and Strand Electricity Supply Corporation, the supply being by continuous current at a pressure of 200 volts at the lamps. The main distribution board is of enamelled slate mounted in a massive teak frame, and provides for a separate circuit to each floor of the building, each circuit being controlled by D.P. fuses and a S.P. chopper type switch. From this main board a separate circuit is run to each of the local distribution boards for supplying the various floors through the D.P. bridge type fuses. All lamp circuits are run back direct to distribution board, no fuses being employed locally. The maximum number of incandescent lamps supplied from any sub-circuit is eight, and with few exceptions every lamp is furnished with a separate switch. The wiring is carried out in Simplex brazed tube, all the tubes being fixed in position as the buildingwork proceeded, and the wires drawn in afterwards. Westinghouse Building contains upwards of 700 lights, together with a very elaborate and extensive system of electric bells for the tenants, and service gas fire points, speaking-tubes, &c. The total number of lamps now on the estate supplied is estimated at about 5,000.

The whole of the work is under the supervision of Mr. Frederic H. Taylor, C.E., Assoc. M. Inst. E.E., of 14 Victoria Street, S.W., the consulting engineer to the company, and it is always carried out by the electrical staff of the Law Land Building Department.

## REBUILDING OF SONNING BRIDGES.

THE quarterly meeting of the Oxfordshire County Council held at the County Hall, Oxford, on the 6th inst. The roads and bridges committee reported that an intimation was given in February, 1892, that the Sonning bridges would not withstand frequent heavy traffic or serious floods. The bridges form an important means of communication between the river leading to the river Thames at Eye and Dunsden on the Oxford side, and at Sonning on the Berkshire side, the nearest way of crossing the river being Caversham Bridge, about 3 miles on one side, and Henley Bridge, about 5 miles on the other side. At this point the river is about 300 yards wide and is crossed by a series of three county bridges, an iron-vening roadway, and the bridge over the navigable part of the river, which is not a county bridge. The three bridges repairable by the County Council are wholly in Oxfordshire, and consist of Mill Bridge, an old wooden structure over the Mill Stream, 188 feet in length; New Bridge, a brick and timber structure over a branch of the river, 139 feet in length; and Hall's Bridge, a wooden structure over a back channel, leading from the Weir, 111 feet in length—making a total length of 438 feet, the average width of all the three bridges being 15 feet. Several members of the committee inspected the bridges, in consultation with the county surveyor, when it was evident that new piles and supports were necessary, and a further examination resulted in forcing the committee to the conclusion that it would be useless to expend money upon the continual repairs of the old structures, and that a new and better bridge would eventually prove the most economical scheme. The committee have therefore decided to recommend the removal of the existing wooden lengths, the substitution of iron piles and steel girders, the strengthening of the present brick portions and addition of brick abutments at each end, and the widening of the bridges so as to insure a roadway of 24 feet. As it is most desirable to commence the work before the winter months, the committee request that they may be authorised to obtain and accept tenders, and to employ the county surveyor to undertake the rebuilding of the bridges according to the plans prepared by him, at a cost not exceeding 8,000/.

Sir W. Markby said the beauty of the Thames was a valuable possession of the county, and he was afraid that would be totally destroyed if the old bridges at Sonning were replaced by girder bridges. It would not be a great expense to preserve the ancient character of the bridges.

## ART PLATES FROM "THE ARCHITECT."

Awarded Gold Medals, International Health Exhibition and Architectural and Building Trades Exhibition (1889.)

PROOFS on PLATE PAPER of the following Illustrations which have appeared in "THE ARCHITECT" can now be obtained in a separate form on proof paper suitable for Framing.

**THE EXALTATION OF ART.** (Ceiling Painting in the Hôtel de Ville, Paris.) By Mons. LÉON J. F. BONNAT. (Printed in oil.) Size, Twenty Inches by Fifteen Inches. Price, One Shilling; free by post, carefully packed inside patent roller.

**MASTER BUNBURY.** From the Painting by Sir JOSHUA REYNOLDS. Size, Twenty Inches by Fifteen Inches. Price, One Shilling; free by post, carefully packed inside patent roller.

**ST. PAUL PREACHING AT EPHEBUS.** By EUSTACHE LE SUEUR. From the Painting in the Louvre. Printed in black. Size, Thirty Inches in depth by Twenty Inches in width. Price, Two and Sixpence each; free by post, carefully packed inside patent roller.

**A TURKISH MASSACRE.** From the Painting by EUGÈNE DELACROIX. Size, Thirty Inches by Twenty-two Inches. Price, Two and Sixpence each; free by post, carefully packed inside patent roller.

**AN ITALIAN GIRL.** By WALTER BLACKMAN. Size, Thirteen and a Half Inches by Nine and a Half Inches. Price, Sixpence each; free by post, carefully packed inside patent roller.

**PANELS BY F. BARTOLOZZI, R.A.** After J. B. CIPRIANI, R.A. Printed in the famous Bartolozzi red. Size, Twenty-four Inches in length by Fifteen Inches in depth. Price, Three Shillings and Sixpence the Pair; free by post, carefully packed inside patent roller.

**THE ROMANS OF THE DECADENCE.** From the Painting by THOMAS COUTURE. Size, Twenty Inches by Fourteen and a Half Inches. Price, One Shilling and Sixpence; free by post, carefully packed inside patent roller.

**THE GALLAND FRIEZE.** From the Wall Paintings in the Hôtel de Ville, Paris, by P. V. GALLAND. Eighteen pieces printed in black on Cotta with Gold background.

No. I. ARCHITECTURE.	No. VII. POTTERY.	No. XIII. TURNING.

Size of each Plate, Twenty Inches in length by Thirteen and a Half Inches in depth. Price, Twenty-five Shillings the set of eighteen pieces; free by post, carefully packed inside patent roller.

May be obtained from all Newsagents, Booksellers, Messrs. W. H. SMITH & SON'S Bookstalls, or from the Publishers, GILBERT WOOD & CO. Ltd., 6-11 Imperial Buildings, Ludgate Circus, London, E.C.4.

Lord Saye and Sele thought the Council ought to have the of the county surveyor before them. It was proposed to t three bridges at a cost not exceeding 8,000*l.*, and he d not help thinking the character of the three auxiliary ges would be much better maintained if the old timber ctures were in some way renewed. This would tend to p up the appearance of the beautiful village of Sonning and d save a great expense to the county.

Mr. Ashhurst said the question was thoroughly gone into he county surveyor, and it was found impossible to repair old bridge. He thought the recommendation that had arrived at was the only way to come to a definite conclu-

The new structure had been carefully considered, and would like to work on the lines of the old bridge.

Sir W. Markby thought that a brick bridge would not be gely as an iron bridge.

Alderman D. Blount said if the present bridge was going to altered, the Thames Conservancy would require a wider erway by the removal of the existing piers, which were a nt obstruction to the flow of the water.

Mr. Brakspear pointed out that the question had been oughly considered. The plans might be altered if a fair was paid by the Thames Conservancy and the obstruction sed by the piers removed.

The Earl of Jersey said he did not like opposing the report ny committee, but it seemed to him when they were iding such a large sum on the bridge it was desirable that abers of the Council generally should have some idea of t was going to be done. The plans would have to be mitted to the Thames Conservancy, and further additions ht, be insisted upon. He suggested that the question d be deferred until the next meeting.

The Chairman did not think it was any use for a large nt to look over plans. The reason for the report was the e of losing a season.

A Councillor: Is it necessary to do the work this year?

The Chairman: I am afraid the bridge is in a dilapidated e, and no one can tell what would happen if we put the k off for a season.

The County Surveyor: There is always a risk. The present ge would go with anything like a heavy weight.

Alderman D. Blount: You will have to get the consent of b Thames Conservancy, and they do not meet again until ober 6.

Mr. Neighbour said Alderman Blount seemed to be under

the impression that the proposal referred to the bridge going over the main stream. That was not the alteration proposed. The new bridge would go over that part of the river which took the overflow water at the side. So far as the waterway was concerned, what was proposed was to do away with the forest of piles that carried the bridges and caught and accumu- lated everything brought down. What was desired was an uninterrupted waterway.

Alderman Newton said if the work was not proceeded with great expense would have to be gone to in the shape of repairs.

The Earl of Jersey asked if the consent of the Thames Conservancy would be necessary with regard to these improve- ments. If that was necessary it was obvious that could not be obtained until October 6.

The County Surveyor said between now and October they would be dealing with a great part of the bridge that did not affect the waterway. He had a doubt as to whether the Thames Conservancy had anything to do with it, but he was sure the waterway would be so improved that October 6 would be quite soon enough for their permission, because they would not touch the pile bridges with which the Conservancy were concerned.

Sir W. Markby seconded the Earl of Jersey's amendment.

On a division sixteen voted for the amendment and seven- teen against. The report of the committee was then agreed to.

### ABERDEEN HARBOUR WORKS.

THE Harbour Commissioners spent a busy afternoon last week in the annual inspection of the extensive works under their care. They visited first the operations at Regent Bridge, which is now almost ready for the erection of the steelwork and machinery. It has been arranged that the bridge will be swinging and the railway traffic across docks commenced by August of next year. The new bridge, which will cost about 50,000*l.*, is only part of a big dock improvement scheme, which will involve an outlay of 104,000*l.* Continuing their walk southwards the Commis- sioners next saw the work in progress for the reconstruction and widening of the Commercial Road wharf, for the extension of the fish market. Built originally for the smaller class of trawlers, this quay has become entirely inadequate for the require- ments of the larger class of vessels now being built for the fishing industry. Provision is also being made for a depth of 16 feet at low water of spring tides. These improvements will cost 17,000*l.*, but they do not exhaust the arrangements in contemplation for the accommodation of this now great industry. By the recent

purchase, at an expenditure of 50,000*l.*, of ground on the south side of the Dee, the Commissioners will be able when necessary to double the facilities at present existing for the fish trade. The visitors, on passing the pontoon dock in the Albert basin, observed from the signboard that the vessel at present undergoing repairs there is the 710th since the dock was acquired about two years and four months ago. The engineer is at present engaged on a report showing the need of extra docking accommodation. The Commissioners then saw the graving dock, harbour workshops and the recent reconstruction of Provost Matthews's quay. In passing to inspect the outer sea works in a steam tug the party witnessed the dredging operations which are destined to give an additional depth of 5 feet of water along the whole length of the navigation channel, the work being carried out in rock. Not the least interesting of the schemes now on hand is that connected with the tunnelling of the Dee, whereby the whole of the city sewage will be carried in a large syphon under the river and discharged at Girdleness. This is a most difficult operation, but every precaution has been taken for its safe execution, and the tunnel has been placed at such a low level that it may not hamper the expansion of the dock system. The harbour engineer, Mr. R. Gordon Nicol, C.E.; his assistant, Mr. Simpson; Mr. Ross, harbour treasurer; and Captain Crombie, harbour master, accompanied the Commissioners, and gave explanations regarding the progress of the various works on hand.

### TRADE IN NORWAY.

THE report on the trade and commerce of Norway for the year 1901, by Mr. Consul-General Dundas, states that the exportation of timber during the year has been very much less profitable to exporters than in 1900. Prices declined at the beginning of the year and so continued, the fall ranging from 25 to 40 per cent. The following figures give the total export of timber from Christiania in 1901:—

	Quantity. Cub. Metres.
Planned timber . . . . .	77,614
Sawn " . . . . .	57,681
Hewn " . . . . .	2,569
Round " . . . . .	59,862
Staves, &c. . . . .	2,502
Laths . . . . .	534

Being altogether 30,793 cubic metres less than in 1900, or about 10 per cent.

Owing to the diminished activity of the building trade in Christiania in the past year the local consumption of timber has been proportionately reduced. The establishment also of several new planing mills has occasioned a number of failures, and it may safely be said that this branch of the business has been overdone. With a view to improving the market, Mr. Vice-Consul Thiis, at Frederikstad, the centre of the timber trade, reports that the members of the Norwegian Floor Association have agreed to restrict their purchases of logs to the extent of 33 per cent. Mr. Vice-Consul Franklin, at Bergen, echoes the general complaint as to unsatisfactory results during the year which occasioned losses to exporters, especially as selling prices in the United Kingdom and on the Continent were not at all proportionate to cost of wood. But the shipment of the log stocks for autumn 1902 and spring 1903 will be curtailed in consequence of the smaller log cutting during the past winter that the supply and demand will be in favour of the timber merchant.

The United Kingdom is by far the largest consumer of Norwegian timber and timber products, taking over two-thirds of the total value of the exportation of unworked timber, manufactured and manufactured timber, Belgium, France and Germany coming next.

The export of granite is chiefly to the United Kingdom, and is said to have increased considerably of late, especially hewn granite for paving stones. Both in regard to the quantity and prices there is little difference compared with 1900. The German consumption of granite has, however, decreased, and, as a view, it is asserted, to develop her own quarries. The chief centre of the granite production is in Smaaleene. During the year a union has been formed among the Norwegian exporters of kerb stones to the United Kingdom.

Of other kinds of stone exported may be mentioned scabbled stone ("klæbersten"), which is used in buildings chiefly for ornamental purposes, and which is most durable, unaffected by heat or cold; marble; felspar, which goes principally to Germany and France; and quartz. But Christiania is so much interested in this branch of exportation. The total quantity of hewn stone exported to the United Kingdom in 1900 was 68,265 tons.

The building trade, which had declined in 1899 and 1900, showed signs of revival last year, the number of new buildings registered amounting to 922, against 764 in 1900. Of these

number quoted, 112 were dwelling-houses and 21 business or factory buildings. During the course of the year the building authorities passed 105 new dwelling-houses, and the whole number of new additional dwellings amounted to 1,226. At present time a considerable number of dwellings, as also of business premises, are standing empty, and as a consequence values have fallen considerably. Property has likewise suffered depreciation, and only 13 new companies, with a capital of only 27,500*l.*, for the purpose of buying up properties, were entered, against 52 new companies, with a nominal share capital of 543,956*l.*, in 1900. Of the companies registered last year, one with a capital of about 5,500*l.* was for the purpose of speculating in property at Ofoten.

## VENTILATION OF THE KAISER'S NEW YACHT "METEOR III."

The new racing yacht, *Meteor III.*, built in America for Kaiser Wilhelm, the German Emperor, and christened by the President's daughter, Miss Roosevelt, is, as was to be expected, fitted with the very latest improvements and up-to-date in every respect. The ventilation, so defective in many high-class yachts, has not been overlooked, its importance being fully recognised, not only in so far as the comfort and health of those on board are concerned, but the internal timber fittings, store-hold, sail-closets, &c., are also kept in good and sound condition, even when damp sails are stowed away, by the constant circulation of air, which is effectively preventing mildew, dry-rot and the unpleasant smells generally experienced "below" on such craft when imperfectly ventilated.

The "Boyle" system of ventilation (natural), supplied by Messrs. Robert Boyle & Son, Ltd., ventilating engineers, London and Glasgow, is the method employed, and embraces Boyle's latest patent "air-pump" ventilator (upcast) and Boyle's latest patent downcast ventilator, which effects a continuous change of air between decks under all conditions of the weather, as, owing to these ventilators being perfectly waterproof, the system can be kept in operation at all times, even during the roughest weather, when the deck is swept by seas. The system is automatic, and having no mechanical movement of any kind it cannot get out of order and requires no attention—most important features in the ventilation of vessels.

There is no doubt that the "Boyle" system is a good one. It was awarded the 50*l.* prize with grand diploma—the only prize offered—at the International Ventilation Competition, London, presided over by Lord John Manners, and the highest award for ventilation at the last Paris Exhibition—two gold medals and one silver medal—when some of the best known systems in Europe and the United States competed.

It is employed in the British and foreign navies and by the principal steamship companies in this and other countries, from whom Messrs. Boyle have received many valuable reports, one being from a first naval lord of the Admiralty and another from Lord Kelvin, in connection with the application of the "air-pump" ventilator to his yacht *Lalla Rookh*.

As a significant indication of the serious attention that is now being paid by foreign Governments, as well as our own, to the proper ventilation of warships, we may mention that the Russian Government are extensively employing the "Boyle" system, sixteen battle-ships having up to the present been ventilated throughout with this system, whilst others are in progress.

The Indian troopship *Hardinge*, the largest troopship, we believe, in existence, designed by Sir Edward Reed for the British Government, and recently built by the Fairfield Shipbuilding Company, Glasgow, is fitted throughout with the "Boyle" natural system of ventilation, that system having been selected by the Admiralty as being the most suitable for the very trying conditions existing in such a vessel.

## THE BISLEY HOMES.

The following letter from "A Subscriber" has appeared in the *Times*:—

May I attempt to give an answer to the important questions raised by you in your leading article of the 16th inst., which I have only just seen?

I was a large subscriber to the building trades' gift to the nation. Owing to Lord Pirbright and the Soldiers and Sailors' Help Society my subscription has been absolutely wasted. I should have preferred to keep silent, but as Lord Pirbright and Lord Cheylesmore, better known to the building trade as General Eaton, with Sir Theodore Martin have again resumed their unseemly wrangling, and you have now brought your great influence to bear in favour of the truth being known, I

feel it is only just that as far as they relate to the building trades' gift to the nation the facts should be stated.

In 1900, on "the suggestion of Mr. Edwin O. Sachs, chairman of the British Fire Prevention Committee, in consultation with several leading builders and manufacturers, it was decided to ask the building trades of Great Britain to help in the matter of meeting the requirements of wounded soldiers returning from the Transvaal war." A strong committee was formed. The administrative work was to be in the hands of a small executive, comprising Mr. Sachs (the originator of the gift), Mr. Farrow, Mr. Hammond and Mr. Ellis Marsland, with Sir John Taylor (H.M. Office of Works), Mr. Thomas Blashill (late architect to the London County Council) and Mr. Arthur Cates (past vice-president of the Royal Institute of British Architects, late Crown surveyor) as advisers. The donors were also represented by, amongst others, the well-known contractors, Mr. J. Randall (Kirk & Randall), Mr. H. H. Bartlett (Perry & Co.), Mr. J. Howard Colls (Colls & Sons), Mr. George H. Trollope (George Trollope & Sons) and Mr. T. F. Rider (T. Rider & Sons), who was appointed hon. secretary.

A circular was issued. It stated:—"Lord Pirbright has generously given an extensive freehold site at Bisley," that "the Soldiers and Sailors' Help Society has undertaken the management and maintenance of the homes to be erected on this site under a scheme initiated by H.R.H. Princess Christian." The building trades were to erect six cottage homes, which homes were to be known as the building trades' gift to the nation. "The gift was primarily to take the form of contributions in kind," but those firms who could not see their way to contribute in kind were asked to do so in cash. Large contributions both in kind and in cash were promised. Messrs. Trollope & Sons agreed to carry out the work practically at cost price.

Everything went well until August 1900, when the controversy between Lord Pirbright and Sir Theodore Martin and the Soldiers and Sailors' Help Society began. In consequence the executive of the building trades' gift had to consider their position. I think I cannot do better than quote a resolution passed at a meeting of the executive on October 23, 1900:—

"The building trades' gift having proceeded with the erection of the homes at Bisley on the land presented by Lord Pirbright, on the understanding that they would be vested in the Duke of Connaught, Lord Derby and Lord Pirbright as trustees, and the committee having been recently informed

that the two former trustees have not at present accepted trust, and that, in consequence of the position take up by Soldiers and Sailors' Help Society, Lord Pirbright expressed his intention of withdrawing from the trustees, and that no rules and regulations have yet been framed, the committee regards the present state of circumstances as unsatisfactory, and is of opinion that the legal position, regards the land and the trusteeship, should at once be clearly defined, and that they should be officially informed by whom and under what conditions the homes, when completed, are to be managed; and further, that, under the circumstances, building operations generally should be suspended until the above points have been satisfactorily cleared up."

It seems incredible that the gentlemen whose names I have given, who, with others, undertook to be responsible to the building trades for the proper carrying out of their gift to the nation, should have proceeded to erect these homes before the land had been conveyed or the trust accepted. But so it was. The differences between Lord Pirbright and the Soldiers and Sailors' Help Society stopped the work nearly two years.

"Twelve months elapsed before a reconveyance of the land was completed," and then the Soldiers and Sailors' Help Society informed the executive of the building trades' gift to the nation "that the soldiers evinced so strong a disinclination to occupy so large a block of homes as those at Bisley that those already erected by them are still untenanted." The chairman of the Soldiers and Sailors' Help Society further informed the executive "that, if the homes in connection with the building trades' gift were completed, his committee would do their best to utilise them."

This, sir, is a brief statement of the facts. The building trade responded to the call made upon them; the men at many of the building jobs made collections, I suppose altogether contributions in kind and cash exceed 20,000£, and for the purpose. It is not likely the building trade will contrive another penny.

While admitting that those responsible for the building trades' gift should never have started until they were certain of their position as to the conveyance of the land, the trusteeship and the maintenance of the homes when finished, it is very owing to the miserable and petty squabbling of Lord Pirbright and the Soldiers and Sailors' Help Society that those who have fought so well and suffered so much in the Transvaal have been deprived of what was honestly meant by the building trades to be a comfort and a benefit to them.

# The Architect.

## THE WEEK.

THE resolution which is to be submitted to the trustees of the Manchester Infirmary after the holidays is as follows:—"That the board of management of the Royal Infirmary be empowered to negotiate once more the sale of the entire Piccadilly site and buildings thereon to the Manchester Corporation for the sum of not less than 400,000*l.*; and, in the event of the City Council again refusing to purchase, that the Board be authorised to offer the site, with the sanction of the Charity Commissioners and subject to Act of Parliament, for sale publicly to the highest bidder, with a view of applying the proceeds, if and when sold, to the erection of a new infirmary of adequate accommodation and equipment on a suitable site elsewhere." At present there is no public announcement of the course which will be adopted by the Manchester Corporation. It is needless to say there are several suggestions about the utilisation of the site for the benefit of Manchester. No more commanding position is to be found in the city, and if the removal were practicable, Mr. WATERHOUSE'S town hall would be the most suitable building to be placed there.

UNITY is never more desirable than in connection with a series of wall-paintings. Without that principle the different works fail to give mutual aid and to co-operate in producing a definite result. They become to some extent like annual exhibitions. That, we fear, is destined to be the fate of the pictures in the Panthéon. When it was decided to adorn the walls with paintings by modern French artists, the history of Christianity in France was to be made manifest. The building being then used as a church, and dedicated to St. GENEVIÈVE, the late PUVIS DE CHAVANNES and M. JEAN-PAUL LAURENS depicted scenes in the life of the patroness of Paris. Panels were also assigned to St. DENIS, St. LOUIS, CHARLEMAGNE, JOAN OF ARC, &c. But since the church has been secularised there is a desire to avoid ecclesiastical subjects. M. EDOUARD DETAILLE has received a commission to paint incidents in the three days' Revolution of July 1830, and they are to be placed in the apse above the mosaic by HÉBERT, which shows CHRIST telling His disciples to love one another. The late JULES DALOU before his death had completed the model for a group representative of the orators of the Revolution, and M. ANTOINE MERCIÉ is engaged on a similar work which will recall the generals. There is no guarantee that some of the existing canvases may not be superseded by other scenes from the Revolutions. To secure consistence a course of that kind cannot be avoided. M. DETAILLE has also finished two grand pictures which are to appear on the walls of a *salle* in the Hôtel de Ville. The subjects are the *Enrolment of Volunteers in 1789*, and the *Return from Jena*, the latter suggesting that the Municipal Council, at least, are not afraid of Germany. The painter is also busy on a painting for the ceiling, and some for other panels in the *salle*.

In the reports of the examiners on building construction, it is evident that the students in the schools of the Board of Education, although they may produce showy drawings, are not well grounded in the elements of construction. The teacher is for the future advised to explain common building materials, the sizes of bricks, why there is more uniformity in their sizes than in slates, why water condenses on the inner surfaces of glass, windows, walls, &c. It would seem incredible that almost all the candidates for honours were unable to tell the weight of a piece of iron of given dimensions. To say that a piece of iron an inch square and a foot long weighed 500 lbs., or 4 or 5 lbs., is proof that there is no realism or practical character in much of the teaching. The notes of lectures were often nonsense. Lord GRIMTHORPE once remarked that an architect was an artist in respect of his drawings. We wonder what he would say if the following paragraph of the examiners on drawings which were submitted in honours classes came before his lordship's eyes:—"In regard to drawing we do not see the same accuracy, as a rule, in building drawings that we find in machine drawings.

Every builder, as an architect, is an artist, and practises a fine art. However this may be, his plans, elevations and sections are no more necessarily fine art than are the drawings of a mechanical engineer. Why will students of this class throw careless washes of colour over dirty, careless pencil drawings? Do they think they have anything in common with rapid water-colour sketches for art purposes?" A few examples of genuine architectural drawings would evidently be of great utility in the schools, and should be purchased by the authorities like other examples of work.

GROUND in the neighbourhood of the sea or tidal rivers has often sources of danger when used as building sites, which are not apparent however carefully the soil may be examined. It is only when the walls of buildings are being carried up and the weight is increased on the stratum that the inadequacy of supporting power is realised. In such circumstances amateur builders who have grown wise after the event find opportunities to display their skill. A case of this kind has just occurred at Brighton. A generating station for the lighting of the town is in course of construction at Fishersgate. The foundation walls were nearly completed when it was ascertained that the southern one showed signs of weakness. It was therefore decided that the site should be slightly changed, the northern wall taking the place of the southern. There is nothing remarkable in the mishap, but as the work was executed for the Corporation it is needless to say that the usual amount of criticism is heard, and the failure of the soil is ascribed to other causes than the want of cohesion among the materials beneath the surface. The sea at Brighton was not always under such control as it appears at present, and evidently the waves were allowed to follow their own sweet will at Fishersgate, for the ground in a geological sense is not of ancient date, and has not been consolidated by ages. The Brighton Town Council cannot expect to be guaranteed against contingencies any more than a private building owner, and their duty now is to make the best of the conditions, and to be thankful that the failure was not of a more costly character.

THE remarks on school buildings in the recent reports of the inspectors of the Board of Education suggest that all that is desirable by teachers and students is not always provided. Mr. CARTLIDGE, the chief inspector of art instruction, states that even in some of the best new schools lighting is not sufficiently considered. The broad mullions and transoms cause confusion of lighting, which is an obstacle to the progress of the students. The storage accommodation is insufficient, and he says "in the matter of ventilation it would seem that most architects are unable to make satisfactory arrangements in school of art buildings." He refers to one case of a modelling-room in which the clay and work bin, arranged internally so as to keep the clay and models in a damp state, was carefully surrounded by hot-water pipes. Mr. ALLPORT is of opinion that in technical schools enough attention is not bestowed on the planning and selection of a site to allow of adequate lighting of the art section. In one school out of five art-rooms only one has a north light. These are serious shortcomings, and it seems unjust to blame masters and students for defective work when the students have to encounter such unfavourable conditions.

In this country assistance is given by the officers of the Geological Survey on questions relating to water-supply. The inquiries which are necessary for the preparation of memoirs and plans enable them to be cognisant of phenomena which would be unobserved by an engineer whose examination was limited by time and circumscribed in area. In the United States they have gone a step further. A section of hydrography has been introduced in connection with the Survey, which is under the charge of a doctor of medicine. The object of it is to obtain trustworthy information about the character of the water in all parts of the country, not only in rivers, but when derived from underground sources. The aid of willing assistants has been secured, and a uniform method of investigating will be adopted. Information will then be available which will diminish the costliness of preliminary reports on water-supply, besides imparting more certitude to the data.

PAINTERS' ARCHITECTURE: DOMENICHINO.

## TWO SCOTTISH MASONS.

THE people of Cromarty have done well by celebrating the birth of their townsman, HUGH MILLER. Friends and admirers have assured themselves of his immortality, but renown is as fleeting as most other things on earth. HUGH MILLER's claims to it are based on his geological studies and on his controversial writings. His power of expressing his visions of the former state of the earth was so marvellous, it is difficult for a matter-of-fact geologist to resist the conclusion that MILLER was inspired by imagination rather than by close observation. He helped to popularise geology, but it would be puzzling to find a geological treatise or a paper in which his authority is quoted. Sir ARCHIBALD GEIKIE, who has much in common with HUGH MILLER, said with truth that "he clothed the dry bones of science with living flesh and blood. He made the aspects of past ages to stand out once more as his vivid imagination conceived that they must once have been. He awakened an enthusiasm for geological questions such as had never before existed; and this wave of popular appreciation which he set in motion had never since ceased to pulsate throughout the English-speaking population of the world." The ex-director of the Geological Survey of Great Britain also acknowledged that "it was MILLER's 'Old Red Sandstone' that first revealed to him the ancient history that might be concealed in the hills around him and the meanings that might be hidden in the commonest stones beneath his feet. He had been interested in such objects, as boys are apt to be who spend much of their time in the open country, but it was that book which set him on the path of intelligent inquiry." HUXLEY, too, testified to the patience and sagacity of MILLER in his researches, and to the natural insight which seemed to have supplied the place of anatomical knowledge. But the modern geologist requires more or less acquaintance with anatomy, and field-work is now served by processes which were unknown to HUGH MILLER. As regards his writings on Church policy, a great many people in Scotland would at the present day be unable to give an account of the controversy on one side of which HUGH MILLER was a champion fifty years ago. Indeed, for some time before his death he was, we believe, regarded with suspicion by members of his own party. It is therefore doubtful whether as a man of science or a man of letters he will retain a hold on posterity. But the story of his life and its tragic ending should hereafter insure to him the sympathy of men.

We must not forget that HUGH MILLER was a quarryman and a mason. On that account he has a claim on our recognition. Indeed, we think his example may tend to enforce a lesson which is much needed. There is no doubt he was a genuine Scotsman, but Cromarty, where he was born in 1802, possessed many families from the Lowlands, and some of whom no doubt originally came from England. Popular belief is, however, in favour of the theory that he was of Viking descent, which view is thought to be upheld by the fact that his father and several of his

relatives were sailors. HUGH MILLER was early an orphan and claimed the right to be lord of himself and dispose of his life as he wished. Accordingly he bound himself as an apprentice to a stone-mason; he began by working in a quarry. In that way he first came in contact with the Old Red Sandstone of which afterwards he gave such glowing descriptions.

In his "Schools and Schoolmasters" and "First Impressions of England" there are passages which prove that he was contented with his trade, or perhaps it would be more correct to say that he courageously resolved to make the best of the situation, like MARK TAPLEY when he was an architect's partner in the flourishing city of Eden. He studied hard during the enforced idleness of the winter months, and remembering, we suppose, the example of ALLAN CUNNINGHAM, he tried his hand at poetry. But there was a largeness about MILLER's imagination which would not bear to be restricted by metres, and the most ardent of his admirers would not easily remember his compositions in verse.

After a time he obtained an appointment in a bank, and abandoned stone-working. He continued to write. He showed such ardour in Church affairs that when it was proposed to establish a journal to advocate the views of men of similar opinions he was selected as editor. HUGH MILLER thought, no doubt, that he had a mission, and his articles in *The Witness* suggested that the fierce covenanting spirit was not extinct. He wielded words like a claymore. Every article of his signified a loss of nerve force, and before many years were over his brain, which was that of an intellectual giant, was beyond the controlling power of his will. He varied controversy with essays on geology. Science, if rightly followed, might have served as a regulative power, but his manner of treating the phenomena of geology imposed a strain on him almost as severe as the contentions of Church parties. He must have known also that he was touching perplexing subjects. It was the general belief in Scotland that Genesis and geology were opposed, but one service rendered by HUGH MILLER was, by his genial ardour and irresistible eloquence, sweeping away, as Sir ARCHIBALD GEIKIE said, "the last remnants of the barrier of orthodox prejudice against geology in this country. The present generation can hardly realise the former strength of that bigotry, or appreciate the merit of the service rendered in the breaking of it down." When at length, after correcting the proofs of his last volume, "The Testimony of the Rocks," he raised his strong hand against himself, even his opponents had to acknowledge that he was a brave and just man who had sacrificed himself in the service of science and religion.

In 1785 ALLAN CUNNINGHAM was born in Dumfriesshire. At the age of eleven he also was apprenticed to a stone-mason. He endured similar vicissitudes to HUGH MILLER, but he had gained a local reputation as a rhymester at a much earlier period than the Cromarty youth. The fame of BURNS was accepted by everyone in Dumfriesshire, and as the poet lived until 1796 the bright young CUNNINGHAM

was one of his votaries, and he has given a description of the poet's appearance which probably comes nearest to truth. He brought out an edition of BURNS's works in 1834.

CUNNINGHAM grew tired of masonry, and before he was thirty he was known in London as an industrious writer in prose and verse. WALTER SCOTT was deceived by some of his ballads, which he concluded were ancient examples worthy of a place in any Border Minstrelsy. As in the case of MILLER, literature was followed with persistence, suggesting that thoughts could arise and be expressed with the regularity with which stones were dressed. But composition carried on under such circumstances is exhausting. MILLER died when he was fifty-four, and CUNNINGHAM, whose life was amidst happier surroundings, died when he was fifty-seven. He found congenial occupation as the major-domo, the confidential manager of Sir FRANCIS CHANTREY's workshops for the production of sculpture. His admirers were of all ranks, and it was real gratification to Sir WALTER SCOTT when he was in London to visit "Honest ALLAN." His writings are of many classes; but, unlike MILLER, CUNNINGHAM wrote several romances, a drama, biographies, as well as six volumes of lives of the most eminent British painters, sculptors and architects. He contributed successfully to the enjoyment of his contemporaries, and if all his writings do not survive, some of his songs will, we hope, be remembered as long as the men and women of Scotland have voices.

Whether the two masons missed their true vocation it is now impossible to determine. They were both men endowed most liberally with imagination. MILLER's sometimes seemed to be almost as sublime as MILTON's. They were not the only clever men in Scotland or in England who were to be found toiling as masons. But as the trade was then administered, and to some extent it is unchanged, they were out of place in a stoneyard. It would be an error to undervalue the simplest masonry, and there are problems in stone-cutting which require no small amount of intellect. But such work as falls to an ordinary journeyman in the farmhouses and houses in the small towns of Scotland never calls for extraordinary skill, and it is easy to conceive a great part of it being executed by means of a machine.

For men who are gifted with the powers of CUNNINGHAM and MILLER it would not be presumption if they attempted ornamental work, but the organisation of industry in this country is an obstacle to any effort of that kind. ALLAN CUNNINGHAM tells us that when he came to London sculpture was to him an unknown art, and he describes his feelings when he first saw CIBBER's *Madness* and *Melancholy* outside the asylum for insane in Moorfields. That, no doubt, was owing to the condition of Scotland, for no examples of the sculptor's art were visible on the roads of Dumfriesshire. But ALLAN wished to have sculpture of another kind besides formal statues. "Sculpture was," he wrote, "to Gothic architecture what the blossom is to the leaf. It was subordinate indeed to the masonry—or rather the conception of the whole was so much the effort of one mind, that the sculpture seemed tame when removed from the consecrated recesses, and the architecture without it appeared deprived of its chief grace." Why should not similar blossoming be allowed in modern architecture? CUNNINGHAM would have been able under favourable auspices to have executed such architectural sculpture as would enhance the masonry. But to use his own words, "It is singular how few have had the fortune to be put at the outset of life into the path wherein their genius lay."

We can hardly suppose that the Mediæval masons were always satisfied with building walls or even forming vaults. It is more likely that when an opportunity offered, which was frequently, they were capable of making the stones assume the forms of leaves or flowers. Only slaves should pursue monotonous operations year after year. If special sculptors had to be employed in the old churches and cathedrals the expenses might often be deterring, and there would be delays which were never likely to be overcome. In our time a CUNNINGHAM or a MILLER who desired to become something more than a layer of stones in courses would, if possessed of strong will, be able to acquire

the rudiments of sculpture and modelling in art schools without any large deduction from their wages. But their fellow workmen would rise in rebellion against them. Liberty of action is not allowed to reach such an extreme. The consequence is that clever masons are compelled to take up exhausting varieties of work, while building loses the services of men who could have conferred grace upon it and in that way increased its value. A Scottish proverb says, "Strive for a silk gown and you may have a sleeve of it." In the building trades men with ambition to prove their worth should not be manacled by the idle and lethargic.

#### CHARLESTON AND GEORGETOWN, U.S.A.\*

CHARLES II. was liberal in portioning out vast areas of North America among his friends. Every reader of romances remembers how Colonel HENRY ESMOND's family had in that way obtained an estate in Virginia, and it was on the beautiful banks of the Potomac that a new Castlewood was erected, which soon became the property of the WARRINGTONS. That grant may not be recorded in what are called histories, but in them we find it stated that about 1662 EDWARD HYDE, who was more familiarly known as Lord CLARENDON, and seven others were accorded possession of all the territory situated between 31° and 36° 30' north latitude, which was called Carolina. The proprietors formed for over half a century the only government. JOHN LOCKE, the philosopher, was secretary to them, and the manuscript still exists of the scheme of government for the colony which he drew up, and which was remarkable for its spirit of toleration. Nobody was to be disturbed, molested or persecuted for his religious opinions or way of worship. Nobody was to be a freeman or possess an estate or dwelling who was not, at least, a deist, but "any seven or more pastors agreeing in any religion shall constitute a church, to which they shall give some name to distinguish it from the others." So much freedom was not suited to that bigoted age. In 1719 the country was divided into North and South Carolina, and a royal government was established. Charleston was founded in 1680, and it remained the capital of the province until it was superseded by Columbia in 1787.

It is well to bear the dates in mind when we have to consider the architecture of the Charleston district. The houses recall not only England, but the age of SHAFTESBURY, CLARENDON and LOCKE, when the influence of INIGO JONES still prevailed. The English emigrants must have brought with them a love for refined architecture and esteem for English work at the end of the seventeenth and the beginning of the eighteenth century. But there was another influence which was derived from a nearer source, and that was the climatic conditions which made the verandah a necessity. Says Mr. C. R. S. HORTON:—

The Charleston we know to-day presents, architecturally, a quaint mixture of French and English ideas, together with some of the more salient ones of old San Domingo, in the way of exaggerated verandahs and high brick walls thrown in for good measure. The first two of these *motifs*—the French and the English—were inherited, naturally enough, from its earliest inhabitants, the English Cavalier and the French Huguenot, both of whom represented people of pronounced opinions as to what constituted domestic comfort and elegance. The San Domingo feeling came naturally and regularly enough, too, along with a lot of wealthy immigrants from the West Indian Islands who made their homes in Charleston, where the climate was not totally unlike that left behind them, and proceeded to make themselves comfortable in their own way. The houses built by these immigrants were usually spacious, with enormous two and three-storey covered verandahs as special features, though quite lacking in interior adornment. They were commonly surrounded by large grounds, around which high brick walls were built, after the manner of that surrounding the Simonton residence on Légare Street, which, with its great iron gateway, is one of the show-places of the city. These walls afforded the greatest privacy—a thing always of paramount importance with Charlestonians—and allowed the outsider no glimpse of the well-arranged garden within, with its gay masses of odorous opopanax, *rêve d'or*

\* *The Georgian Period*, being Measured Drawings of Colonial Work. Illustrations by E. Eldon Deane, E. P. Morrill and C. M. Bill. Part X. (Boston: American Architect and Building News Company. London: B. T. Batsford.)

roses and tropical palmetto bushes, among which the women of the family wandered informally at pleasure—or, if any, just a tantalising peep through the richly wrought entrance gates.

The verandah in Charleston exemplifies what EMERSON calls the poetry of columns. No objection can be made in those cases to superposing. Sometimes, as in the Nathaniel Heyward House, the Witte House and the Ancrum House, there is only one storey, and the verandah might be taken to be the façade of a chapel or public building in Italian style to which large timber additions had been made. A building which otherwise would be considered plain thus assumes importance. In the De Saussure House there are three ranges, and between the columns is balustrading. Generally unadorned Tuscan columns are used, but in the Horry House an Ionic order is also introduced above, and the spaces between the columns are halfway filled with latticework, which allows of privacy to the occupants. In Concord, near Natchez, which dated from 1789, only a single order was required for the two floors. The building was destroyed by fire a few years ago, but the view of it serves to explain how the builders became accustomed to elongated columns, and employed them for flanking doorways as well as in the interiors.

The exteriors have generally large gateways, which often show an ingenious combination of wood and iron, as in the Edmondson Gates. The wrought-iron work often brings to mind old houses in the suburbs of London, and it was usually imported from England, the initials of the owner of the buildings being introduced instead of the customary "G. R." As a rule the details are Italian, freely translated, but occasionally we meet with strange incongruities, such as a window in the form of a pointed arch, as in the pediment of Witte House, which suggest alterations by incompetent builders and ignorant owners. An oval window in a pediment is common.

The interiors occasionally exemplify more regard for design than the outsides. One of the houses, Friendfield, Georgetown, has the walls covered above the dado with one of those French papers which were used as substitutes for tapestry. Evidently it was intended to represent a view on the Seine. But truth was altogether neglected, for buildings were utilised which were found in other parts of Paris. The Porte St. Denis is assumed to be on the bank as well as the Panthéon. The towers of Notre-Dame are in the background, the Arc du Carrousel is also made to appear as a riparian structure. It was erected in 1806 and the wall-paper cannot be of older date. Various other familiar objects outside Paris are combined. On the left bank of the river pastoral and agricultural operations appear to be carried on, while some people are bathing. The paper was sold in small pieces, and the buildings of Paris, therefore, could be arranged and combined at the discretion of the hanger. It is an interesting relic of an old-fashioned wall-decoration, and is suggestive of the "pretty slight drollery, or the story of the Prodigal, or the German hunting in water-work" which FALSTAFF said was worth a thousand fly-bitten tapestries. All the mansions shown are indicative of opulence. Charleston was admirably selected for the purposes of trade. It was an excellent seaport and the country was fertile, especially for crops of tobacco and cotton. But labour in the fields in so warm a climate was not adapted to English physique. In Carolina slaves were a necessity prior to the invention of agricultural machinery. The Brewton slave quarters, which look like a transformed chapel, are reminiscent of the old condition of things when Africans were chattels. General WADE HAMPTON, of Carolina, is said to have owned no less than 3,000 slaves. With their aid wealth was not difficult to attain, and no doubt much of it was expended in erecting and adorning residences. JOSIAH QUINCY, in his account of the condition of Charleston in 1773, wrote:—"I can only say in general that in grandeur, splendour of buildings, decorations, equipages, numbers, commerce, shipping, and, indeed, almost everything, it far surpasses all I ever saw or ever expect to see in America." Emancipation and other causes have overcome the "royal merchants" and planters of South Carolina. Mr. ELTON DEANE, the architect, whose illustrations are the chief feature in the last part of "Colonial Architecture," lately visited Charleston. He has described its appearance in

detail, and of course enjoyed the evidence of imitation of English work in the houses. He sums up his observations as follows:—

I found it a proud old city, with every evidence of wealth and luxury in its past, but there is scarcely an estate upon which the inscription "Ichabod" could not be appropriately placed on its gate-posts. Without help, the spacious gardens are but poorly kept up, and reflect the all-pervading decay. As you behold all these big mansions, and after talking with their owners, you are manifestly impressed with the distinction of having a grandfather who helped to make history, but reflect that this they did because they could not very well help doing so, and while these good people have been dreaming of their family trees, the Northerners have been studiously pushing a way for their sons and daughters.

One of the American writers says that the Southern houses are "more lovable than any type of house we have," and in that opinion Englishmen, after studying the plates, are sure to agree. The wealthy planters must have had broad notions and confidence in the efforts of their architects to provide homes that would be at once comfortable and dignified. Like the other numbers of "Colonial Architecture" brought out by the *American Architect*, English influences are perceptible in the majority of the old buildings belonging to Charleston. The plates form therefore a supplement to the history of English architecture which has exceeding interest. In the British colonies there are now many places where the climate is as sunny for the greater part of the year as that of South Carolina. In such happy places the conditions which have to be met are similar to those which were realised in the Southern States. For modern architects the views of the American houses would have utility in suggesting solutions which were arrived at by skilful predecessors working amidst favourable circumstances.

#### CAMBRIAN ARCHÆOLOGICAL ASSOCIATION.

THE members of the Cambrian Archæological Association assembled at Brecon on August 18 for their annual meeting. The Association had twice before met at Brecon, in 1853 and in 1872. Sir Joseph Bailey, who was president at the last Brecon meeting, again took the chair this time, under his new title of Lord Glanusk. Whilst thirty years, says the *Manchester Guardian*, have made hardly any appreciable difference in the ancient monuments of the district, it is sad to think of the havoc that time has worked among the veteran archæologists who used to attend the meetings of the Association. Such men as Professor E. A. Freeman, Professor J. O. Westwood, J. H. Parker of Oxford, M. H. Bloxam, of Rugby, C. T. Clark, of Dowlais, and the Rev. E. L. Barnwell are no longer with us, and the present generation of Welsh antiquaries seem to be quite satisfied to quote from their writings. To those who have listened in awe-struck silence to Freeman's scathing denunciations of Parker because he had dated a particular architectural moulding 1187 instead of 1190, and to Parker's quietly sarcastic remarks in reply, a great change seems to have come over the Association in the past thirty years.

The whole of the district included in the four days' excursions, from Tuesday to Friday, is on the old red sandstone formation, and consequently the scenery is more uniform in character than in localities where several different kinds of rock crop up in succession close together, as is the case near Merthyr and other places on the edge of the Glamorganshire coalfield. Not only is Brecon itself on the old red sandstone, but the beacons, or vans, which form the most prominent features in all the surrounding views are also of the same formation. The highest peak—Pen-y-Fan, 2,910 feet above sea level, and 5 miles south of Brecon—is the loftiest old red sandstone summit in the kingdom. The Carmarthenshire Van, close to the boundary of that county and 15 miles south-west of Brecon, is a landmark of nearly equal importance, although about 300 feet less in altitude than Pen-y-Fan. On the Ordnance Map it will be noticed that the words "cefn" and "cwm" recur at intervals along the mountain chain to the south of Brecon, indicating a series of long rounded ridges covered with grass, alternating with deep valleys. The skyline of the Beacons is not unpleasing, though the forms of the peaks may appear somewhat fantastic to an eye accustomed to the more usual mountain tops of rugged slate or granite, or the peculiarly beautiful curves which show the results of glacial action. The special charm of the landscapes in the neighbourhood of Brecon lies in the gentle gradation from the fertility of the green meadows close at hand to the wildness of the mountains far away, whose barren places are toned down

to blue grey by the atmosphere so as to harmonise with the rest. During the excursions the members were delighted with an endless succession of panoramas, having as their main features the Usk in the foreground, with well-wooded hillsides along its banks, the rounded grassy uplands in the middle distance, and the purple masses of mountains beyond. The town of Brecon itself is not particularly attractive.

The prehistoric antiquities seen during the excursions were inferior both in quantity and quality to those in other parts of Wales where the meetings of the Association have been held. It is not altogether easy to explain this; certainly it would be unsafe to assume that all the important monuments have been destroyed. The prehistoric remains visited on the first day comprised only a menhir, or standing stone, near Battle, and an ancient British hill fort of the usual type, called the Crûg, lying two miles north-west of Brecon. On the second day the site of the crannog or lake-dwelling discovered on a small island near the shore of Llangorse Lake by the Rev. E. N. Dumbleton in 1869 was examined. It is interesting as being almost the only example in Wales of a kind of pile structure which is common in Ireland, Scotland and Switzerland. All that can now be seen is a row of piles sticking up above the surface of the water. On the same day, had time permitted, the party should have seen the remains of a chambered cairn on Manest farm, a mile south-west of Tall-y-Uyn Junction, known as Ty-Iltyd—that is to say, the House of Iltyd. The chamber has been denuded of the cairn which once covered it, exposing the large flat slabs of stone forming the sides and roof. The chamber was very possibly used as a hermit's cell at one time, and there are several small incised crosses, carved on the slabs either during the period of its occupation or by pious pilgrims to the spot after the cell had been deserted. Iltyd was a contemporary of St. David and St. Samson, and gives his name to Llantwit Fawr, in Glamorganshire. A large number of churches are dedicated to him in South Wales. A parallel case of the probable use of a neolithic burial chamber as a dwelling-place at a much later period is Wayland Smith's cave, in Berkshire, which is mentioned in a Saxon document of the eighth or ninth century.

The Roman station of Bannium, now called the Gaer, which was seen on the first day's excursion, is situated 3 miles west of Brecon, in a strong position formed by the junction of the river Yscir and the Usk. Extensive masses of masonry are still visible above the ground, and the plan of the fortification can easily be traced. From time to time Roman antiquities are found on the site, consisting chiefly of Samian ware, various other kinds of pottery, blue glass beads, coins, bricks and tiles. Some of the tiles are stamped "LEG II AVG." showing that the station was occupied by the Second Legion (Augusta), the headquarters of which was at Caerleon-on-Usk. Most of the relics found here were shown to the members on Friday, when they visited Ffrwdgrech, near Brecon, the residence of Mr. David Evans, the proprietor of the Gaer. If the site were to be systematically explored, it would doubtless yield a plentiful harvest of antiquities, and in laying bare the plan of the buildings and perhaps discovering inscribed objects, the excavators would certainly throw much light on the Roman occupation of Wales. At present, although most of the finds are preserved, no record seems to be kept of the exact spots where the antiquities were dug up. Near the Roman station of Bannium is a sepulchral monument, sculptured with the figures of a Roman soldier and his wife, known as the Maen-y-Morwynnion, or "maiden stone." It bears an inscription now nearly obliterated. There is another maiden stone near Benachie, Aberdeenshire, but this is an early Christian monument with interlaced ornament upon it. Then there is the Maiden Castle near Dorchester, and many other instances of the use of the word might be cited. Between the Gaer and Brecon there is an ancient paved trackway, which is called Roman, but may be of almost any age from the prehistoric period down to the time of Bernard Newmarch, the conqueror of Brecknockshire. Mr. F. Haverfield read a valuable paper on Bannium at the evening meeting on Tuesday. He said that, as far as outward appearances went, there had been no reconstruction of the walls, and that consequently the place had been occupied for a comparatively short period. To judge from the evidence of the coins found on the site, the period of occupation would be from about A.D. 70 to A.D. 120. After that time the country was no doubt subdued, and a strong garrison would be unnecessary. Mr. Haverfield strongly advocated the use of the spade as the speediest method of solving the various archaeological problems connected with the struggle between the stubborn Silures fighting for freedom amongst the fastnesses of the Brecknockshire hills against the might of Imperial Rome. At Penoyre House, the residence of Mr. R. D. Cleasby, near the Gaer, the party had an opportunity of examining one of the most beautifully cut Roman sepulchral inscriptions in Wales. Unfortunately the slab is broken in half, so that the ends of all the lines are missing, thus affording the assembled antiquaries an endless field for speculation. The stone was found a few years ago at Battle, near Penoyre, and also not far

from the Gaer. Other Roman inscriptions of inferior interest were seen during Thursday's excursion at Tretower and Scethrog.

The valley of the Usk between Devynock and the Grand Crickhowel contains an unrivalled series of inscribed and sculptured stones of the early Christian period, dating from about A.D. 500 to A.D. 100. In fact no district in Wales affords a better opportunity for the study of the development of monuments of this class. The series commences with the rude pillar stones, the inscriptions on which are simply debased copies of Roman epitaphs, differing from them in two respects—(1) that the letters are very ill-formed, and (2) the lines, instead of reading horizontally from left to right, read vertically upwards from bottom to top. It is true that there are about a dozen pillar stones in Great Britain with inscriptions cut horizontally, after the Roman fashion, but these are exceptions of very early date, as three of them have the Chi-Rho monogram and two contain the Roman formula "Vixit annos . . ." The Celtic fashion of making the debased Latin inscriptions read vertically upwards instead of horizontally probably arose from the fact that the ogham inscriptions must read vertically because they are cut on the angle of the stone; and as many of the monuments are both bi-literal and bi-lingual, it would never do to have the ogham inscription reading one way and the debased Latin inscription another. An example of a pillar stone with a debased Latin inscription entirely in capitals was seen on Friday's excursion at Devynock. The members had an opportunity of examining specimens of the bi-literal and bi-lingual inscriptions at Trallong on Tuesday and at Glanusk Park on Thursday. The most interesting feature of the Glanusk inscription is that it gives the rare ogham letter X as the equivalent for the Latin P. The inscribed stone at Llanfihangel Cwm-dû is a good instance of the transitional type in which several minuscule or small letters are mixed with the capitals. The inscription means, "Here lies Cattoc, son of Teyrnoc." Somewhere about the year A.D. 700 the capital letters ceased to be used and the inscriptions were afterwards entirely in minuscules. Oghams also became obsolete, and as there was no further reason for continuing to make the Latin inscription parallel with the ogham inscription, or vertical, the old Roman custom of cutting the letters in horizontal lines was reverted to. At the same time Celtic ornament and figure sculpture begins to make its appearance on the monuments. The best example near Brecon is the well-known cross slab of Briamail at Llandefaillogfach.

With the exception of Brecon Priory Church, which is too well known to need description here, the ecclesiastical architecture of the district is somewhat poor. Most of the churches have been either over-restored or rebuilt, so that very few old features now remain. Of the smaller village churches that at Llanfillo, with its finely-carved rood-screen and a doorway, having a highly-ornamented lintel, was distinctly the best worth seeing. Mediæval military architecture was represented by the round keeps of Brinllys and Tretower, which are of the thirteenth century, and are built on the same plan as those at Pembroke, Coningsborough in Yorkshire, and Coucy in France. At Tretower there is also a fortified mansion of the fourteenth century, built round a courtyard and having an interesting gateway and hall with a massive timber roof. Amongst the best of the papers read at the evening meeting was one by the Rev. S. Baring-Gould on his recent excavations at Clegyr Foia, the fortress of the pagan Irish chieftain who gave St. David such trouble when he first settled in Pembrokeshire.

## THE CAMPANILE, VENICE.

A CORRESPONDENT to the *American Architect*, Mr. C. Howard Walker, was a spectator of the fall of the campanile. He sends to that journal a sketch, which we have reproduced as having historic interest, and with it the following observations:—

From a distance I saw the angel slowly descend, swaying, but upright, and my daughter and her governess were on the Piazza not 200 feet away. They both say that spurts of lime-dust puffed from the tower about 20 feet up from the ground, and that then cracks appeared at the base in the curtain-walls between the buttresses, which opened upwards with great rapidity, and the base of the tower spread "like the roots of a tree." There was little or no shock. The angel descended in an upright position until the cloud of dust rose and covered it, and must have come down full 100 feet before toppling. When found it was directly under and within the main portal of St. Mark's.

The Italians say the tower "se sedesse"—i.e. sat down upon itself. If there had been settlement it would have leaned. My own impression is this:—The top of the tower has been continuously repaired with new material; the bottom less so. The Loggetta concealed the condition of the bottom wall behind it, and it was neglected. The series of windows just inside the corner in order to light the stairs was always a structural weak-

ness in this type of tower. There has been work going on in flashing the roof of the Loggetta, which, while it seemed very slight and harmless under usual conditions, under these special conditions began to show great weakness at this point. This was acknowledged two months ago. The continuous repairs, &c., had produced in the brickwork, certainly of the outside walls, a state to which I can give no better definition than that it was a state of unstable equilibrium.

Energetic, organised action was imperative, and was not taken, from a lack of appreciation of the facts. I very much doubt if any action could have averted the disaster after the crack, which started at the lowest window towards St. Mark's a week ago, had begun to snap from window to window all the way up, because shoring-up would merely have transferred the weak point farther and farther up the shaft and to the right and left on the outer wall. But the miraculous thing is that St. Mark's is absolutely untouched—not a piece of mosaic fallen. The Colonne della Banda and the corner columns of the foundation were insecure. Certainly there would have been damage to St. Mark's. The library has at its end, in the second storey, two columns, with arches and entablature, torn out. The gates of the Loggetta, the figure of Mercury, and two of the carved blocks with putte are practically uninjured. The rest are buried still. I sincerely hope that America will liberally contribute. There has been a good deal of talk in Paris that re-erection of the old Campanile would not express the present advanced state of architecture, and some say that the Piazza is more harmonious without it. Fortunately, to my mind, no attention is being paid to these remarks. Venice has lost the foil, the contrast to the delicacy of its art. It was a noble foil, and dominated the long lines of the palaces from every approach. That the form of this vanished monument should be perpetuated is no mistaken conception.

In a letter to the *Times* the President of the Royal Academy writes:—

The expressions in the public Press have shown that the sympathies of the civilised world are with the Venetians in the catastrophe which has befallen them in the loss of their beloved campanile; especially do artists feel it as a personal loss, so conspicuously was it the key to the endless pictures which the beautiful city presents from wherever it may be seen, and so associated was it in our minds with the romance of its exquisite surroundings. Its rebuilding, as you have justly said, is a necessity, if only for its place in the panorama, and has been voted by acclamation.

A correspondent, in a letter which appeared in your columns on July 20, expressed a hope that the grief and dismay which the vast company of English who have visited Venice feel at this great calamity might express itself in the practical form of a subscription towards the reconstruction which, it is understood, is definitely decided on; and an editorial postscript to the letter in question suggested that the Royal Academy

should take the lead in organising this expression of our national sympathy.

In the attempt which we are now making to realise your suggestion it is not to be supposed that the Royal Academy doubts either the ardent desire or the capacity of the Italians, whether by a national subscription or by a grant from the Government, to carry to completion the restoration of this unique feature of the dignity and beauty of their world-renowned city. It is rather that we wish to offer our tribute of respect and regard to the Venetians, who always welcome us so hospitably, and to feel that we have had the honour of taking our share in making good a loss which is so universally deplored; and we hope that the thousands of our countrymen who owe so many happy experiences to Venice may so follow our initiative that England may play a substantial part in reconstituting the splendid ensemble which is so familiar to us.

It is to be regretted that there seems to be a technical illegality in the way of the Royal Academy using any part of its funds for such a purpose. I was therefore bound to make my appeal to the members of our body individually, and it was enthusiastically taken up, and has been warmly responded to by almost everyone with whom I have been able to communicate. The difficulty of finding them at this time of year when they are widely scattered has, I fear, caused some delay in forwarding to you the result of my appeal as far as it goes, but I am now able to send you a first list of subscribers from among the Academicians.

We now invite the co-operation of the general public, and if the Venetians are willing to accept our aid in this matter, I have little doubt but that there will be a liberal response from all sides.

Our treasurer, Mr. T. G. Jackson, R.A., has kindly signified his willingness to receive and keep in hand all donations sent to him and to deliver them to the proper authority when the time comes, and intending subscribers are requested to address their communications to him, at the Royal Academy of Arts, Piccadilly.

The contributions received will be acknowledged from time to time in the public Press.

First list of donations from members of the Royal Academy towards rebuilding St. Mark's Campanile:—Sir L. Alma-Tadema, 10*l.*; Edwin Abbey, 5*l.*; G. F. Bodley, 5*l.*; Thomas Brock, 5*l.*; H. W. B. Davis, 5*l.*; Frank Dicksee, 5*l.*; Luke Fildes, 10*l.*; Andrew C. Gow, 5*l.*; Peter Graham, 5*l.*; J. C. Hook, 5*l.*; T. G. Jackson, 5*l.*; B. W. Leader, 5*l.*; George D. Leslie, 5*l.*; J. Seymour Lucas, 5*l.*; W. W. Oulless, 5*l.*; Sir Edward J. Poynter, 10*l.*; Val. C. Prinsep, 10*l.*; Sir W. B. Richmond (conditionally), 5*l.*; Briton Rivière, 5*l.*; James Sant, 5*l.*; J. S. Sargent, 10*l.*; Marcus Stone, 10*l.*; W. Hamo Thornycroft, 5*l.*; J. W. Waterhouse, 5*l.*; Henry Woods, 10*l.*

### THE PRICHARD JONES INSTITUTE, NEWBOROUGH.

THE foundation stone-laying ceremony took place on the 16th inst. of the Prichard Jones Institute, Newborough, Anglesey, a building designed by Mr. Rowland Lloyd Jones, architect, Carnarvon, according to the instructions of the donor, Mr. J. Prichard Jones, whose desire was to build and endow in his birthplace an institute which should fulfil the purpose of a library, village club, and meeting place, and also should provide accommodation in which the aged people of the parish might spend their closing days in comfortable quarters and with pleasant surroundings. The site is on the road from Newborough to Gaerwen, and the institute will front the Menai Straits. Comprising some 26,000 square yards, the site will have three cottages or almshouses on each side. The quadrangle in front will be laid out as a garden. The architecture of the institute is Elizabethan in style, the cottages being arranged to harmonise. From the ground floor to the first floor the institute is to be of grey Anglesey granite, with dressings of Ruabon stone, and the upper part is treated in half timber, with two gables divided by a clock-tower over the entrance hall, which will be of granite to the domed roof, and this, with the finial, will be of copper. On the ground floor, to the west of the vestibule, is the library, 45 feet by 30 feet, and on the right a smoking-room and a coffee-room. Over the library is an assembly-hall of similar dimensions, and over the coffee-room a reading-room. All the necessary offices, such as kitchens, cloak-rooms and committee-rooms are provided. The cost of

the building and its furnishings will be about 6,000*l.*, while another 13,000*l.* will be required for its endowment.

### PYRMONT BRIDGE, SYDNEY.

WE have already described the construction and arrangements for working the new Pyrmont Bridge, Sydney. We now give a view of the roadway and parapets. The latter, it will be seen, are of a massive character. The bridge is almost sufficient to indicate the progress of the city, which has little more than a century of existence. In 1787 a fleet of eleven ships with about 750 convicts were sent, under the command of Captain Phillip, to found a colony in what is now called New South Wales. The intention was to use the shores of Botany Bay, but the land which Sir Joseph Banks had described as a Paradise was ascertained by less enthusiastic judges to consist mainly of swamps and sand. Port Jackson was therefore selected, the name being that of a sailor who was the first to discover the bay. The early days of the colony presented many hardships and riots of the convicts were common, but in 1803 it had so far advanced, a newspaper was established in Sydney. By 1820 the population of Sydney increased to 7,000.

In Sydney roads and bridges are under the control of a commissioner who is under-secretary for public works. The State is divided into sixty-two road districts, each being in the charge of a resident engineer. It is calculated that there are about 40,300 bridges and culverts. The improved condition of the roads has had a perceptible influence on the value of land and aided industrial pursuits throughout the country.

## NOTES AND COMMENTS.

THE authorities of Homburg some years ago decided to erect a memorial of the Landgraves, but the project was abandoned, for the sum required, at least 2,000*l.*, was not available. The sculptor who prepared the preliminary model and was to have the commission was Professor FRITZ GERTH. He is now engaged on a memorial of the Emperor WILLIAM I. The KAISER lately visited his studio to ascertain the progress of the work, and while there saw the sketch model of the Landgraves. HIS MAJESTY on hearing the story said the work must be carried out at his expense. The position for the monument has been arranged. The memorial will present portraits of eleven Landgraves who presided in Homburg between 1622-1866, besides portraits of Prince LEOPOLD, who was killed at the battle of Grossgorschen in 1813, and FREDERICK II., who was the restorer of the castle. The word "grave," which means grey or aged, was in early times a designation of judges, of whom there were many kinds. The Palgrave was a court judge who considered whether it was necessary for a case to be brought before the king. The Margrave was like our Lord of the Marshes and had care of the boundaries of the state, while the Landgraves settled ordinary lawsuits. In a great many parts of Germany the title of Landgrave was no more than an honorary distinction; but in Hesse Cassel and Hesse Darmstadt it was borne by members of the reigning families. The memorial in Homburg may therefore be regarded as a royal one, and on that account the Emperor has become responsible for its production.

THE report of Mr. F. PULLINGER on Science and Art classes has one paragraph which shows that under the modern arrangements of the Board of Education some of the teachers must now find less difficulty in making ends meet than formerly. He says:—"The system of paying Science and Art teachers by results has some interesting survivals in Yorkshire. I have come across cases in which teachers are paid at the rate of 18*s.* an hour. One teacher receives an income of well over 400*l.* for teaching five nights a week for about thirty weeks in the year. Another gets about 210*l.* for three nights a week throughout the same period. There is a case on record in which 4 guineas a night has been paid. Coaching at Oxford and Cambridge from first-rate men can be had at a cost of about 10*s.* an hour or even less. One can only hope that the teachers of evening classes in Yorkshire are men of superlative excellence. The matter is of considerable importance, as the payment of unnecessarily high salaries reacts upon the scales of payment which have been arranged for teachers of inferior qualifications. The chairman of a large school board has informed me that he has been compelled to pay much higher salaries since town and county councils have commenced their educational work." Nobody would grumble if the instruction were in all cases satisfactory, but when one of the examiners states that in the evening classes many pupils are to be found learning the rates of postage for letters, the cost of telegrams, and even the use of a Bradshaw's Railway Guide, when they could be so much more profitably employed, it is evident that science, art, and technology have assumed strange forms under the highly paid teachers.

THE Caerwent Exploration Fund is likely to receive an impetus in the right direction by the discovery on Friday last of the enormous number of 7,500 bronze coins. They are not all of extreme numismatic value, but they testify that in Venta Silurum there were people who tried to amass wealth. The hoard was unearthed in one corner of a room of a house which is being uncovered in the south-west portion of the city. The coins were all found loose, but they had probably been placed in a wooden bucket, one of the iron hoops of which was discovered with them. They all, as far as a cursory examination shows, belong to the fourth century A.D., and are of the smallest size current at that period, the total weight being only about 21 lb., which gives an average of about 20 grains per coin. All of them had apparently been in circulation.

## ILLUSTRATIONS.

LLOYD'S BUILDING, FENCHURCH STREET, E.C.: THE LIBRARY.

HOUSES IN PARK STREET, GROSVENOR SQUARE, W.

THESE six houses and the corner public-house, known as the Hertford Arms, have recently been erected in Park Street, W. Each house contains a kitchen, butler's pantry, and the usual offices in the basement; on the ground floor there is a morning-room and dining-room with the main staircase centrally situated, and back stairs in connection with same. On the first floor there is a drawing-room in front and a boudoir at the back, and on the remaining floors there are altogether eight bed-rooms, bath-room, &c. The stone dressings were executed in Portland (Whitbed) stone, and the red brick facings were obtained from Messrs. T. LAWRENCE & SONS, of Bracknell. The roofs were covered with the best Broseley tiles. The builders were Messrs. W. CUBITT, of 258 Gray's Inn Road, W.C.

DESIGN SUBMITTED FOR REBUILDING OF WESLEYAN CENTENARY HALL, BISHOPSGATE STREET, E.C.

THIS formed the subject of a limited competition for the new Wesleyan Centenary Hall in Bishopsgate Street, and the instructions to architects contained the following ideas of the trustees:—"The trustees do not wish to bind the competing architects to any particular scheme for the new building; but the arrangement they at present have in their mind is to arrange the ground floor and basement for letting to a bank, insurance company, or other large corporation, with a separate and exclusive entrance. To allot the first and second floors to the church departments, and the remaining available space for rooms suitable for letting as offices, with rooms for caretaker at the top. To approach the church premises and the offices over by a staircase and lift at the opposite end of the façade to the bank entrance, this portion to have a secondary staircase. The entrance to the church department, and the elevation generally, to be sufficiently monumental in character to comply with the trust-deed already referred to. The front elevation to be designed as one building, and the materials to be Portland stone and granite." The instructions then set forth the detailed accommodation required. It will be seen that an endeavour was made to express outwardly the various portions of the building, namely, the great banking hall on the ground floor, the large committee-room on the first floor, extending the whole width of the façade, and the three floors of offices over. The design illustrated was submitted by Messrs. BANISTER FLETCHER & SONS. It was one of the two designs premiated by Mr. ASTON WEBB, A.R.A., the assessor, and was exhibited in the Academy of 1902.

CHURCH OF ST. GERVAIS AND PROTAIS, GISORS.

THE town of Gisors, in the Department of Eure, is not often visited by English tourists. It is, however, connected with English history. HENRY II. erected the donjon in the twelfth century, and it was in Gisors that the French and English kings resolved to join the Crusaders. Besides the castle there is another Mediaeval work, the church which was dedicated to St. Gervais and Protas. It now represents the styles of the thirteenth, fourteenth, fifteenth and sixteenth centuries. The view which we give suggests that the builders in the later period endeavoured to show that Renaissance details were not out of keeping in a Gothic building. It is needless to say that the two styles cannot be successfully combined, and at Gisors there is variety rather than unity. The great doorway has, however, picturesqueness, but in the northern doorway Renaissance alone has been used. In the interior there is much beautiful carving. The Tree of Jesse is about 50 feet high. One of those fleshless figures which are often found in foreign churches is attributed to JEAN GOUJON. A series of medallions painted in the sixteenth century deal with the legends of the patron saints. The church deserves more attention than it has received. It is one of the buildings controlled by the Commission of Historic Monuments.

## SOME OXFORD COLLEGES.\*

*University College.*

UNIVERSITY College was founded by William of Durham in 1249, who bequeathed to the university 310 marks in part for purchasing annual rents to maintain a certain number of masters for the study of theology in Oxford, and who were to be natives of Durham or that district. The first house purchased was Little University Hall, in Schools Street, where probably the masters were located. Shortly after Drowda Hall, opposite the present college, in High Street, was acquired; another hall in Schools Street in 1262, and two to the east of the college in 1270. In the reign of Edward II. the masters purchased, or had given them, other houses, some of which now form the site of the college. The management appears to have been regulated by the university in congregation until 1280, when the masters received, under the name of "The Hall of the University," their first statutes and power of self-government.

The college commands a very imposing position in the High Street. The principal entrance has richly-roined vaulting, over the gateway being a statue of Queen Anne, and on the inside one of James II., put up in 1687. The west side of the first quadrangle, which is 100 feet square, was built in 1634, the north side fronting High Street in 1635, and the hall and chapel on the south a little later, the buildings on the east not being erected until 1665. The inner quadrangle was completed in 1719 and contained the master's lodgings and fellows' rooms. They were built from a bequest by Dr. John Radcliffe (physician to William and Mary and founder of the Radcliffe Library), Queen Mary's statue being over the entrance gateway in High Street and that of Dr. Radcliffe facing the quadrangle.

The building of the chapel was commenced early in the seventeenth century, but remained unfinished during the Civil Wars. It was consecrated by Walter Blandford, Bishop of Exeter, on March 25, 1665. The marble pavement was laid in 1692, and the panelling and exquisitely carved screen, in the style of Grinling Gibbons, by Barker, were put up in 1694. The chapel was restored and remodelled by Sir G. G. Scott, R.A., in 1862, when the beautiful panelling at the east end was removed to the bursary. The windows on the north and south sides are by Van Linge the younger, and were put up in 1641. There is other glass painted by Henry Giles, of York, in 1687, and presented by Dr. Radcliffe, and the east window presented by Dr. Plumtre (master) in 1864.

The hall was finished about 1657. It was refitted in 1766, when the present wainscoting bearing the arms of the contributors to the work was added. At the same time the existing coffered ceiling with fan tracery was put up, concealing a fine open-timbered roof with louvre, and Sir Roger Newdigate gave the fireplace, the design of which is taken from a monument in E. Cathedral. Among the portraits on the walls are the following:—George Abbott, Archbishop of Canterbury (master), John Potter, Archbishop of Canterbury, Bishop Bricroft (master), Dr. John Radcliffe, Sir Roger Newdigate, by Kirkby, William Scott, Lord Stowell, by Hoppner, John Sturt, Earl of Eldon, by Owen, Marquis of Hastings, 1771, by Hoppner, Dean Stanley, by Eddis, and Frederick Plumtre (master, 1836-70).

The old library with its picturesque high-pitched roof, and the kitchen under, was built in 1668-70, and is still standing, the library being fitted up as dwelling rooms.

The present library was built by Sir G. G. Scott, R.A., in the Decorated style, from funds provided by the executors of Lord Eldon, grandson of the Chancellor. In it are colossal statues of Lords Stowell and Eldon which have a strange history. They were designed by Sir Francis Chantrey in 1840, and died in the following year before anything was done to the work. The sculpture was commenced by Allan Cunningham, who died in 1842, continued by L. Watson, who died in 1843, and completed by Nelson.

The College MSS., 193 in number, dating from the twelfth century, have been placed in the Bodleian Library on loan. The library contains many rare and valuable works, among them the St. Augustine's "De Civitate Dei," 1473; a Sarum Missal, printed by Regnault, 1534, and many others.

The senior common-room was first used in 1679. The fine old carved panelling by Barker was put up in 1697. In it is a bust of Alfred, and portraits of Henry IV. and Essex, by James Griffith (master, 1807-21).

The master's lodgings were built in 1879, from designs by Boy & Garner, and form one of the finest residences in Oxford.

The buildings in the north-west corner of the college were erected in 1842, on the sites of Deep and Staunton Halls, from designs by Sir Charles Barry. On the intervening space, approached by a passage from the front quadrangle, is a chamber

with domed roof, erected in 1896 from designs by Basil Champneys, to contain the beautiful statue of the poet Shelley, by Onslow Ford, R.A., presented to the college by Lady Shelley.

No history of University would be complete without mention being made of the myth of King Alfred's connection with the college as its founder. In the annual calendar issued by the university, the college is said to have been founded by Alfred the Great in 872; and on June 12, 1872, the college celebrated with great pomp its alleged millenary. Ralph Higden, writing in 1363, says:—"Alfred was the first to establish schools for the various arts in Oxford, to which city he granted privileges of many kinds." James Parker, in his "Early History of Oxford," says:—"Asser, who was Alfred's contemporary, and has written a very full biography of him, knew nothing of the foundation (by Alfred), nor did any of the many writers who followed Asser until Edward III.'s time; the myth then suddenly springs into existence." In Alfred's will, in which names of upwards of fifty places are given, no mention is made of Oxford; and in the original documents connected with William Durham's bequest and foundation the existence of an earlier foundation is not referred to. From all we know of Alfred, and particularly of the care he took for the advancement of learning in England, he may have taken an active interest in the university and perhaps have established schools at Oxford, but that in no way proves him to have been the founder of University College, and of this important fact no title can be found.

*Queen's College.*

Queen's College was founded in 1340 by Robert de Eglesfeld, warden of St. Julian's Hospital, Southampton, and rector of Burgh, Cumberland. He was chaplain and confessor to Philippa, queen consort of Edward III., and in her honour called it "Aula Scholarium Regina in Oxon." The foundation was to consist of a provost and twelve scholars, or fellows—having reference to Our Lord and His Apostles—to be natives of Cumberland and Westmorland. The advowson was vested by the founder in the name of his royal mistress and in successive queens consort. Queen Henrietta Maria, Queen Caroline, Queen Charlotte and Queen Adelaide were among the benefactors of the college, and Queen Alexandra is a patron.

The main front of the college originally faced Queen's Lane. Temple Hall, the first residence of the scholars, stood on the site of the present college stables, but none of the early buildings now remain. The front in High Street was built in 1750-56 from designs by Nathaniel Hawkesmore. Over the entrance gateway is a cupola, supported by a double row of columns, containing a statue of Queen Caroline, consort of George II. The whole of the present buildings are in the Classic style.

The foundation-stone of the chapel was laid on February 6, 1714, the anniversary of Queen Anne's birthday. The east end is apsidal, the glass in the centre window representing "The Holy Family," painted by Joshua Price after Carlo Maratti. Of the other windows, six were painted by Abram Van Linge in 1635 for the old chapel; the two on either side of the west end are dated 1518. Over the altar is a copy, said to be by Mengs, of Correggio's "Night," in the Dresden Gallery. The painting on the ceiling is by Sir James Thornhill, and represents "The Ascension." There is a fine carved screen supported by Corinthian columns. The eagle lectern bears the date 1653, and the inscription "Regina avium, avis Regniensium" ("The bird of Queens is the queen of birds"). Two brass chandeliers hang from the ceiling that were given in 1721, and after having been lost for many years were recently found at Birkenhead and returned to the college.

The hall was erected about 1710 from designs by Sir Christopher Wren. On the walls hang portraits of Henry V., Edward the Black Prince, Edward IV., Charles I., Philippa (consort of Edward III.), Henrietta Maria (consort of Charles I.), Charlotte (consort of George III.), Caroline (consort of George I.), Robert de Eglesfeld (founder), John Michel (benefactor), Dr. Halton (provost 1677), Dr. Lancaster (provost 1704), Joseph Addison and others. The windows contain portraits of the founder, Edward III. and his queen, Edward IV. and Henry V., Charles I. and his queen, and Charles II. and his queen.

In the minstrels' gallery are other portraits and some interesting prints of the college before it was rebuilt. The old custom of bringing in the boar's head decked with bays and rosemary, to the singing of an old carol, is observed in the hall every Christmas Day, commemorating an act of valour performed by a student of the college, who, whilst walking one Christmas morning over Shotover Hill, studying Aristotle, was attacked by a wild boar, and with great presence of mind killed the infuriated beast by thrusting the philosopher down its throat. The memory of the founder is retained by another old custom. On New Year's Day the bursar presents each member of the college who dines in hall with a needle and

\*A paper read by Mr. Frank E. Spiers before the members of the Upper Norwood Athenæum at Oxford.

thread, saying "Keep this and be thrifty," it being a rebus on Eglesfeld's name (*aiguille et fil*).

The library is one of the finest in Oxford. Dr. Barton (Provost 1657, Bishop of Lincoln 1675), at one time keeper of the Bodleian, bequeathed the greater portion of his library to the college in 1691, and in the following year the present library was commenced, great part of the cost being borne by Dr. Halton, the provost, who also gave his collection of books. Dr. Mason, who died in 1841, bequeathed to the college his valuable library and collection of antiquities, and the sum of 30,000*l.* for the purchase of books, and in consequence the lower library was added in 1845-46. There are upwards of 94,000 volumes in the library. The ceiling is elaborately decorated in plaster, and the carving of some portion of the book-cases and the two handsome presses in which the MSS. are kept is by Grinling Gibbons. A curious statue of Queen Philippa that used to be in the hall, but on its removal was lost or disposed of, was discovered at Wolvercot in 1891 and returned, and is now in the library. The north window contains the portraits of Henry V. and his uncle, Cardinal Beaufort, under whom he studied. This glass was originally in a window of the rooms occupied by the Prince when in residence at Queen's. For many years it was lost sight of, but was recovered by Alderman Fletcher, of Oxford, and restored to the college.

#### *Oriel College.*

Oriel College, originally entitled "The Hall of the Blessed Mary at Oxford," was founded by Adam de Broome, almoner to Edward II. He was presented by the king to the rectory of St. Mary the Virgin in 1320, and on April 28, 1324, he obtained letters patent from the king to found a college for scholars in Oxford. He purchased Tackley's Inn (now 106 High Street) and Perilous Hall, in Broad Street, for the purpose, and appointed John de Laughton first rector. On January 1, 1325-26, Adam de Broome, in order to give greater stability to his college, surrendered it to the king, who, on the 26th of the same month, granted its first charter, in which he connected himself with the foundation. By the statutes, which bear the same date, the college was to be governed by a provost, and Adam de Broome was appointed by the king to the post. The college was re-endowed by the king, and the revenues of St. Mary's Church were appropriated to its use. At this time the scholars were removed to the rectory of St. Mary's Church, now St. Mary's Hall. On May 23, in the same year, new statutes were issued in the king's name placing the college under the direct patronage of Henry de Burghash, Bishop of Lincoln. Adam de Broome died January 16, 1332, and was buried in St. Mary's Church. In 1327 the college acquired Senescal Hall, known as "La Oriole," standing at the corner of Schidyrd Street (now Oriel Street) and St. John Street (now Merton Street), the site of the present front quadrangle. From a colloquial appellation "Oriel" ultimately became the name of the college. Other tofts and tenements north of this and extending west to Grope Lane (now Grove Street) were acquired before the end of the fourteenth century. Bedel Hall, to the south of St. Mary Hall, was added in 1452, and St. Martin's Hall, the site of the present chapel, in 1502, these completing the whole of the present site. There were ten open fellowships on the original foundation. In 1440 John Frank left 1,000*l.* for four additional fellowships, one each for the counties of Dorset, Somerset, Wilts and Devon; in 1441 Provost Carpenter endowed one for Worcester, and later Bishop William Smythe one for Lincoln. The Scholars or Fellows were, until 1584, all graduates who had passed their bachelor degree. After that date commoners were admitted as members. For many years there had been a few exhibitions connected with the college, and at times paying scholars; these had been lodged in St. Mary Hall. About 1586 St. Mary Hall was severed from the college, though a certain connection between the two establishments was always kept up, the principals of the hall having invariably been Fellows of Oriel.

During the provostship of Anthony Blencowe (1574-1618) it was resolved to rebuild the college. Blencowe left 1,300*l.* for that purpose, and in 1619 the work was commenced, it being completed in 1642.

The west and south fronts were pulled down in 1619-20, and immediately rebuilt, the north and east sides of the quadrangle, including the hall and chapel, being rebuilt in 1636-42.

The hall occupies the east side of the quadrangle, and is entered from a flight of steps under a large open portico bearing the inscription "Regnante Carolo." Over the entrance are statues in canopied niches of Edward II., the Royal Founder, and Charles I., surmounted by the figure of the Virgin and Child. It is a fine hall with hammer-beam roof and louver, the lower part of the walls being panelled in oak. At the south end is a Gothic screen, with minstrels' gallery over the vestibule. Among the portraits on the walls are the following:—Edward II., Queen Anne, Sir Walter Raleigh, Charles, Duke of Beaufort, John Rowse (Bodleian Librarian), Bishop Robinson (Fellow 1675-86), Joseph Butler, Bishop of Durham

(Graduate 1718), Bishop of Dromore (Fellow 1798), John Keble (Fellow 1811), Whateley (Fellow 1811) and Thomas Arnold, of Rugby fame (Fellow 1815). The college is fortunate in having preserved the founder's cup, in silver gilt, bearing the initials E, the mazer bowl and cocoanut cup mounted in silver, given by Provost Carpenter, 1435, and other valuable pieces of old plate.

The church of St. Mary the Virgin served the purpose of chapel until the end of the fourteenth century, when a license was obtained to celebrate Mass in a chapel or oratory to be built within the college. This was erected on the south side of the quadrangle opposite the present gateway of Corpus Christi College, at the cost of the Earl of Arundel and his son the Bishop of Ely. The present chapel was built on the site of St. Martin's Hall, and opened for Divine service in 1642. It has undergone several restorations from time to time, the most important being in 1884, when, under the care of Mr. T. G. Jackson, R.A., the present east window was inserted to the memory of Provost Hawkins, the screen was moved further to the west, and the chamber that had formed Newman's oratory was thrown into the chapel to form the organ loft. The bronze eagle was given in 1654.

In the inner quadrangle the rooms on the right were built by Bishop Robinson in 1721, those on the left having been built out of a fund bequeathed by George Carter (provost 1708-27).

Lord Leigh, of Stoneleigh, having bequeathed the whole of his valuable library to the college, the rooms previously used as the library were not large enough, and the present Class building was erected in 1787-88 from designs by James Wyatt. It contains a good collection of MSS. and printed books, the most of special interest being an Aurelius Prudentius, probably 10th century; MS. of Eusebius, 12th century; MS. of Pie Ploughman; Cicero's "De Officiis," printed at Mainz; the rare "Egidius, "De Peccato Originis," of which only two other copies are known to exist; several folio volumes containing rare prints, and a first folio Shakespeare, given by Lord Leigh. There are also busts of Edward II. and John Copleston (provost 1814-28), and a chair formerly belonging to Gilbert White of Selborne.

Under the library are the two common rooms, which are rendered specially interesting by the large collection of portraits of old Oriel men they contain, and also for discussions and events that have taken place within their walls. The portraits are so numerous that only a few of the most important can be mentioned here:—Edward II., Bishop Smythe, Sir Walter Raleigh, Chief Justice Holt, Thomas Arnold, John Eveleigh, Bishop Butler, William Prynne, Benjamin Brummell, John Keble, Bishop Copleston, Dean Church, Dean Ireland, Cardinal Newman (by Oules), Edward Hawkins, Matthew Arnold, J. Anthony Froude, Lord Herbert of Lea, Bishop Wilberforce, Bishop Stubbs, Dean Burgon, Lord Balfour of Burleigh, Thomas Hughes, Goldwin Smith, Gathorne Hardy and Cecil Rhodes (by Coke).

By the recent death of the Rev. Dr. Chase, late principal of St. Mary Hall, under a statute made by the last University Commissioners, the Hall now becomes incorporated with the college. This will enable the trustees under the will of the late Cecil John Rhodes to extend the college buildings to the High Street, an extension necessitated by the large number of colonial and other scholarships created by Mr. Rhodes' munificent benefactions.

#### *Merton College.*

Merton College was founded in 1264 by Walter de Merton, Lord High Chancellor to Henry III. and Edward I., and Bishop of Rochester. He was born at Merton, in Surrey, whence he took his name, and received his education at Meon Priory and Oxford. His college, which was the first self-governing corporate community in Oxford, and may therefore claim to be the oldest collegiate establishment, was founded in connection with a "House of Scholars" at Malden. The Oxford scholars were first lodged in hired dwellings, but during the years 1266-68, with the support of the king, to whom the founder had great influence, the site of the present buildings was acquired, together with the appropriation of the church of St. John the Baptist. The founder's first statutes for the government of his two houses were dated 1264 and were revised by him in 1270. He transferred the Malden House to his college at Oxford in 1274, when he gave an enlarged code of statutes to the college which bore the seal of the king. So complete were these statutes that they were generally accepted as a model by the early collegiate foundations of Oxford and Cambridge. Walter de Merton was Chancellor to Henry III. in 1258 and again in 1260. Having the seals of office on the death of the king he became practically regent until Edward returned from his crusade in 1272. He then delivered up his seals and devoted himself entirely to his college prior to taking up his episcopal duties at Rochester. He died in 1277, leaving 1,000 marks and the residue of his large estate to his college, and was buried in Rochester.

hedral. His foundation was confirmed by the Bishop of  
coln in 1276 and received the solemn confirmation of  
e Nicholas III. at Rome in 1280. A second charter was  
nted by Henry VI. in 1444. John Wyllyot, who was a  
w of the college in 1334 and Chancellor of the University  
r 1349, instituted in 1380 an order of poor scholars, or  
ibitioners, called "portionists," now known as postmasters,  
y were until about 1600 housed in a hall opposite the col-  
e, where subsequently Anthony Wood was born. In 1479  
moners were first admitted to the college. Queen  
harine of Aragon visited the college in 1518, Queen  
abeth in 1592 and James I. in 1602. Charles I. was a  
uent visitor, first in 1619 with his queen and in 1643,  
le Queen Henrietta Maria stayed in Merton, Charles was  
ed at Christ Church for three years. During this time and  
le the Parliament was held at Oxford, the fellows of Merton  
ear to have had great influence on events in Oxford.

The gateway and tower were built in 1418; over the  
erance is a curious old sculpture representing St. John  
Faching in the Wilderness, said to have been taken from the  
ol church of St. John the Baptist, having on either side a  
copped niche containing figures of Henry III. and the  
rider. The college front on the left of the gateway was  
uilt in 1588-91, St. Alban's Hall 1599, and the buildings on  
t right in 1631, the whole of the front having been restored  
in 1838.

The old refectory was built towards the end of the thir-  
e-th century. It was almost entirely reconstructed in 1790-  
4 the only old work that was retained, besides the shell, being  
h doorways and the old north door of oak with its beautiful  
eenth-century iron hinges. It was carefully restored by  
Si G. G. Scott in 1872-74, when the present open timber roof,  
pelling and oak screen were put up and the original character  
of the building somewhat reinstated. A minstrels' gallery  
occupies the west end over the entrance vestibule. Among  
h portraits on the walls are those of the founder, Duns  
Stus (a copy of the portrait in the Bodleian), Sir Henry  
Salle (Warden 1586-1622), Sir Thomas Bodley (Fellow 1613),  
Bishop Barrington (Fellow 1755), Bishop Denison (Fellow  
1761-37), Dr. Marsham (Warden 1826-80), Hon. Geo. C.  
Bidrick (present Warden), painted by R. W. Macbeth,  
A. A., and others.

The treasury is the oldest part of the college; it is built  
nely of stone with an ashlar roof, is fireproof, and was pro-  
bay the counting-house of Jacob the Jew, from whom the  
rder purchased this portion of the site.

The parish church of St. John the Baptist, which existed  
pr to the foundation of the college, was granted in 1266 to  
h scholars of the House of Merton by the Abbey of Reading,  
an has since formed the chapel of the college. The parish ser-  
vices continued to be held here until 1891, when they were trans-  
ferred to St. Peter's in the East and the two parishes incorporated.  
On the north door are statues of St. John the Baptist and  
th Virgin Mary. The choir was rebuilt in 1294-97, the win-  
dws being remarkably fine examples of Early Decorated  
wc. The tower is a little later, and the transepts were built  
in 1360 and completed in 1424-25. The beautiful bell tower  
was finished in 1451. The founder's design was probably to  
ad a nave and aisles, but this intention was delayed, owing  
paly to the want of funds, and subsequently the ground to  
th west of the chapel was sold to Corpus Christi College,  
wn all hopes of the completion of the building were  
deroyed. The present form of building with choir and tran-  
se, or ante-chapel, appears to have served as the model for  
otr college chapels. Besides the high altar, which was  
de cated in 1277, there were originally four other altars in the  
ch. There is a piscina, with a curious quatrefoil squint in  
th recess above, and handsome sedilia in the choir, and also  
ach piscina in the south transept. The stained glass in the  
ro of east window was inserted in 1671; that in the lower  
pa, representing events from the life of Our Saviour, was  
pated by W. Price in 1702. The glass in the north and south  
winds of the choir was given by Henry de Mamesfeld in  
12. The west window contains some fifteenth-century glass.  
The ceiling of the choir was put up in 1497, and redecorated in  
18 from designs by the Rev. J. Hungerford Pollen, a Fellow  
of the college. The transepts were ceiled in 1517-18. The  
alt piece, representing the Crucifixion, said to be by Tintoretto,  
wa presented in 1779. The stalls were put up in 1851 and the  
bra lectern given in 1458. There are two fine brasses in the  
ch; that on the north side being to the memory of John  
Blham (Warden 1375-87) and John Whitton, rector of  
Wdeaton (a benefactor), and that on the south to Henry  
Seir (Warden 1455-71). In the north transept is a good brass  
to chard de Hakeborne, c. 1311, and mural monuments to  
Sir Thomas Bodley, Sir Henry Savile, Bishop Earle, Sir  
Anthony Wood, ob. 1695, and many others.

The sacristy, adjoining the chapel, was built in 1311. It  
wa n 1827 perverted to the use of the college brewhouse, but  
in 78 was refitted, and since then the valuable MSS. have  
be kept there.

The library is probably the oldest example of a Mediæval  
library in England. It was built and given to the college by  
William Rede, Bishop of Chichester, in 1377-79. It comprises  
two rooms on the west and south sides of Mob Quadrangle,  
connected by a vestibule. The waggon vaulted ceiling was put  
up in 1502-3 by Warden FitzJames and bears his arms (a dol-  
phin), the Royal arms, Tudor rose, &c. It is lit by the original  
lancet windows and dormer lights added later. The rough  
hewn benches, bookcases in west room and half-case numbered  
45, having the old chains still attached to the books, as was the  
case throughout the library until 1792, and the glass bearing  
labels "Ecce Agnus Dei," are all original work. In 1623 the  
open space at the end of the south wing was added by Warden  
Brent, the dormer windows were inserted, the screens and other  
woodwork was put up, and the encaustic tiles laid in the gang-  
way. The glass in the east window, bearing date 1598, was  
given in 1841. The college has been fortunate in preserving  
no less than 347 of its old MSS. though many have disappeared.  
A large number were disposed of, or destroyed, by Edward  
VI.'s visitors in 1550, among them 65 out of the 99 given by  
Bishop Rede. The library contains over 18,000 volumes, among  
them being the works of Duns Scotus, St. Augustine, St.  
Gregory, St. Thomas Aquinas, St. Jerome, Arabic MSS., a fine  
copy of the first Caxton edition of Chaucer, "The Tatler," given  
by Robert Steel, and many others. It is particularly rich in  
theological, mathematical, astronomical, physical and philo-  
sophical works.

The buildings on the north and east sides of Mob Quad-  
rangle are probably c. 1311. The warden's house dates from  
1483, but it has had many alterations and additions, the last in  
1836-38.

The Fellows' quadrangle was built in 1608-10 by Thomas  
Holt, who was responsible for the old Schools and Wadham  
College. The fine entrance gateway, with groined vaulting and  
the queen's chamber above, bears the arms of James I. and  
the founder, and displays the Doric, Ionic, Corinthian and  
Composite orders of architecture.

The first Fellows' common room in Oxford was established  
at Merton in 1661 in its present room above the kitchen, with  
cock-loft over it. It was panelled in 1671-80 and ceiled in  
1762. On the walls are portraits of John Chambers (Warden  
1525-44), Bishop Jewell (1559-71), Burleigh, Abraham Cowley  
(poet), Wyclif and others.

St. Alban's Hall, now part of the college, was the residence  
of Robert de St. Alban early in the thirteenth century. He  
gave it, with Nunne Hall adjoining, to the convent at Little-  
more. It was confiscated at the Dissolution, purchased in 1549  
by Merton College, and was kept up as a separate establish-  
ment until 1881, when, under the statutes of the University  
Commissioners it was incorporated with the college.

The new buildings in the Grove are from designs by  
Butterfield. They were opened June 15, 1864, when the sex-  
centenary of the foundation of the college was celebrated.

The gardens are exceedingly picturesque, with charming  
views of Christ Church Meadows, the Cathedral, Magdalen  
Tower, &c. They are bounded on the south and east sides by  
the old city walls and bastions. (The old mulberry tree was  
planted c. 1620.)

#### *Corpus Christi College.*

Corpus Christi College was founded in 1516 by Richard  
Foxe, Bishop of Winchester and Lord Privy Seal to  
Henry VII. and Henry VIII. In his statutes of the following  
year he dedicated the college to "The praise and honour of the  
most precious Body of Christ, of His Spotless Mother, &c." Hugh  
Oldham, Bishop of Exeter, gave 6,000 marks towards  
the cost of the building. Bishop Foxe was the first to make  
provision for the study of Greek in the university by the insti-  
tution of a public professorship for that purpose.

The college adjoins Merton on the west, the site having been  
purchased partly from that college. Over the entrance gate-  
way, which has a very beautiful vaulted roof, is a curious  
carving representing angels bearing the Host, or Corpus  
Christi, in a monstrance, with the arms of the founder and the  
See of Winchester on either side. On entering, a conspicuous  
object in the centre of the quadrangle is a cylindrical sun-dial,  
designed and presented to the college by Charles Turnbull,  
a Fellow, in 1605, and which forms a perpetual calendar. It  
bears the arms of Henry VIII., the University, Bishop Foxe  
and Bishop Oldham, and is surmounted by a pelican, the crest  
of the founder and badge of the college.

The quadrangle was completed in 1517, embattled in 1609,  
and an additional storey added to the north and west sides  
in 1737.

On the left is the hall with a fine hammer-beam roof, a  
good specimen of Late Perpendicular work. The wainscoting  
and screen was put up in 1700. On the walls are portraits of  
the founder painted on panel by a Fleming named Joannes  
Corvus, Bishop Oldham, Lord Stowell, Lord Tenterden, Bishop  
Copleston, Henry Phillpotts, Bishop of Exeter, Dr. Buckland  
and others.

The chapel on the south side was completed in 1517 and has been subjected to many alterations from time to time. The screen of cedar wood was put up in 1677 and the panelled ceiling renovated in 1843. Over the altar is an original painting by Rubens, representing "The Adoration," from the collection of the Prince de Condé at Chantilly. The eagle lectern was given by John Claymond, the first president (1516-34); a very perfect brass to his memory is in the antechapel. The college possesses Bishop Foxe's crozier in silver gilt, a beautiful specimen of early sixteenth-century work, a golden chalice and paten given by the founder dated 1507, and other valuable sacramental and other plate, rings, &c.

The library is to the west of the chapel and contains an exceedingly good collection of early MSS., printed books, political tracts dating from the fifteenth century, one of the original volumes given to the Bodleian Library by Duke Humphrey, a complete set of Aldine classics used by the founder and other works. The original sockets for the iron rods, to which the chained books were attached, are still fixed to the shelves. The doors at either end are good examples of Tudor carving, and the stone mouldings on the walls deserve attention. At the east end is a gallery overlooking the chapel, formerly used as the President's private pew, and at the west end is the muniment-room.

South of the chapel is a small cloistered court that serves as a last resting-place for many old members of the college.

The Fellows' buildings, with the common room erected by Thomas Turner (president 1687-1714) at his own cost from designs by Dean Aldrich, are approached from the cloisters. Beyond are the Fellows' gardens, formed on the ramparts of the old city walls and overlooking Christ Church Meadows.

The President's lodgings date from 1591-1601, and on the visit of the allied sovereigns to the university in 1814 they were occupied by the King of Prussia. Originally the President used the rooms over the entrance gateway, one of which has a fine Tudor ceiling.

Additional buildings were erected at the corner of Merton Street and Grove Street in 1884, in the Jacobean style from designs by T. G. Jackson, R.A.

Among leading men who have been members of Corpus Christi College may be mentioned Bishop Jewell (author of "Apologia"), Richard Hooker (the judicious), Cardinal Pole, the last Catholic Archbishop of Canterbury (Fellow 1523), William Scott, Lord Stowell, Lord Tenterden (student 1781), Edward Copleston, Henry Phillpotts (Bishop of Exeter), Nicholas Udall (headmaster of Eton), General Oglethorpe (founder of the State of Georgia), Dean Buckland, Thomas Arnold (headmaster of Rugby) and John Keble, who entered as a scholar in 1808, when in his fifteenth year, and on taking a double first in 1811 accepted a Fellowship at Oriel.

#### *University Examination Schools.*

The New University Examination Schools were erected in 1877-82 upon the site of the old Angel Hotel, from designs by Mr. T. G. Jackson, R.A., at a cost of about 100,000*l.* The building forms a quadrangle, of which three sides are at present completed. The large entrance hall in the High Street is panelled in oak, with carved oak ceiling and tie-beam roof, the principal examination rooms being treated in a similar manner. The vestibules are supported by columns of rare marbles, the shafts of two in the south-west of the building being solid blocks of the famous Cippolini marble, for which the old quarry was specially opened. Other fine specimens of valuable marbles are seen in the balustrades and panels of the corridors and staircases. There are nine *viva voce* rooms on the ground floor, the writing-rooms being all on the floor above.

Adjoining the Schools, on the east side, is a building erected by Mr. Jackson in 1887 for the delegates of unattached or non-collegiate students of the University.

In conclusion I have to express my indebtedness for the valuable information I have obtained from the following works:—"The Colleges of Oxford," Andrew Clark, M.A.; "Merton College," B. W. Henderson, M.A.; "University College," William Carr, M.A.; "Oriel College," D. W. Rannie, M.A.; "The Early History of Oxford," James Parker; "Oxford and its Colleges," J. Wells, M.A.; "The Life of Walter de Merton," Edmund Bishop of Nelson, and the very excellent Oxford guide-books published by James Parker & Co., Alden & Co. and A. T. Shrimpton & Sons. Finally, I desire to record the best thanks of myself and other members of the Society to the Master of University, the Provost of Queen's, the Provost of Oriel, the Warden of Merton and the President of Corpus Christi for facilities given to see over their colleges and inspect the treasures therein, and especially to Mr. A. B. Poynton, M.A., bursar of University, for so kindly meeting the members and personally conducting them over his college.

#### THE ARCHITECTURE OF JAMAICA.\*

OF the dwellings of the aboriginal inhabitants of Jamaica no traces remain to-day. Indeed, no traces remain when Penn and Venables took the island. This is not to be wondered at, for we know that the quiet, inoffensive Arawaks were in no sense of the word builders. Unlike the Toltecs and Aztecs of the mainland, they were content with the humblest of dwellings, such as may be seen in the wilder parts of Guiana to-day, where of the forest houses those of the Arawaks are far the cleanest and best cared for. But while, except in the savannahs (a rare position for an Arawak dwelling) where the form is either round or oval, made so as to offer, it is thought, as little resistance to the wind as possible, the native dwellings in Guiana are usually rectangular, we may, perhaps, assume that those of the inhabitants of Jamaica when Columbus discovered it were circular in shape, for the "Historie" of Fernando Colombo, his son, in describing Guadeloupe on his first discovery, says:—"Their houses, instead of the ordinary round forms which had been hitherto met with in the West Indies, were square."

The natives of Guiana used the following plants which supplied materials for their houses—trollie palm, dwarf palmetto, cokerite or turu palm and oéta palm. None of these plants are, however, native of Jamaica, but the following probably to their place:—Thatch palm, bullthatch, palmetto thatch, silvethatch, wild plantain and aroid. The leaves of all these could be used for thatch for roofs or walls, and the stems of the palms would supply posts and beams. The houses were probably provided with substantial walls of wattled mud, plastered with mud, and the conical roof of palm leaves was high pitched. When on hunting expeditions they erected Guiana temporary huts called benabs.

Of the buildings erected by the Spaniards no remains which can be identified with any certainty exist. In various parts of the country one comes across so-called Spanish bridges and Spanish wells, and in some of them there may be examples of Spanish masonry.

The principal towns erected by the Spaniards were Meha, the first town founded by them, near Port Maria; Sevilla Nueva, founded by Juan de Esquivel in the early days of the sixteenth century, near St. Ann's Bay; and St. Jago de Vega, the modern Spanish town. Of their buildings in general, Sir Hans Sloane, who was here in 1687-88, only thirty-two years after the conquest, says that they were "usually one storey high, having a porch, parlour, and at each end a room, with small ones behind. They built with posts put deep into the ground; on the sides their houses were plastered up with mud or reeds, or made of the split trunks of cabbage trees nailed close to one another and covered with tiles or palmetto thatch. The lowness, as well as fixing the posts deep in the earth, was for fear their houses should be ruined by earthquakes, as still is the case for coolness." It seems strange, according to modern ideas, to build a house one storey only for coolness; although "a for-ever resident in the West Indies" has recently suggested that we should build our churches and markets underground.

Long tells us that "a certain number of posts of the hardest timber, generally lignum vitæ, brazilletto, or fustick, of about 18 feet in length and 6 to 8 inches in diameter, being first well-seasoned and hardened in smoke, were fixed at proper distances to the depth of 2 or 3 feet in the ground; then a wall of bark, enclosing these posts, was carried up with very strong mortar to the plate, which was pinned with wooden spikes to the tops of the posts. The main rafters were small, but being of the like hard wood, and perfectly well-seasoned, were sufficiently strong; these were likewise pinned upon each other, and at their angle of intersection at top formed a crutch to receive the ridge pole. The smaller rafters were of the lesser empty trees, stripped of their bark, hardened in smoke, notched at bottom, and being placed at the distance of about 18 inches from each other, were pinned to the plate. Athwart the whole all rafters a stratum of the wild cane (*Arundo Indica*, bamboo species), previously smoked, was tied on by way of wattling with straps made of the bark of mahoe or mangrove trees. Upon these wattles some mortar was laid, to the thickness of about 4 inches; and the whole covered with large pantiles, well bedded in. The thickness of these roofs, from the outward shell or tile-covering to the ceiling within, was about 8 or 10 inches. A canopy of so solid a texture was certainly well contrived to shelter the inhabitants from the disagreeable effects of a vertical sun, and accordingly it is found by experience that the old Spanish houses are much cooler than our modern ones covered with shingles. After regretting the failure to establish a manufacture of tiles, and the importation of North American shingles, Long goes on to say:—"The chief error the Spaniards committed in their buildings was the placing their ground

\* A lecture by Mr. F. Cundall delivered in the hall of the Institute of Jamaica.

ers too low; these were nearly on a level with the surface of earth out of doors, or at most raised only a few inches higher." In his time there were upwards of fifty Spanish houses remaining in Spanish Town, "very little the worse for weather."

Sloane on his expedition to the north side visited Sevilla Nueva. He says:—"I observed the ruins of the town called Sevilla, among which a church built by Peter Martyr of Angiera, of a sort of freestone (to be had near this city) and bricks. A pavement was found two miles from this church; the city was so large it had a fortified castle, the walls of which were made of stones and bricks, 4 feet thick; it was and is a good port. . . . The town is now Captain Hemming's plantation. The church was not finished; it was 30 paces broad and 30 paces long. There were two rows of pillars within; over the place where the altar was to be were some carvings under the ends of the pillars. It was built out of a sort of stone between freestone and marble, taken out of a quarry about a mile up in the hills; the houses and foundations stand for several miles along. The road towards the country is rising. Captain Hemmings told me he sometimes found pavements under his canes, 3 feet thick, covered with earth, and several times wells, and sometimes mill-stones finely cut. There are the beginnings of a great city called a monastery, but I suppose the house was designed for the Governor. There were two coats-of-arms not set on a ducal one, and that of a count, I suppose belonging to Columbus's family, the proprietors of the island. There have been raised a tower, part brick and part hewn stone, as also several battlements on it, and other lower buildings not finished. At the church lie several arched stones, complete it, which had never been put up, but lay among the ruins. The rows of pillars within were for the most part plain. At the time of the Spaniards it was thought the Europeans had been cut off by the Indians, and so the church left unfinished. When the English took the island the ruins of this city were overgrown with wood that they were all turned black; nay, I saw mammees, or bastard mammees grow within the walls of the tower, so high that it must have been a very large gun could it have been fired from the top of it, and most part of the timber fell'd off the place, when it was planted, was 60 foot or more long. A great many wells are on this ground. . . . The west gate of the town was a very fine work, and stands very entire; it was 12 feet wide, and as high before the arch began. Over the door in the middle was our Saviour's head with a crown of thorns, and then two angels; on the right side a small round figure of a saint with a knife struck into his head; on the left a Virgin or Madonna, her arm tied in three places, Spanish fashion. Over the gate, under a coat of arms, this inscription:—"Peter Martir ab Angleria Italvs Civis Mediolanen. Prothonotarius Insulæ Abbas Senatus Indici Consiliarius Ligneam hanc primus a Fundamentis Extruxit." Which Long thus translates:—"Peter Martir, of Anghiera, an Italian citizen of Milan, chief missionary and abbot of this island, member of the council of the Indies, first raised from its foundation, with this square stone, this edifice, which formerly was built of wood, and twice destroyed by fire."

This Peter Martyr must not be confounded with his namesake Pietro Martire Vermigli (1500-62), of Florence, who at the instance of the professor of theology at Oxford. Our Peter Martyr was Pietro Martire of Anghiera (1455-1526), a native of Arona, Italy, Apostolic Protonotary, and a member of the Council of the Indies to Charles V. and first abbot of Jamaica. He was the prototype of the absentee proprietor; he never set foot in the island. He is best known by his work entitled "De Orbe et Populo," commonly called "The Decades." The "some saint with a knife struck into his head," mentioned by Sloane, was the Dominican saint of the thirteenth century, well known to the artists of Mediaeval Christian art, especially by reason of the world-famous painting of his martyrdom, and the figures after whom the two sixteenth-century Peter Martyrs were named.

At the time that Long wrote (1774), nearly a century later than Sloane, several fragments of carved work in stone "that could be thought no mean ornaments in an European church" were still to be seen there, and the ruins of two edifices, one of which had been a castle and the other probably the collegiate church, were still remaining separated by about half a mile. The walls were compacted with a very hard cement, and were several feet in thickness. But he mentions that these walls were every day diminished for the sake of the materials, which were used in repairing the buildings on the estate, so that the remains of the castle were then below the surface of the earth. In 1764 he tells us there were dug up two columns of about 7 feet in length, "of no particular order, but somewhat resembling the Ionic," on which were "some carvings in relief." Four or five coarse images were likewise found, one of which resembled a sphinx, another an alligator, and the rest creatures of the mason's fancy.

Long says that the Spaniards abandoned Sevilla Nueva

because the south side ports were more convenient for the galleons and other vessels passing between St. Domingo and Carthage.

The foundations of St. Jago de la Vega were probably laid by the then Viceroy, Diego Columbus, about the year 1523. His son Lewis, created Duke of Veragua, had for a second title Marquis de la Vega, after this town. Hicqueringill (writing in 1661) tells us that when the English took the island it contained 2,000 houses, sixteen churches and chapels and one abbey, and that of these the English soldiery left but two churches and 500 houses undemolished, but it is thought by Long that this was an exaggeration.

Of the ecclesiastical buildings at St. Jago de la Vega trustworthy records exist only of an abbey, and a chapel of the red cross and a chapel of the white cross. The present cathedral stands on the site of the red cross chapel. The bases of two piers (he calls them columns) 8 feet square, part of the entrance to the abbey (which stood to the south of the present parade), were, in Long's time, standing near the south end of the public offices. They were of brickwork, strongly cemented. Long goes on to say:—"I have seen in this town a great many large stone mouldings for the bases and other parts of columns, which, as well as the sculptures dug out of the ruins of Sevilla Nueva, in St. Ann's, appeared to have been executed by no mean artists. The Spanish ecclesiastics . . . must be allowed some merit in having cultivated the elegances of architecture in these remote parts of the world. Some of their public structures at St. Domingo, the Havannah, La Vera Cruz, Carthage, Panama, &c., would make a noble figure even in European cities." Unfortunately it would seem that, judging from his comments on buildings still standing, art criticism was not one of Long's strong points.

The original English church at Spanish Town was destroyed by the hurricane of August 28, 1712. The present structure was rebuilt upon its old foundations in 1714. In 1762 it received thorough repair, and in 1817 the tower was raised. In 1901 it was restored in memory of Queen Victoria.

Hakewill (1821), one of the few artists who have ever seen the cathedral, calls it "an ancient brick structure of no exterior beauty." In Roby's time (1831) the walls were wainscotted, and the roof was coved and ornamented with circles, ovals and lozenges. The original residence of the governors consisted partly of the old Spanish edifice and partly of irregular additions made from time to time by Sir William Beeston and other governors. The Spanish hall of audience was demolished in 1761 to make way for the present building. Of it, Long says:—"Nothing of art or elegance graced the inside of this hall: it was lined throughout with boards, or rather planks, unequally hewn with an adze, none of them appearing to have undergone the embellishment of the plane; these were rudely nailed to upright posts, which supported the roof. The posts were for the most part crooked, not even squared, and many of them had some remnant of their bark, but they retained for the most part their primitive solidity. The whole of the woodwork, indeed, seemed to have passed through no other hands than those of a clumsy ship-carpenter." This description might almost apply to the dwellings of the native Arawaks. The plan of the present building was designed by Craskell, the engineer of the island, and the work was finished in 1762 during the governorship of William Henry Lyttelton.

The expense of building and furnishing amounted to nearly 30,000*l.* currency (or 21,428*l.* sterling), and in Long's time it was "thought to be the noblest and best edifice of the kind, either in North America or any of the British colonies in the West Indies." Monk Lewis, writing in 1834, says more truly:—"The Government House is a large, clumsy-looking brick building with a portico, the stucco of which has suffered by the weather, and it can advance no pretensions to architectural beauty." The façade is about 200 feet long; the free-stone used in the construction came from the Hope river course in St. Andrew. The columns of the portico are of Portland stone, the pavement of white marble, of which much came out, as ballast, from time to time in the old sugar ships, and is still seen in many a great house and town dwelling.

In 1672 Port Royal contained 800 well-built houses. Twenty years later, when it was at its zenith, the number was 2,000, "the greater number of which were of brick, several storeys in height." In 1692, as is well known, a large part of the town perished by an earthquake, and from that event Kingston dates its origin, Port Royal being partially destroyed again—by fire in 1703 and by hurricane in 1722.

Charles Leslie, writing in 1739, says of Jamaica:—"One is not to look for the beauties of architecture here; the public buildings are neat but not fine. The churches in the town are generally in form of a cross, with a small cupola a-top, built high in the walls, paved within, and adorned with no manner of finery." The churches, he says, except those at Spanish Town and Half-way Tree, are "decent small houses, scarce to be known for such," and he adds, "the clergy trouble them little, and their doors are seldom open," in marked contrast to the present state of affairs. "The gentlemen's houses," he

says, "are generally built low, of one storey, consisting of five or six handsome apartments, beautifully lined and floored with mahogany. . . . In the towns there are several houses which are two storeys, but that way of building is disapproved of because they seldom are known to stand the shock of an earthquake or the fury of a storm."

On Craskell & Simpson's large map of Surrey, of the year 1763, is shown a view of a presumably typical Jamaica house, two storeys high, with an open verandah in front only. It is evident from what Long says that, at all events for the first century of the island's occupation by the British, not much attention was paid to domestic architecture by the planters of the island. "It is," he says, "but of late that the planters have paid much attention to elegance in their habitations; their general rule was to build what they called a makeshift; so that it was not unusual to see a plantation adorned with a very expensive set of works, of brick or stone, well executed, and the owner residing in a miserable thatched hovel, hastily put together with wattles and plaster, damp, unwholesome and infested with every species of vermin. But the houses in general, as well in the country parts as the towns, have been greatly improved within these last twenty years."

In this connection mention may be made of the aqueducts on some of the sugar estates, which are amongst the best pieces of architectural work in the island. They and some of the old stone bridges compare more than favourably with the modern bridges, which—excellent monuments of engineering skill as they may be—their best friends would never venture to call many of them works of art. Moreover, the stone bridges will probably be standing when the iron ones have perished by decay.

Of planters' residences in Long's time, one of the finest is said to have been the Decoy, in St. Mary, the residence of Sir Charles Price, albeit it was built of wood. Peter Marsden, writing a little later (1788), says:—"Except a few excellent houses which have lately been built of brick and two or three of stone, after the English fashion, by rich merchants, the houses are in general of wood, very often mahogany, which is plentiful in this island. They consist but of a room or two below stairs, with piazzas all round and a storey above." Stewart, whose account of the island was published in 1808, gives much the same account of the domestic houses, but goes on to say:—"As for bridges and other public structures of the kind, in this part of the world there are few that deserve mention, except a neat cast-iron bridge imported from Great Britain, and some years ago thrown across the Rio Cobre. There is, indeed, often a marked deficiency here of public spirit in undertakings of this sort." Hakewill, writing in 1821, said, "The handsomest building in Kingston is the Scotch church in Duke Street, which was erected about the year 1814 by a public subscription from a plan of Mr. James Delancy," which does not say much for the rest of the buildings then existing.

I should like here to put on record my protest against the placing of the bust of the late Mr. Radcliffe in the inappropriate position which it occupies—blocking as it does the main entrance to the church, and giving an undue prominence to a man however good that man was. It was placed there in direct opposition to the expressed opinion of the sculptor, and I am sure that Mr Radcliffe would have been the first to condemn such a position for the bust or statue of any man.

Of Montego Bay Hakewill says:—"The church of this town is the handsomest in the island." Handsome is an adjective which hardly applies to this building, which exhibits a strange mixture of Classic and Gothic with an incongruous portico-like addition on the south side. But its tower is better than those of Spanish Town and Kingston.

One of the finest residences at one time must have been Colbeck, near Old Harbour; it is not mentioned by Long, or, in fact, by any other writer so far as I remember. Many of the houses on the sea coast were, in the eighteenth century, made defensible with loopholes, so as to guard against the attacks in war time of the enemy's privateers. Sir James de Castillo's house near Bull Bay was fortified by guns.

About the middle of the eighteenth century several of the finest houses in Kingston were built. Tradition says that three or four merchants of great wealth and equally great ambition as regards appearances made a heavy bet amongst themselves as to who should build the most magnificent residence. The result was, it is said, "Harmony Hall," the building to the north of the old Mico buildings (now the residence of Mr. Peet); "Jasper Hall," built by Jasper Hall, receiver-general and speaker of the House of Assembly (who called it "Constantine House"), which is dated 1st June, 1756; and "Head-quarter House," built by Thomas Hibbert (who came to Jamaica in 1734, and soon became one of the wealthiest merchants in Kingston), and formerly known as "Hibbert's House." Mr. Schiller's house, just north of Halfway Tree, is dated September 3, 1767.

The town of Kingston was laid out by Colonel Christian Lilly at the earliest in 1695, and not as Long and other historians say in 1693, for the simple reason that Lilly did not

reach Jamaica till 1695. The land was purchased from the Governor, Sir William Beeston, whose name still survives in Beeston Street. In his plan Lilly adopted the chess-board fashion of all Spanish cities in the New World—a plan which is at least as old as the Romans. If one omits the lanes, the plan of Kingston as laid down by Lilly in the seventeenth century is precisely the same as that of the recently unearthed Roman city of Calleva (Silchester) of thirteen centuries earlier, with its *insula* prototypes of the American blocks. Kingston consisted then of a parallelogram, one mile in length from north to south, and half a mile in breadth, regularly traversed by streets and lanes, alternately crossing each other at right angles. When Long wrote it contained "sixteen hundred and fifty-five houses, besides negro houses and warehouses; so that the whole number of its buildings, including every sort, may be computed at between two and three thousand, and thirty-five spacious streets and sixteen lanes." At present there are in Kingston 171 streets and sixty-nine lanes and about 9,000 houses.

Unfortunately Lilly when he planned Kingston, when land was cheap, omitted to leave room for lines of trees down each principal street. Had this been done, shade would have been afforded to drivers and pedestrians alike and a picturesque feature would have been assured for the town. Moreover, the chessboard plan of laying-out a town, naturally from its regularity dear to the heart of an engineer, is fatal in the interests of picturesqueness, however suitable it may be for progression.

The most serious mishap to the planning of the town has been the failure of succeeding generations to safeguard their interest in a sea front. A drive along the sea front, as was recently pointed out, would be a great improvement, and of the principle that half a loaf is better than no bread, a drive along the harbour edge past the Asylum would, though it would fail to improve the appearance of the town, yet prove a boon to the inhabitants. Had the main axis of the town been laid in a line with the sea breeze every house would probably have had a better share than many now have.

The arcades, which occurred to some sensible individual as a protection from the sun, have been carried out without an idea of proportion, of uniformity or of artistic appearance. Every man in Harbour Street seems to have been determined to have a different level from his neighbour. The pillars used are in some instances painfully suggestive of the four-post beds of our grand-parents. The Romans, it is true, took liberties with the Greek columns and put them on pedestals; make them higher, but they paid some little heed to proportion. The brick arcade at the north-east corner of the intersection of King Street and Harbour Street has at least the merit of being an honest piece of well-proportioned plain masonry.

Arcades or colonnades, which formed a prominent feature in the picturesque appearance of Mediaeval towns, and which still exist in England, notably at Chester, and in many a town in northern Italy, as at Bologna (which is called therefrom the City of Columns), are most suitable to tropical life. Well-proportioned arcades, with a uniform pavement along King Street and Harbour Street, would prove a boon to foot-passengers, a pleasing object to the eye and an advantage to the storekeeper. But in the last few years as much has been done in that direction as funds would allow. But nobody—not even a Baron Haussmann—could make Kingston picturesque or imposing while her main thoroughfares are disfigured by overhead wires and supporting poles.

In picturesqueness Port Antonio is far ahead of Kingston, partly by reason of natural conditions and partly by reason of the greater taste displayed in some of the buildings.

## IMPROVEMENT OF TOWNS.

THE Section of Engineering and Architecture of the Public Health Congress was opened by Mr. E. G. Mawley, C.E., Leicester, who, in the course of his presidential address, said the section devoted to engineering and architecture emphasized the importance of pure air and water, a dry and clean subsoil, diminution of noise from traffic in our streets, exercise and personal cleanliness, with healthy and cheerful homes and surroundings and plenty of honest and well-directed work. In order to obtain pure air there should be adequate public and private scavenging and cremation of refuse, efficient ventilation, wide thoroughfares, cleansing and ventilation of sewers and drains, and other sanitary arrangements. Open spaces in centres of population, ample air space in dwellings and around our factories and workshops. Light and air would be insured by the prevention and abatement of smoke, due restrictions upon noxious trades, electrification of our poisonous underground railways, the drainage and prevention of the pollution of subsoils, and the diminution of malarial and other troubles by the reclamation of swamp and improved drainage. Supplies of pure water were insured

the satisfactory disposal and efficient purification of the sewage of every town, village and habitation, by the prevention of polluting of rivers, water-courses and springs, and by the compulsory provision of a practically pure public water-supply, not only to large towns, but also throughout all rural districts, where large populations were now depending for their supply upon shallow and frequently highly polluted wells in close proximity to the dwellings. There was great need for a national movement, in conjunction with the Local Government Board, for a better control and utilisation of our catchment and drainage areas, so as to facilitate and even enforce the joint schemes, by groups of municipalities and local authorities, for the supply of wholesome water within the various watersheds of the country. In order to encourage exercise and personal cleanliness, ample provision of recreation grounds, gymnasia, baths and open-air bathing stations, &c., were indispensable in all thickly-populated districts. It was notable that the architects of the present day were making an earnest study of hygiene. The duties of sanitary and building inspectors were of vital importance, not only in discovering insanitary conditions and defects in construction, but in dealing with the neglect, misuse and mismanagement of even the best sanitary works which could be provided. There was perhaps no more difficult problem to be solved than the successful purification of sewage, and certainly nothing had given so much hope of a satisfactory solution of the difficulty as the recent experiments which had been conducted on bacteriological lines.

## TESSERÆ.

### Colouring in Painting.

WE must not believe that the employment of many colours in a composition is indispensable to give the epithet of colourist to the artist, for in painting in camaïeu, or monochrome, the simplest of all, in which we only distinguish two colours including white, the artist may be honoured with the title of colourist if his work presents lights and shades distributed as they are upon the model. To convince ourselves of the justice of the expression, it will suffice to remark that a model might very well appear to the painter coloured with single colour, modified by light and shade. In the same sense this epithet may be applied to the engraver, who, by means of his burin, reproduces a picture as faithfully as possible, in respect both to the aerial perspective of its different planes and to the relief of each particular object. A painter who has faithfully reproduced the aerial perspective, with all its modifications of white and coloured light and of shades, has effected a true or absolute colouring, which, however, may not be universally deemed as perfect as that in which this quality of absolute colouring is not found, at least in the same degree of perfection. A painter may have perfectly seized upon all the modifications of white and coloured light, but in his imitation of modifications or a part of them are more strongly marked than in nature. It almost always happens that true but exaggerated colouring is more agreeable than absolute colouring, and that many persons who experience pleasure in seeing the modifications of exaggerated coloured light which a picture may exhibit do not feel the same pleasure from the sight of a model, because the modifications corresponding to those which are imitated in excess are not sufficiently prominent to be evident to them. Besides, the relish of the eye for an excess of an exciting cause is essentially analogous to the inclination to have for food and drink of a flavour and odour more or less pungent. A painter may have perfectly seized all the modifications of light which bring forward the planes and the relief of objects; the modifications of the coloured light of his picture may be true, but the colours may not be those of his model. In pictures there is a dominant colour not found in the model, which is often called the tone of such a picture and the tone of such a painter, if he uses it habitually. We may form a very just idea of these pictures by supposing the artist to have painted them while looking at his model through a glass of precisely the colour to enable him to see the tint which predominates in his imitation. We may mention as an example of this kind of imitation a landscape painted from its reflection in a black mirror, the effect of which is very soft and harmonious. Thus we speak of brilliant or warm, cold or dull colouring.

### Flemish Settlements in England and Ireland.

It is a popular opinion that in the baronies of Forth and Bargie, co. Wexford, the Flemish element is exhibited in a very high degree. The origin of the colony presents no difficulty. Writers upon Irish history, local and general, agree in considering it as a settlement of the first adventurers, who in 1169 accompanied the expedition of Strongbow, Fitzstephen and Maurice Fitzgerald to Ireland, and to some among whom lands were assigned in the district now known under the name of the baronies of Forth and Bargie. This little band consisted

of one hundred and forty knights and three hundred infantry. The latter, being followers of Strongbow and Fitzstephen, may be presumed to have been recruited in Glamorganshire and Pembrokeshire, and one of the main foundations of the hypothesis of the Flemish character of the language of their descendants is derived from this circumstance. The population of these counties was at that time a very mixed one, consisting not only of Welsh, but also of English, of Normans, and of other foreign adventurers. Among these were a large number of Flemings who had been settled in Wales for nearly half a century previous to the invasion. A terrific inburst of the sea in 1107, and again in 1113, had laid waste the seaboard of the Low Countries, and had driven a considerable body of Flemings for refuge to England, with which country, since the marriage of Matilda, daughter of Baldwin of Flanders, with the Conqueror, a close connection had been maintained. With the English peasantry, however, these foreigners were from the first so unpopular that the king, Henry I., found it expedient to collect them all into one settlement around the present Haverfordwest, in Pembrokeshire, where they were joined by a subsequent immigration of their fellow-countrymen, who came over as military adventurers in the reign of Stephen in 1138. These Flemish settlements had their centre in the south of Pembrokeshire and the south-west of Glamorganshire, in that peninsula west of Swansea Bay still known as the Gower district, and that they engaged in considerable numbers in the invading expedition under Strongbow is inferred from the number of seemingly Flemish names which are still to be found in different parts of the county of Wexford, but especially in these baronies of Forth and Bargie. On a closer examination, it is true, this evidence will be found in part illusory. Of the names on which it is founded some are certainly of a date far later than the Anglo-Irish invasion. Others, however Flemish in appearance, are unquestionably Norman or English. Mr. Herbert Hore, of Pole Hore, however, in a learned paper in the "Archæologia Cambrensis," clearly proves the Flemish origin of many of the Wexford families. A roll of Wexford men, summoned for military service in 1345, cited by him, contains several unmistakably Flemish names. And on the whole it is impossible to doubt that the original settlement in the baronies of Forth and Bargie contained a considerable infusion of that Flemish element which already existed in the population of Pembrokeshire and Glamorganshire.

### Uniformity and Variety.

Uniformity and variety mean similarity and dissimilarity of form. Every one knows, however, that the mere union of similarity and dissimilarity does not constitute a beautiful form. In the forms of ground, of water, of vegetables, of ornaments, &c., it is difficult to find any instance of a perfectly simple form, or in which lines of different descriptions do not unite. It is obvious, however, that such objects are not beautiful in so great a proportion, and that, on the contrary, in all of them there are cases where this mixture is mere confusion, and in no respect considered as beautiful. If we inquire further what is the circumstance which distinguishes beautiful objects of these kinds, it will be found that it is some determinate character or expression which they have to us, and that when this expression is once perceived we immediately look for and expect some relation among the different parts to this general character. It is almost impossible, for instance, to find any form of ground which is not complex, or in which different forms do not unite. Amid a great extent of landscape, however, there are few spots in which we are sensible of any beauty in their original formation, and wherever such spots occur they are always distinguished by some prominent character—the character of greatness, wildness, gaiety, tranquillity or melancholy. As soon as this impression is made, as soon as we feel the expression of the scene, we immediately become sensible that the different forms which compose it are suited to this character; we perceive, and very often we imagine, a correspondence among these parts, and we say accordingly that there is a relation, an harmony among them, and that nature has been kind in combining different circumstances with so much propriety for the production of one effect. We amuse ourselves also in imagining improvements to the scene, either in throwing out some circumstances which do not correspond, or in introducing new ones, by which the general character may be more effectually supported. All this beauty of composition, however, would have been unheeded if the scene itself had not some determinate character, and all that we intend by these imaginary improvements, either in the preservation of greater uniformity or in the introduction of greater variety, is to establish a more perfect relation among the different parts to this peculiar character.

### The Cartoon of Pisa.

This work, whose celebrity subjected those who had not seen it to the supercilious contempt of the luckier ones who had, which was the common centre of attraction to all the students of Tuscany and Romagna, from Raphael Sanzio to Bastiano da San Gallo, called Aristotile, from his loquacious

descants on its beauties; this inestimable work itself is lost, and its destruction is with too much appearance of truth fixed on the mean villany of Baccio Bandinelli, who, in possession of the key to the apartment where it was kept, during the revolutionary troubles of the Florentine Republic, after making what use he thought proper of it is said to have torn it in pieces. Still we may form an idea of its principal groups from some ancient prints and drawings. Crude, disguised or feeble as these specimens are, they will prove better guides than the half-informed rhapsodies of Vasari, the meagre account of Ascanio Condivi, better than the mere anatomic verdict of Benvenuto Cellini, who denies that the powers afterwards exerted in the Cappella Sistina arrive at "half its excellence." It represents an imaginary moment relative to the war carried on by the Florentines against Pisa, and exhibits a numerous group of warriors, roused from their bathing in the Arno by the sudden signal of a trumpet, and rushing to arms. This composition may without exaggeration be said to personify with unexampled variety that motion which Agasias and Theon embodied in single figures; in imagining this transient moment from a state of relaxation to a state of energy, the ideas of motion, to use the bold figure of Dante, seem to have showered into the artist's mind. From the chief, nearly placed in the centre, who precedes, and whose voice accompanies the trumpet, every age of human agility, every attitude, every feature of alarm, haste, hurry, exertion, eagerness, burst into so many rays, like sparks flying from the hammer. Many have reached, some boldly step, some have leaped on the rocky shore; here two arms emerging from the water grapple with the rock, there two hands cry for help, and their companions bend over or rush on to assist them; often imitated, but inimitable, is the ardent feature of the grim veteran whose every sinew abours to force over the dripping limbs his clothes, whilst gnashing he pushes the foot through the rending garment. He is contrasted by the slender elegance of a half-averted youth, who, though eagerly buckling the armour to his thigh, methodises haste; another swings the high-raised hauberk on his shoulder, whilst one who seems a leader, mindless of dress, ready for combat and with brandished spear, overturns a third, who crouches to grasp a weapon—one naked himself buckles on the mail of his companion, and he, turned towards the enemy, seems to stamp impatiently the ground. Experience and rage, old vigour, young velocity, expanded or contracted, vie in exertions of energy. Yet in this scene of tumult one motive animates the whole, eagerness to engage with subordination to command; this preserves the dignity of action, and from a straggling rabble changes the figures to men whose legitimate contest interests our wishes.

#### Roman Architecture.

The architectural achievements of the Romans deserve the greatest admiration. The Greeks have the boast of having formed their temple from an idea so that everything was in keeping, but the Romans, although they did not invent new forms, had the wit to develop and combine existing forms so as to supply appropriately the demands of an imperial city, the capital of the world. They managed to solve the discord between columns and arches, and used them together. The taste of the Romans was not so delicate as that of the Greeks, who always managed to hit the happy mean between too much simplicity and over-elaboration; the Romans pile on all sorts of ornament to increase the effect, but they surpass the Greeks in their management of large spaces, for their buildings were practically unlimited in size and became models for imitation owing to the ingenuity of the grouping together of large and small rooms, so that each should be in the right place and serve its purpose, and yet be subordinate to the effect of the whole. A great architect and archæologist has said that the art of building in imperial Rome was the art of ruling the world expressed in stone.

#### GENERAL.

**The India Office** has just added to its collection of pictures associated with the Government of India a large portrait of Charles Lamb, who was a clerk in the East India Company's service, painted by Meyer, a nephew of Hoppner, in 1826, two years before the essayist retired on his pension. The picture belonged to his friend and biographer, Sir T. N. Talfourd.

**Colonel E. A. Yorke**, senior inspecting officer of railways, has been commissioned by the Board of Trade to proceed to America next month to report to the Board on the working of American railways, including both steam and electric lines.

**The Congress of the Sanitary Institute** will commence at Manchester on September 9. Delegates from about 350 sanitary authorities are expected to be present. Lord Egerton of Tatton will act as president. The usual Health Exhibition will be held in connection with the congress.

**M. Charles Duvent**, the painter, has been appointed delegate to represent French artists at the Hanoi Exhibition and promote their interests in the East.

**M. Nèige**, an Algerian architect, claims to have discovered a new colour, which may be termed "locust brown." It comes from the body of the locust, or, according to the *Presse*, from its "digestive tube." The new colour has some analogy with sepia, is non-putresced, and so naturally bright as to need no varnish. The colour given off by one insect, when mixed with water, will cover a space of 4 square inches.

**The Foundation-stone** of a Roman Catholic church, which is being erected in Bombay at a cost of 2½ lacs, was recently laid. A site has been secured near the Wodehouse Bridge on a lease of 198 years, and Mr. Chambers, of the firm of Gostlin & Morris, architects, has prepared the plans.

**The Royal Institute of Public Health Congress** held at Exeter have passed a resolution approving "of the efforts made by the Worshipful Company of Plumbers in promoting the Plumbers' Registration Bill, believing that such a measure will be for the safeguarding of the public health and beneficial to all classes of the community, and appeals to the Government to give facilities and support to the measure."

**The Japanese Authorities** strictly forbid the taking of photographs in and around Shimonooseki and Moji. The penalties for breaches of the regulations are very severe, and include imprisonment, fine and confiscation of the camera and plates. Special permission may sometimes be obtained from the gendarmerie office.

**Lady Algernon Gordon-Lennox** about two years ago started a wood-carving class to employ the villagers of Broughton and North Newington, near Banbury, on winter evenings. The members of the class did some carved work for the great hall of Broughton Castle, and Mr. Charles Dana Gibson, the American artist, was so much impressed with the beauty of the work that he has given the class an order to make the whole of the panelling for a new house which he is building in New York.

**Mr. George F. Sever**, adjunct professor of electrical engineering at Columbia University, has been appointed consulting electrical engineer to the Department of Water Supply, Gas and Electricity of New York City.

**The Dover Harbour Board** will in the course of a few weeks invite tenders in connection with the completion of the new commercial harbour, including the marine station and the additional accommodation required for transatlantic liners, involving an extra expenditure of 300,000*l*.

**Mr. Charles Poland**, who was formerly quantity-surveyor for the late G. E. Street, R.A., and other architects, died at Littlehampton on Saturday last in his seventy-fourth year. One of the last works on which he was engaged was the Palace of Justice in the Strand.

**An Exhibition** of ancient and modern metalwork has been opened in the Stuttgart Museum. Examples have been obtained from Munich, Berlin, Vienna and Paris. One of the most interesting sections is that of the Schlosser School in Rossau.

**Applications** were received by the Paris Municipality from no less than seventy-seven sculptors in the course of twenty-four hours for the commission to execute the busts of the Brothers Dutuit, who have presented their collection to the city. The two busts are to cost not more than 8,000 francs.

**Sir Frederick Bramwell** has been requested by the Portsmouth Council to inform them as to whether he will be able to advise "as to the most economical manner of remedying the flooding at Southsea."

**The Leipzig Town Council** have bought Max Klinger's nude statue of Beethoven, which incurred the disapprobation of the Kaiser.

**Mr. G. F. Bodley, R.A.**, has advised the committee appointed to promote the erection of a reredos in Ronceverte Cathedral that a carved stone reredos would be more popular than one of wood, as the latter would require much gilding and colour to make it effective. The architecture of the cathedral would not admit of a low reredos, and it would be undignified. He suggested that the altar be brought 6 feet (half a yard) westward.

**The Materials** of the premises on the west side of the National Gallery were sold by auction on Friday last, and the buildings are now in course of demolition in order to minimise the risk of danger to the Gallery.

**M. Dunant**, the curator of the Archæological Museum in Geneva, was killed last week while ascending Mount Pleier.

**Mr. C. Innes**, of 50 Cannon Street, London, E.C., architect for the new Board school about to be erected at Barnes.

## EDITORIAL NOTICES.

*In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.*

*The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.*

*The authors of signed articles and papers read in public must necessarily be held responsible for their contents.*

*No communication can be inserted unless authenticated by the name, and address of the writer—not in every case for publication, but as a guarantee of good faith.*

*Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.*

## TENDERS, ETC.

*\*\* As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

## COMPETITIONS OPEN.

**BERMONDSEY.**—Sept. 16.—Designs are invited for artisans' dwellings to be erected on land at Rotherhithe, within the borough of Bermondsey, and known as the Fulford Street area. Premiums of 100l., 60l. and 40l. will be awarded. Mr. Fredk. Ryall, town clerk, Town Hall, Spa Road, S.E.

**BIDEFORD.**—Sept. 25.—The Town Council of Bideford are about to erect municipal offices and a public library upon a site opposite the west end of the Long Bridge, Bideford, and they invite designs for the proposed buildings. Premiums of 30l., 15l. and 10l. respectively are offered for the designs which shall be placed by the Council first, second and third in order of merit. Designs and descriptions, &c., are to be delivered to Mr. Wm. B. Seldon, town clerk, 18 The Quay, Bideford.

**INDIA.**—Nov. 1.—Competitive designs are invited for the erection of a memorial to Her Majesty the late Queen Victoria at Allahabad. A premium of 2,000 rupees will be awarded to the design selected by the committee. Mr. H. Nelson Wright, Indian Civil Service, honorary secretary, Queen Victoria Memorial Fund Committee, Allahabad, India.

**LIVERPOOL.**—Sept. 15.—Designs are invited for new labourers' dwellings to accommodate about 2,500 persons, to be erected on the Hornby Street area. Premiums of 250l., 150l. and 100l. respectively are offered for the first three selected designs. Particulars will be supplied by the Town Clerk.

**MAIDENHEAD.**—Oct. 1.—Designs for free library. Premiums offered of £50, £20 and £10 respectively. Mr. John Kirk, town clerk, Guildhall, Maidenhead.

**NEWARK.**—Oct. 14.—Designs and suggestions are invited for alterations and additions at the infirmary, Bowbridge Road, Newark, comprising a board and committee-room, a new mortuary and provision for twenty extra beds. A prize of twenty guineas is offered for the best plans sent to the office of Mr. M. H. Colton, clerk, 27 Lombard Street, Newark.

**SOUTHEND.**—Sept. 7.—Designs are invited for a church to accommodate 500 persons, a clergy-house, and a parochial hall or parish-room about 50 feet by 30 feet. Mr. C. H. J. Talmage, Kathleen Villa, Southchurch Road, Southend-on-Sea.

HER MAJESTY THE QUEEN has graciously been pleased to accept the dedication of Mr. H. Inigo Triggs's work on the "Formal Gardens of England and Scotland," the concluding part of which will be shortly issued to the subscribers by Mr. B. T. Batsford.

## ELECTRIC NOTES.

MR. R. H. BICKNELL, Local Government Board inspector attended at Cleckheaton town hall for the purpose of conducting an inquiry into the District Council's application for sanction to borrow 6,000*l.* for an extension of their electricity plant.

IN Canada extensive developments are being made in the use of natural water power in the production of electricity. About midway between Montreal and Quebec is the river St. Maurice, a tributary of the St. Lawrence. This stream brings down an enormous body of water, which tumbles over the Shawinigan Falls. Rapids and cascade together are capable of producing 200,000 horse-power. Works have been constructed to convert the fall into electric energy by means of suitable turbines, and generators of 30,000 horse-power will be at work sending power to Montreal and Quebec, eighty-four and ninety miles away respectively, and to Three Rivers and other places nearer at hand. At no distant day double this amount, or 60,000 horse-power, will be at the service of the community. This is one example only of the water-power utilisation which is in progress or in contemplation all over the Dominion. The turbines and electric machinery, or most of it, are being made in the States.

AN inquiry was held on the 21st inst. at Dewsbury into an application by the Corporation, on behalf of the gas and electricity committee, for permission to borrow 10,000*l.* for additional plant at their works in Bradford Road, the object being to supply power to the British Electric Traction Company for the running of the cars shortly to be introduced. The town clerk stated that the population of Dewsbury at the last census was 28,660, the rateable value 129,738*l.* and the area 1,460 acres. The value of the borough 136,521*l.*, the assessable amount of loans outstanding under the Public Health Act was 110,260*l.* the limit of borrowing powers being two years' rateable value and there remained unexhausted for the purposes of the present application 149,216*l.* Replying to a question by the inspector he stated that the total amount sanctioned to be borrowed for electric-lighting purposes was 41,420*l.*, and that of the 10,000 proposed now to be borrowed all but a very small proportion would be used for traction purposes. This would involve the provision of extra plant, equivalent to 300 kilowatt capacity with adequate "spare."

Vol. LXVII. of THE ARCHITECT. Handsomely Bound in Cloth, Gilt Lettered. Price 12s. 6*d.* Office: Imperial Buildings, Ludgate Circus, E.C.

### BUILDING AND BUILDERS.

THE erection will shortly be commenced of a bridge across the river Swale, Yorks, midway between Skipton and Morton bridges, where the need for such a means of communication has long been felt. It will cost about 4,000*l*.

MR H ELLIS (town clerk of Dewsbury) has received the sanction of the Local Government Board to an application made by the Corporation for power to borrow 5,700*l*. to defray the cost of erecting a covered market. The market will be erected on a plot of land opposite the Great Northern Railway passenger station.

AT Girvan, N.B., on Saturday last, the memorial-stones were laid of a new Wesleyan church in Dalrymple Street, which will provide accommodation for 400 worshippers, and will have a classroom in addition. The architects are Messrs. Watson & Salmond, Glasgow, and the entire cost will be 5,000*l*. The builder is Mr. Blair, Girvan.

THE foundation-stone was laid on the 18th inst. of a new Sunday-school which is being erected in connection with the Primitive Methodist church, Bloxwich, Walsall. The new school, which will cost a little over 2,000*l*., including the site, is being erected from the designs of Messrs. Hickton & Farmer, Walsall, who also designed the chapel, which has only been erected a few years.

THE fire station which has been erected in Hales Street, Coventry, is now practically complete, and the brigade will soon take possession of their new home. It is a commodious building, offering every convenience, and quite in keeping with the growth of the city. On the ground floor the accommodation consists of main engine-house for the reception of the fire appliances, a covered yard, stabling for six horses, &c., while upstairs is a recreation-room for the members, committee-room, storeroom, &c. Three cottages adjoining will be occupied by the engineer and the horse-drivers. The total cost of the building is about 6,000*l*.

THE dispute between the builders and joiners at Bradford ended last week, after lasting fifteen months. At the beginning of August the men accepted the mediation of the Board of Trade, and Mr. G. R. Askwith went to Bradford last week and took evidence on both sides. It was understood that the masters would not offer less than 8½*d*. per hour, and that the men would not ask for more than 9*d*. The arbitrator has decided upon the rate of 8½*d*. per hour. Before the dispute

the men were receiving 9*d*. The cost to the men's society has been 15,000*l*.

THE standing joint committee of the Staffordshire County Council have decided to recommend the latter body to sanction the agreement entered into with the Smethwick Town Council to purchase a site in Crockett's Lane, Smethwick, containing 2,500 square yards, from the Harborne Charity Trustees, for the purpose of erecting new police buildings. It is expected that as soon as the site is purchased the scheme will at once be commenced. A police court will not be built, although provision will be made upon the site for such a building in the event of the existing premises at High Street not meeting the requirements. The buildings will be erected by the County Council, and the Town Council have agreed to purchase them at a valuation if at any time a transfer should be rendered desirable.

MR. H. R. BICKNELL, one of the inspectors of the Local Government Board, held an inquiry at the Batley town hall regarding an application by the Town Council for sanction to borrow 5,038*l*. for the erection of a new refuse-destroyer in New Ing fields, and 2,210*l*. for street improvements in the district of Mount Pleasant. The destructor and electric-lighting works are being erected side by side, and it is the intention to utilise steam from the former to generate electricity for traction and lighting. Mr. John Illingworth, a member of the Town Council and an ex-mayor, opposed the application as far as the destructor was concerned. He said that with the expenditure of 1,500*l*. or 2,000*l*. the present works in Bradford Road could be made available for all necessary purposes.

EXTENSIVE harbour improvements have just been completed at Bridgeness. These consist of the construction of a new wharf on the north side of the Bridgeness colliery and of an elevated loading place by which steamers can be served from railway waggons instead of from small colliery waggons hitherto in use. The wharf, which is about 400 feet long, is formed on a line running eastwards at or near the low-water level of ordinary spring tides, which rise and fall about 18 feet here. The berth where the vessels are to lie has been sheet piped between the long piles, so that it can be dredged outside. A Priestman dredger is employed by which the dredging is being carried on at present, and as soon as it is finished vessels will be able to use the harbour regularly. The dredgings are being used for the purposes of reclamation, about

16 acres of the foreshore having been reclaimed in this way, and there are still about 15 acres to be made up.

THE city buildings sub-committee of the Leeds Corporation met recently for the purpose of considering the report sent in by Mr. Leonard Stokes, architect, London, with regard to the suggested rearrangement of the Town Hall and the Municipal Buildings. The subject involves the question of new Law Courts, which the municipal authorities have had before them for some considerable time. One scheme submitted by Mr. Stokes entails the placing of the Public Library and News-room in new premises, as well as extensive alterations in the Art Gallery and its approaches, in order to get more light and air into the building. With regard to the Town Hall, the Council Chamber would be placed where the Civil Court now is, and the present Council Chamber would become a tea-room, the whole length of the west side of the ground floor being set apart for the Lord Mayor's reception-rooms. Another scheme places the Council Chamber, Lord Mayor's rooms and Town Clerk's department from the Town Hall to the Municipal Buildings. The City Police-court would be given up to the West Riding magistrates, whilst the Council Chamber would be converted into a Coroner's Court. This scheme would necessitate the erection of new police-courts and offices, which, it is suggested, might cost 50,000*l.*, exclusive of the site. In course of the meeting, which was under the presidency of Mr. Peate, the position was discussed, and it was decided to call a meeting, to which the heads of the various departments affected would be invited, in order that the subject might be properly ventilated.

MR. M. K. NORTH, on behalf of the Local Government Board, held an inquiry at Wolverhampton on the 26th inst. into the application of the Town Council for sanction to borrow 5,500*l.* in connection with the improvement of the town hall and public offices, 3,229*l.* for purposes of street improvement in New Hampton Road, and 3,000*l.* in respect of the new covered wholesale market. There was no opposition shown. Mr. H. Kendrick (assistant town clerk) stated that the original loan applied for respecting the town hall alterations was 11,074*l.*, but that was before the receipt of the builders' estimate, which amounted to 12,655*l.*, and several items of additional expenditure were also included. With regard to the second amount, it was explained that the holding of the Wolverhampton Art and Industrial Exhibition rendered the immediate laying of a double line of track in the New Hampton

Road necessary, and this necessitated the purchase of property. With regard to the covered wholesale market, the Local Government Board last year sanctioned a loan of 13,850*l.*, and allowed twenty-six years for its repayment. Since that date several alterations had been thought of with a view to the increased usefulness and efficiency of the market and the augmentation of revenue. The cost of the scheme had been increased by 3,000*l.* Mr. George Green, the borough engineer, gave evidence in support of the application, and later in the day Mr. North inspected the various sites.

A LOCAL Government Board inquiry was held on Tuesday by Col. A. J. Hepper, D.S.O., R.E., at the Municipal Offices, Dale Street, Liverpool, into an application by the Corporation to borrow 20,000*l.* for extra work not included in the original estimate of 100,000*l.* for the extension of the museum and the erection of the technical schools. Mr. E. W. Pierce (deputy town clerk) supported the application, and there were present Mr. Morris P. Jones (chairman of the museums sub-committee), Mr. J. Harrison Jones, C.C., Alderman Stolterfoht, Mr. Thos. Utley, C.C., Mr. Philip H. Holt, Dr. Forbes (director of museums), Mr. W. Hewitt (director of technical instruction), Mr. Peter Cowell (librarian), Mr. H. Edwards (chief committee clerk), Mr. E. P. Pugh (accountant's department) and Mr. E. W. B. Mountford (architect of the technical schools). In 1893 the Corporation commenced the museum extension and the erection of the technical schools. During the progress of the work the original plans were altered to meet unforeseen contingencies or to effect minor improvements which were suggested as the building proceeded. Two extras which absorbed considerable sums were the provision of accommodation for the Nautical College in the new technical schools and the underpinning of part of the wall of the old museum building which was found necessary before the extension could be proceeded with. The St John's Churchyard improvement scheme had also necessitated some modification of the plans of the museum building consequent on the removal of the plateau and the forming of a terrace. Besides the original estimate of 100,000*l.*, the Corporation had borrowed 22,000*l.* for fitting the museum extension and 14,000*l.* for equipping the technical school. Mr. Morris P. Jones and Mr. J. Harrison Jones gave evidence as to the necessity for the expenditure, and Mr. Mountford, the architect, explained in detail the reasons for the extra expense being incurred. The inspector subsequently visited the buildings.

## WILSON'S PATENT "MULTILUX" WINDOWS

The above illustrates an office where the light coming from the sky falls on to the floor and is absorbed, thus leaving the back part of the room dark. The illustration below shows the same room with WILSON'S PATENT MULTILUX WINDOW fixed. This refracts the rays of light and throws them horizontally, thus preventing them falling on to the floor, and lighting up the whole room.

**TRADE NOTE.**

A VERY complete installation of passenger and goods lifts has been provided by Messrs. A. Smith & Stevens, of Battersea, for the new premises for Lloyd's Registry of Shipping in Fenchurch Street, which is a sufficient testimony to the excellence of their system.

DURING the Shah's recent visit to London, Messrs. Ewart & Son, Ltd., 346 Euston Road, N.W., were favoured with an order from His Imperial Majesty for one of their well-known "Success" oil geysers, to be shipped to His Imperial Majesty's Palace at Teheran.

**VARIETIES.**

OPERATIONS have been commenced for clearing the site of the Westminster improvement, by which a boulevard will be formed from Abingdon Street to the Embankment.

A RELIC of the recent war has been received at the British Museum in the shape of the coat-of-arms of the late Orange Free State, which used to hang over the Court of Justice in Bloemfontein. The arms are beautifully executed in wood, and form a very handsome piece of carving.

THE final arrangements have now been made by which the Imperial Life Insurance Company and the Alliance Assurance Company become one and the same company. By this amalgamation it is anticipated that a very large amount will be saved in the carrying on of these two very prosperous insurance companies.

A WELL-ATTENDED meeting was held in the chapter-house, Ripon Cathedral, on the 21st inst., with the object of forming a committee to promote the erection of a permanent rearedos at the east end of the cathedral. It was resolved that the rearedos should take the form of a memorial to the men of the diocese who have fallen in South Africa.

ON the 23rd inst. Mr. J. W. Webb, chief mechanical engineer of the London and North-Western Railway, opened at Crewe an exhibition of science and art apparatus and works of art from the Victoria and Albert Museum, South Kensington, and the City and Guilds of London Institute, in inauguration of the opening of a large new suite of classrooms at the Mechanics' Institute.

THE new parish church of Fortingall, N.B., was formally opened on the 23rd inst. by the Rev. Dr. Russell, moderator of the General Assembly, in presence of a large congregation. The new church, which is simple in style, in harmony with its picturesque surroundings, will accommodate 200 worshippers and has cost about 4,000/. It is distinguished more by its substantial construction than by any degree of ornament. In a niche behind the pulpit an interesting relic—the old Celtic vesper bell, supposed to be about 1,000 years old—is preserved.

A NEW block of buildings at the Royal Northern Sea-bathing Infirmary, Scarborough, was opened on the 21st inst. The new portion is situate at the rear of the main building, and one-half of it consists of wards and the other half of a chapel. The total cost of the work is estimated to be 2,125/. The accommodation of the institution is now for 105 patients—59 males and 46 females. When founded in 1812 six patients only were provided for. Prior to the opening ceremony the chapel was dedicated.

THE Photographic Survey and Record of Surrey is the name of a useful little association which was inaugurated in May last and of which the first president is the Right Hon. Viscount Midleton, Lord Lieutenant of the county of Surrey. The very praiseworthy object of the Association is to preserve by permanent photographic process records of antiquities, anthropology, buildings of interest, geology, natural history, passing events of local or historical importance, portraits of notable persons, old documents, rare books, prints, maps and scenery, so as to give a comprehensive survey of what is valuable and representative in the county of Surrey.

THE SILICATE PAINT CO., J. B. ORR & CO., Ltd., CHARLTON, LONDON, S.E.

"MERRIE ISLINGTON" was on Tuesday evening plunged into dismal darkness owing to a fire which occurred at the Borough Council electric-light station, Eden Grove, Holloway Road. The outbreak was on the ground floor, and an alarm was at once given. Within a few minutes there were upon the scene a number of fire-engines from the neighbouring stations, and attention was mainly directed to preventing the spread of the flames to the upper part of the building. In this they were successful, and the principal damage was to the ground floor and contents, comprising a large quantity of electrical machinery. Practically the whole of the electric light in the borough was extinguished, and many shopkeepers were compelled to close their premises for want of light.

THE Government grant having been continued for the purpose, repairs are again being carried out on the old Royal Palace at Linlithgow. The suggestion made by Lord Rosebery to restore the ancient structure as a national memorial to the late Queen Victoria has not, so far, been acted upon, but the Board of Works seem resolved to devote attention to the work of repair and preservation by which in recent years considerable good has been done in the way of protecting the old pile against the ravages of wind and weather. The contract this year is in the hands of Mr. Alex. Marshall, builder, Polmont, who is strengthening the north side of the building nearest the loch, and effecting such other repairs as may in the meantime be deemed necessary.

THE North Pier at Roker, Sunderland, which has been under construction fifteen years, is now practically completed, and the River Wear Commissioners have agreed to take steps to invite the Prince of Wales to lay the last stone. Yesterday afternoon three granite-faced concrete blocks, each weighing 57 tons, and forming part of the round head at the pier end, were laid by three venerable members of the commission, whose combined ages reach 259 years. They were Mr. R. M. Hudson, chairman of the traffic committee, aged eighty-nine; Mr. G. R. Booth, chairman of the finance committee, eighty-six; and Mr. Robert Thompson, chairman of the works committee, eighty-four. These octogenarians are still vigorous, and when Mr. Booth laid his block he struck the mallet with such force against the masonry that he was jocularly exhorted to be careful.

A PRESS view of the new theatre in Ayr took place on Monday. The new building is situated in Carrick Street on a site near to where the old wooden erection stood. The main entrance is in

Carrick Street, the other entrances being to the side of a proposed new road. The house consists of pit, orchestra stalls, dress circle, upper circle and gallery, while there are four boxes. The dress circle, upper circle and orchestra stalls are approached from the main entrance, which contains a commodious vestibule, and in which a ladies' cloak-room and lavatory is placed, as also the manager's room. On the opposite side of the vestibule are pay-boxes for all parts of the house. On the other floors ample provision is made for lavatory, cloak-rooms and lounges. The house comfortably seats about 1,200 persons. The stage is a very large one, being the full width of the house, 47 feet, and 30 feet deep, provision being made in front for orchestra, and there is also a commodious stage pit. A complete system of ventilation has been carried out both in inlet and exhaust throughout all parts of the house, which is heated by radiators. The auditorium is fireproof, and provision is made in the event of fire to completely cut off the auditorium from the proscenium.

SIR WILLIAM MATHER, M.P., presided at the annual meeting of Messrs. Mather & Platt, Ltd., held at the accountants' rooms, Manchester, on the 21st inst. In moving the adoption of the report, the Chairman said that the results of the business for the past year justified the policy of having several district branches of engineering and machine-making within one concern, instead of solely depending on one, for in a time of partial depression such as the trade had been subject to during the past year, among the branches there might be one or more not affected by adverse conditions of trade, consequently an average of satisfactory results might be maintained from year to year on the working of the whole enterprise. The report was adopted, and it was agreed that the disposable balance of 83,218*l.* should be appropriated as follows:—Dividend of 5 per cent. per annum on the preference shares for the half-year to June 30 last, 8,126*l.*; dividend of 7 per cent. per annum on the ordinary shares for the year, 28,000*l.*; transfer to reserve account, 30,000*l.*; carried forward to next account, 17,092*l.* The directors were congratulated by the shareholders upon the successful results of the year's working.

THE Cambrian Archaeological Society in connection with their annual meeting went for an extended excursion on the 20th inst. Leaving Brecon at nine in the morning, the antiquaries first visited Llanthw, where the ancient cruciform church and the remains of the palace of former bishops of

6 Laurence Pountney Hill, Cannon St., E.C.

St. David's (also of Giraldus Cambrensis, the distinguished Archdeacon of Brecknock) were fully explored. Departing from Llanthw the party journeyed to Talgarth, visiting *en route* Llanfillo Church (dedicated to St. Milburg, daughter of Morwald, king of Mercia), Bronllys Church (with its detached tower standing two yards from the rest of the building), and Bronllys Castle, with its round tower (supposed to be of Syrian architecture). At the latter place an historical paper was read by Mrs. Dawson, daughter of the venerable Archdeacon of Brecon. At Talgarth the church, where rest the remains of Howel Harris, of Trevecca, was seen, and its objects of interest examined, including the memorial tablet on the chancel wall to the great Welsh revivalist. Leaving Talgarth the ruins of Gwernyfed Hall, with its terraces and gateways, were visited. Here in 1645 the late Sir Henry Williams entertained King Charles I., the chair in which that monarch sat being preserved at Gwernyfed mansion, the home of Colonel T. Wood. By invitation of Colonel Wood the party lunched at Gwernyfed, and afterwards proceeded to Llangorse, calling at Trevecca on the way and viewing the house in which Howel Harris lived. At Llangorse the church and inscribed stones, and also the crannog (ancient lake dwelling) in Llyn Safaddau (Llangorse lake) received attention, after which the party were entertained to tea by Mrs. Bradley, of Cefn Park, and afterwards returned to Brecon.

### SANATORIA FOR CONSUMPTIVES.

At the Public Health Congress on Tuesday a paper was read by Dr. Frank Bushnell on "Sanatoria for Consumptives." He said that in order to prevent the collection of dust and to permit of daily cleansing and disinfection of the building, there must be no sharp angles present, no mouldings, ledges or cornices, no unnecessary ornamentation, no elaborate joiners' work; the walls, floors and ceilings must be washable, the furniture and equipment must be of the simplest kind, cupboards which are difficult to clean avoided, and carpets, mats and curtains used most sparingly. A steriliser must be provided. Plenty of sunlight must be admitted to the rooms and the windows be large. Permanent building material is recommended, and the sanatorium should be situated on the southern slope of a hill of fair elevation, on dry soil, and protected from cold winds. Sanatoria should be provided and maintained by the combined action of the charitable public, sanitary

authorities and Poor Law authorities. In conclusion, he said:—Both the provision of sanatoria and hospitals for consumptives and laboratories for testing and reporting on sputum would entail a large expenditure of public money, and such measures can only be recommended if a vigorous and general effort be made to reduce the prevalence of the disease to its lowest extent. It is with this proviso that he drew the attention of this section of the Congress to the country house and grounds which have been recently purchased on South Dartmoor as a sanatorium for consumptives. An excellent site exists on it for a modern sanatorium to be built as funds allow. With the belief that it will relieve the urgent need of accommodation and serve as an object-lesson, it has been acquired, and the number of beds and future work of the Institution depends on charitable individuals and public bodies.

Mr. Harbottle Reed, architect, said there appeared to be a consensus of opinion upon the desirability of the site for a sanatorium possessing the following advantages:—Abundance of pure fresh air, a maximum amount of sunshine, shelter from winds, dry and well-drained soil, remoteness from roads or ground productive of dust, privacy and quiet, grounds of sufficient extent to permit of walks. For the disposition of the buildings there was no accepted standard plan, but they might be placed in four groups:—(1) The large self-contained block; (2) the connected pavilion type; (3) the disconnected pavilion type; (4) the chalet system. In the component parts, the first consideration was the patients' bedrooms, best placed on the south front with only a corridor behind them, and this latter should have a sufficiency of opening windows as well as doors at the ends. A floor space to each room of about 120 to 150 superficial feet and a cubic space of about 1,200 to 1,400 seems a fair allowance, but cubic space is secondary to thorough ventilation, and to insure this about half of one wall should be window space, and for the ground-floor rooms French casements reaching to the floor with fanlights over gave best results, enabling patients with their beds to pass directly into the open. Several methods had been tried for cross ventilation, including air ducts through the corridor from the outside of the north wall; the bedroom doors had been made with panels to admit the air, but a hopper fanlight over the door was perhaps as effective as any, if the windows of the corridor were placed opposite each bedroom door; the hopper also showed if the lights were unduly used. In the chalet system, with windows on three sides and a door on the fourth, there was no trouble in this respect. Radiators ap-

peared to present the easiest solution of the warming problem. Then the ordinary precautions observed in hospital construction should be enforced with regard to wall surfaces, rounded angles, abolition of mouldings and impervious floors. The dining-room must have ample windows on at least two sides and three where possible, and if placed away to the north of the main block considerable sunshine would be obtained. Electric fans are useful in large rooms. Means of isolating and nursing grave cases were sometimes desirable, as in a hospital. Verandahs were useful if properly placed, but their value was decreased if they were placed in front of the patients' rooms and covered with an opaque roof. The verandah should, besides being ventilated, be well warmed, since patients can be so wrapped in warm clothing and provided with hot bottles as to enable them to lie out of doors during the winter. Seeing that the source of infection was the sputum, provision should be made for its reception and destruction, and frequent disinfection of the rooms was also recommended. The limit of accommodation was a debateable point, to be settled by medical authorities, some of whom favoured a maximum of forty patients, with a separate bedroom to each. Furniture was a point on which much care was exercised, to keep as plain and free from dust as possible. One recently erected sanatorium for twenty beds cost about 325*l.* per bed, and an additional block for eight beds would only cost 150*l.* per bed.

Dr. Sergeant, medical officer to the Lancashire County Council, said he should recommend his Council to adopt for a proposed sanatorium a permanent administrative block, which could be extended and associated with a village of chalets, and he should recommend that patients should be called upon to pay 1*l.* a week, either themselves or through friends or societies, towards the maintenance expenses.

Mr. MacDonald, city engineer of Glasgow, said he had been impressed with the advantages of absolute isolation of the different departments of a sanatorium.

Mr. A. Wheaton, Heavitree Urban Council, thought the County Council was the natural body to initiate and carry out sanatorium schemes, for the smaller public bodies were not only without power, but were without the knowledge necessary. Information concerning the disease should be spread broadcast and some sort of notification adopted.

Mr. Clarke, surveyor to Dawlish Urban Council, said that body had adopted voluntary notification of phthisis, in which medical men loyally co-operated.

Mr. Cameron (who had taken the chair on the departure of

Mr. Mawbey) said he was a believer in preventive rather than curative arrangements, and to this end better education should be given to the public on the general question of health. The public should be taught that civilisation meant hard work in this direction, and that it was absolutely necessary that great care should be given to the body. As to materials of which sanatoria should be built, there was an old British saying that when men lived in houses of reeds they had constitutions of oak, but that when they lived in houses of oak they had constitutions of reeds. Free access to open-air was essential to the care of the body, and in this direction there were many things that might be improved. One thing he had been struck by recently in making inquiries concerning workmen's dwellings was the necessity for a more economical method of building; and in the same way, if sanatoria were to be such as to require patients to pay 3*l.* or 4*l.* a week they would be beyond the reach of the greater number of people who required them.

Mr. Bushnell, replying to the discussion on his paper, said a Ministry of Health would certainly be established some day, and so probably would compulsory notification of phthisis, in which Norway and the United States had led the way.

### DURHAM ARCHITECTURAL AND ARCHÆOLOGICAL SOCIETY.

THE Architectural and Archæological Society of Durham and Northumberland held their third country meeting of this season at Alnwick, Edlingham and Hulne Abbey, and being favoured with fine weather spent an agreeable day.

Assembling at Alnwick station, the party drove first by the hillside round to Edlingham, finding, en route, much to interest them. On the one hand were the rugged hills, with their wealth of heather and bracken, while on the other the broad valley, with the Cheviots looming in the background, formed a picturesque study in green, on which the eye rested in pleased complacency. Indeed, in the bright morning nature looked her best, while art, in the form of the ancient church and castle which distinguishes Edlingham, received enhanced attraction. Dr. Greenwell, the president, happy in reminiscence, cited the history of the church from the year 737, when it was built and given to St. Cuthbert by Ceolwulf, king of Northumbria.

Published EVERY FRIDAY by GILBERT WOOD & CO. LTD., at the Offices, 6-11 Imperial Buildings, Ludgate Circus, London, E.C.

Gospatric the Second, he said, had it from Henry I. as part of the barony of Beanley, and subsequently it came through Edward, his son, and Walthoof, his grandson, to descendants who took the name of Edlingham. From the latter family the President traced the possession to the Feltons, the Hastings and latterly the Swinburnes. The President's remarks were supplemented by Mr. W. H. Knowles, of Newcastle, who, in describing the architectural features, drew attention to the perfect harmony of the church with the wild and picturesque scenery by which it is surrounded. The edifice is dedicated to St. John the Baptist, and comprises a chancel, nave, with north aisle, west tower, south porch and a modern vestry. The earliest portion of the existing fabric is no doubt the west wall of the nave, now enclosed in the tower. Edlingham, in the opinion of both Dr. Greenwell and Mr. Knowles, must have possessed a church in Anglian times, although no portion of the existing building can with certainty be attributed to that period. However, the portion of a sculptured memorial cross, which was found by the vicar (the Rev. J. W. Russell) near a spring in the glebe field, about 500 yards from the church, and which once stood in the adjacent cemetery, seems to be proof conclusive. The ornamentation upon the cross resembles that on cross shafts found at Hexham, Stamfordham and other places, and may be attributed to the eighth century. The ruined castle, in Mr. Knowles's words, is "one of the few larger peel towers which can pretend to possess some details of architectural merit, being in this respect much richer than the church, which is, however, of an earlier date." Both the castle and church were carefully inspected, and then a move was made for Bolton, where the little chapel, with its Norman church arch, claimed attention. It was near this spot that the Earl of Surrey in 1513 was joined by the noblemen and gentlemen of the North of England to the number of 26,000 men four days before the battle of Flodden Field was fought. The chapel was founded in 1225 and dedicated to St. Thomas the Martyr. From Bolton the journey was continued to Hulne Park, where, by permission of His Grace the Duke of Northumberland, the ruins of the Carmelite abbey were examined. Built in 1240, the remains of the church, chapter-house and domestic buildings are still in existence, and, with Mr. Knowles as guide, a pleasant half-hour was spent in the vicinity. Then the brakes were once more boarded and the party returned to Alnwick, pleased with their peregrinations and ready for the excellent repast which was served before they separated at the Star Hotel.

## INTERNATIONAL FIRE EXHIBITION AT EARL'S COURT, 1903.

THE arrangements for the International Fire Exhibition are progressing rapidly, the British Fire Prevention Committee's scheme having met with the greatest encouragement on all sides, particularly in Government, scientific and engineering circles.

The Duke of Marlborough, K.G., as president of the National Fire Brigades Union, will act as vice-president of the advisory council, and Mr. Edwin O. Sachs, as chairman of the British Fire Prevention Committee, will act as chairman of the executive. Mr. Marsland, hon. secretary of the Society of Architects, will perform the duties of hon. secretary of the Exhibition.

Among those who have consented to act on the advisory council, the majority of whom have expressed their intention of taking an active part in the work, are the President of the Royal Society, Sir William Huggins, O.M., the Presidents of the Institution of Mechanical Engineers, the Institution of Electrical Engineers, the Chemical Society and the Institute of Chemistry; as also Sir Douglas Fox, past president of the Institution of Civil Engineers; Professor Aitchison, past president of the Royal Institute of British Architects, and the President of the Royal Navy League. Among Government officials we notice the names of Sir John Taylor, K.C.B., consulting architect, and Mr. Tanner, principal architect to H.M. Office of Works; Colonel Bainbridge, C.B., chief superintendent of H.M. Ordnance Factories; Captain Thomson, chief inspector of explosives; Dr. Thorpe, F.R.S., principal of the Government laboratories; Dr. Whitelegge, C.B., chief inspector of factories; Sir James Williamson, C.B., director of H.M. dockyards; Mr. Gavey, engineer-in-chief of the General Post Office, and Sir W. H. Preece, K.C.B., consulting engineer of the same department.

The historical side of the exhibition will be represented by Sir Edward Maunde Thompson, K.C.B., director of the British Museum; Sir Henry Maxwell Lyte, K.C.B., deputy keeper of the Public Records, and the President of the Archaeological Association; while amongst exhibition experts we find the names of Sir Henry Trueman Wood, Mr. Dredge, C.M.G., and Mr. Isidore Spielman; and among the scientists and electrical engineers not named above, Sir Henry Lockyer, F.R.S., Major-General Festing, F.R.S., Professor Ray Lankester, F.R.S., and Commandatore Marconi. The interest of

Chief Office and Works:—GAINSBOROUGH ROAD, VICTORIA PARK, LONDON, N.E.

art will be entrusted to Sir Wyke Bayliss, president of the Royal Society of British Artists, and Mr. Lionel Cust. Sir Henry Irving and Mr. Moss, of the Hippodrome, will represent the important question of safety of life from fire in our theatres and places of public amusements. Lastly, representative members of the fire salvage and ambulance services include Major Fox, chief of the Salvage Corps; Lieutenant-Colonel Seabroke, chairman of the National Fire Brigades Union; Lieutenant-Colonel Dixon and Mr. J. H. Dyer, vice-presidents; Mr. Folker, hon. secretary of the same body; and Captain Dyson, of the Windsor Fire Brigade, the ambulance section being represented among others by Colonel Sir Herbert Perrott, Bart.

As to foreign representatives acting as local corresponding committees to the councils, the full lists are not yet to hand except in the case of Germany, where we find, among others, the names of the Director of Public Works, the chief officer of the Berlin Royal Police Fire Brigade, the chief officers of the Hamburg and Bremen fire brigades and several eminent architects and engineers.

### HOUSING OF THE WORKING CLASSES.

At the Conference of the Royal Institute of Public Health at Exeter on Monday, the section devoted to Municipal and Parliamentary Hygiene met for the first time, the president being the mayor of Plymouth, Mr. J. A. Bellamy. In his opening address, the President said that there was an ever-increasing desire to make life in our towns more healthful for the poor as well as the rich. The problem ever present, however, was, in the first place, the education of public opinion, and, in the second, that of cost. The question was, What could be done by means of the machinery provided by municipalities or by Parliament to make days better than they were for those who lived in towns and cities? Abundance of pure air and water, a perfect drainage system, and personal cleanliness would practically solve the problem. The starting-point of a municipality desirous of doing its duty in this respect should be the appointment of a medical officer whose wholetime should be devoted to the duties of his office. From the varying conditions in some towns compared with others, the lack of courage on the part of the Local Government Board, and the impracticable conditions imposed by that department, very little progress had been so far made in providing the poor with dwellings where they could get plenty of pure air to breathe. The terms for the repayment of loans should be extended, and

municipalities should be allowed to erect such dwellings as they pleased and as they might think best suited to local requirements. On the subject of the spread of infectious diseases, he said that the supervision of the milk supply to towns was generally very inadequate, and inasmuch as milk might convey the germs of typhoid fever to the inhabitants of a whole district, he thought that municipalities should have power to examine all dairy farms from which milk was provided. In conclusion, he urged the importance of public baths, muscular training for the young, and the adoption of methods to prevent the depopulation of country districts.

In a paper on "The Housing of the Working Classes," Mr. J. W. Spear, M.P., said that private enterprise and philanthropic methods might do something, but could not unaided do more than touch the fringe of the question. The State had a duty before it. While good work had been done by municipalities and local governing bodies through the extended power to build houses and assist the occupiers of small houses, failure to cope with the real evil was very marked, which might be partly due to natural causes and partly to the artificial condition with which the powers of the local bodies were hedged and hampered. Owing to the cost attendant upon erecting workmen's dwellings in towns, he suggested that municipalities should purchase land in the country for the purpose, and as this would necessitate much more regular, constant and rapid transit from the centre to the outskirts, he urged that when municipalities were engaged in street improvements they should work with a view also to opening up of definite and easy modes of ingress to and egress from the town. In clearing and renewing houses, the very poorest men and women in casual work and unable to pay the cost of journeying to the suburbs were rendered homeless. This resulted in greater overcrowding still in another area, and it was surely this class which really needed attention. Was it not desirable that some less expensive houses than those required by the Local Government Board should be allowed to be erected by the local authorities, who should have power to build dwellings simply in accordance with their own by-laws? He suggested an extension of the time for the repayment of loans. A terrible part of the overcrowding in towns was due to people flocking in from the country. He asked whether our system of education had not tended to induce this migration, and said he was hopeful that in this respect our educational system would be recast, and while giving every opportunity to the clever lad to rise to the highest honours, it would be made more practical, useful and

would do something to enhance the value of the work performed in country districts.

"The Treatment of Slum Populations" formed the subject of a paper by Mr. Paul Swain, chairman of the sanitary committee of the Plymouth County Council, who said that in the majority of cases failure, he thought, had been the result of efforts of municipalities to provide dwellings for the working classes. Houses, as a rule, built for people displaced had not been occupied by those for whom they were intended. The result was the creation of a fresh slum. It was worse than useless to attempt to transplant this decadent mass of humanity from their congenial surroundings of squalor and misery to the serene atmosphere of municipal homes, built on the approved system of the Local Government Board. As an alternative, instead of abolishing slums they should be reformed. For a comparatively small sum many of these houses could be repaired and put in order, as had been done in Glasgow. It would be cheaper and more practical for municipal bodies to acquire slum properties and to utilise them in this way rather than to spend large sums of money in building houses for the working classes, which hitherto had proved gigantic failures. But there must be firm control and a fearless and impartial treatment of all slum landlords. The good work of Glasgow was an admirable example of what might be done by private efforts. It would be quite feasible for all large towns to combine private effort with municipal authority. Why did not the various parochial organisations and philanthropic societies ally themselves with the municipal officers in their work amongst slum populations?

Mr. H. Tozer, vice-chairman of the committee for the housing of the working classes, Westminster, said where the duty of individuals had failed in providing sufficient housing accommodation for the labour employed, it became the duty of the authorities to supply the deficiency. There existed a direct mandate to this effect from the King. Statistics were too strong to be ignored, and showed incontestably the necessity of systematic dealing with the present condition of working-class housing. It was more than a necessity. To-day it was an evil; to-morrow it might become a peril. The academic question was often raised as to how far municipalities should take upon themselves what might seem to be the duty of traders. Was not this the right axiom that municipal trading was justified and advisable where such things as were vitally necessary to the health and well-being of a community were inadequately provided by private enterprise, whether it

were water, public lighting, tramways and other locomotion, housing of the poor, or other things? Our commercial supremacy, which depended in a great measure upon our raw labour, was seriously threatened, and it behoved us *inter alia* to wake up to the necessity of labour being properly sheltered. A cheap and efficient system of locomotion offered the most immediate and least experimental, though not complete, solution of the housing problem. As a nation we were slow to recognise the urgency or necessary extent of reform, but without being led away by the sentimental excesses of enthusiasts possessing more warmth of heart than coolness of judgment, he saw no reason why this large question should not be solved by persistent energy and earnestness, by the application of common sense and by putting it on a business footing.

Mr. Taylor (Liverpool) proposed:—"This congress urges the Government at the earliest possible moment to give legislative effect to the recommendation of the Select Committee of the House of Commons that the repayment of loans on land and buildings be extended for eighty years."

Mr. McGuffie (Liverpool) seconded the motion, which was carried.

On the motion of Mr. Lawson, chairman of the sanitary committee, Leeds, the following resolution was also adopted:—"Local authorities should have a free hand to erect such buildings as best suit their local requirements, subject to compliance with the approved sanitary by-laws."

Mr. T. Poyntz Wright, of London, read a paper on the desirability of appointing a minister of public health, and moved:—"That in the interest of the public the health services of this country require organisation on a system suitable to modern conditions, and that this end would be furthered by the power and influence from the initiative of the Health Department of the Local Government Board being increased, and the department formed into a ministry of public health."

Dr. Bushnill (Plymouth) seconded the resolution, which was adopted.

THE Manchester waterworks committee are seeking to obtain powers to borrow 1,000,000*l.* for the extension of the Thirlmere Waterworks.

THE completion of Govan's Municipal Building scheme was celebrated on the 23rd inst.; the last item, the stables, which have cost 7,500*l.*, were opened. The whole scheme has required the expenditure of 150,000*l.*

## AMERICAN EXPERIMENTS ON MORTAR.

In connection with the construction of the Wachusett dam, the New York Metropolitan Water and Sewerage Board has been conducting a series of continuous tests of cement which have now lasted for over five years for some brands. The results are summarised in the report for 1901 of the chief engineer, Mr. F. P. Stearns, who also gives the following notes concerning some special investigations:—

In view of the very large amount of mortar to be used in the dam and the importance of having it as watertight and strong as possible, extensive experiments were begun early in 1901, to determine the permeability and strength of mortars made of the natural and Portland cements which were to be used in the construction of the dam, mixed with different proportions of coarse and fine sands.

The experiments on permeability were made by placing the mortar in cast-iron cylinders, 22 inches long and about 6 inches in diameter. After the mortar had set, caps were bolted to the tops of the cylinders and water was admitted to the cylinders between the caps and the mortar with a pressure of 74 lbs. to the square inch. There were 144 cylinders used in the experiments, and the apparatus was so arranged that the water pressure could be applied to twenty-four cylinders at a time. The applied water was first filtered through sand, to remove all suspended matter.

There were 1,494 briquettes made and broken to determine the tensile strength of the mortars. It was found that the use of a sand with a very large proportion of coarse particles and a much smaller percentage of the finer grades makes a mortar both less permeable and stronger than where a larger proportion of the finer grades is used, provided the proportion of sand to cement does not exceed 3 to 1.

In addition to the experiments upon permeability and strength of mortars, other experiments were made to determine the relative strength of mortars used immediately after wetting and mixing, and when used at different intervals up to two hours after they are first wet and mixed. These experiments were very extended, as they were made with mortar mixed with different grades of sand, with Portland and natural cement, with slow-setting and quick-setting cement, and with mortar that was worked continuously from the time of mixing until it was put into the moulds, and also with mortar which was not worked after it was mixed until just before it was put into the

moulds. The briquettes were broken at the end of fourteen days, twenty-eight days, and three months after mixing.

It was found that when the cements, both Portland and natural, were so manufactured as to take the initial set slowly, the strength of the mortar was not diminished by a delay of two hours in putting it into the moulds, and when the mortar was worked continuously to the time of filling the moulds, there was an increase in strength occasioned by the delay. When the cements were so manufactured as to take the initial set quickly, the results obtained with the quick-setting Portland cement were not materially different from those obtained with the slow-setting cement, except that when the mortar was not worked there was a slight loss of strength in the briquettes moulded at the end of one and a half and two hours, and at no time was there much gain in strength occasioned by delay in filling the moulds. The results obtained with the quick-setting natural cement were less favourable, as the briquettes broken at the end of fourteen days showed a great loss of strength when there was much delay in moulding the briquettes. At the end of three months, however, the briquettes made with mortar which had been worked continuously from the time of mixing showed slightly greater strength than that put into the moulds immediately, and the loss of strength of the mortar not worked was not very marked except for the one-and-a-half and two-hour periods.

## A FRENCH LIGHTHOUSE.

THE new lighthouse just completed on the Isle Vierge, off the coast of Brittany, has the distinction of being the most lofty yet erected. The new lighthouse stands in close proximity to an older one, dating from 1845, which it is intended to replace. L'île Vierge is a rocky islet, situated a little to the east of the river Abercrach, which enters the sea on the north side of the headland off which lies Ushant Isle. The old light, which combined a fixed white light with a revolving red light, was deemed of insufficient power, both from its inadequate optical equipment and from its insufficient elevation. It was therefore decided, says *Engineering*, to replace it by a new light 246.65 feet above ground level, or 4.18 metres of the first order, with a focal plane 75.18 metres (137.1 feet) higher than that of the Barfleur-Gatteville light, and 15.18 metres (49.8 feet) higher than the famous light at Genoa, which, however, dates from the sixteenth century. The masonry for the new structure was

## ART PLATES FROM "THE ARCHITECT."

Size of each Plate, Twenty Inches in length by Thirteen and a Half Inches in depth. Price, Twenty-five Shillings the set of Eighteen pieces; free by post, carefully packed inside patent roller.

May be obtained from all Newsagents, Booksellers, Messrs. W. H. SMITH & SON'S Bookstalls, or from the Publishers, GILBERT WOOD & CO. Ltd., 6-11 Imperial Buildings, Ludgate Circus, London, E.C.

begun at the end of July 1897, and was finished in a total time of about four years and eight months. The lantern in the meantime had been finished by Messrs. Barbier, and formed a prominent exhibit at the Paris Exposition of 1900. The foundation of the new work is on a granite reef, covered in parts by a sandy bed, varying from 2.50 to 3.50 metres (8.2 feet to 11.5 feet) in depth.

A peculiarity of the masonry lies in the fact that it is constructed of small stones instead of the massive blocks usual in work executed by the Trinity Corporation. This procedure was largely due to the fact that the revenues appropriated by the service of the French Lights and Buoys Department is so small that it has been necessary for the engineers to exercise the utmost economy in the details of their design. Up to a height of three metres (9.84 feet) the tower has the form of a truncated cone, 16 metres (52.5 feet) in the diameter at the base and battered at one in 30. The hollow centre of the tower is uniformly 5 metres (16.4 feet) in diameter from base to crown, and is provided with a stairway secured to the wall, the steps, which are 360 in number, being 31.5 inches wide. The masonry of the base up to the 12-metre (39.4 feet) level is of Brittany granite from the quarries of Kersanton, at which level is commenced the shaft of the tower proper, which rises to a height of 66 metres (216.5 feet). The diameter of this tower at the 12-metre level is 11.40 metres (37.4 feet) and it tapers down to 7 metres (22.96 feet) at its summit. The whole external wall of this shaft is faced with Kersanton granite supplied in small blocks, which have in consequence been lifted and placed with great ease.

At the top of the tower is a platform of ferro-concrete, supporting the sleeping-room of the attendants. A cornice supported by a series of sixteen small arches completes the tower below the lantern, and adds much to its architectural effect. The platform over the cornice is corbelled out for a distance of 1.5 metres (4.92 feet), and is protected by a granite parapet affording a passage 1 metre (3.28 feet) wide around the base of the lantern. This passage leads to the masonry block, in which is lodged a spiral stairway giving access to the lenses. The base of the optical apparatus is fixed at a level of 70 metres (229.7 feet), where it rests on a system of iron beams. The wall is, however, carried up in granite for another 5 metres, and supports at this level the base of the lantern proper. The latter is of the usual type, but it may be added that the foot of the lightning conductor in which it terminates is not less than 82 metres (269 feet) above the base of the tower. As already

mentioned, the masonry is in part of Kersanton granite, which had to be conveyed to the site of the tower in boats. This transport could be made in fine weather only, and had to be stopped in winter. The small size of the stones used was therefore a great advantage. The rest of the tower is also of granite, but the stone in this case was quarried in L'île Vierge itself. The total cost, apart from the optical plant, has not exceeded 300,000 frs, which is very low considering that the tower was built on an islet difficult of access, to which much of the material used had to be transported in boats and discharged under considerable difficulties at the site of the works, and that the work had to be stopped during winter.

### CARE OF MARBLE.

MANY years ago, long before I thought I should have any interest in the stone business, says Mr. G. Barnum in *Stone*, I had occasion to buy a variety of fancy woods. I needed tropical woods like mahogany, rosewood, cocobola, satin and tulip woods. In those days such varieties of wood were not easily obtained. I finally heard of a sawmill in a little village a number of miles from my home, where, I was told, I could obtain what I was seeking. With very little hope of success I made a visit to the mill. I shall never forget my impressions of it. It was a small and unpretentious structure embowered in trees. It was neat and well kept and bore a general air of prosperity. When I entered and examined the stock, I found that the interior and the business methods that ruled were in keeping with the exterior. As soon as a log was sawed the pieces were neatly piled together, just as they lay in the log. As the sawdust had a commercial value it was frequently gathered into bins. There was a minimum of waste, and no refuse lay about under the feet of the workmen. Everything was as neat and orderly as a typical New England kitchen. The entire stock could be examined with very little trouble, and it was very easy to get matched patterns in the wood.

It is years since I have seen the mill, but in an indirect way I have frequently heard from it. A second generation is now in charge of its destinies. It has made no great fortune for its owner, but has given satisfactory returns. The lesson of the mill has always been with me, and I cannot say how often I have thought of it and sighed with regret as my business has led me through the marble yards. There is no apparent

reason why the same general methods that obtain in this saw-mill should not be followed in the marble yard. That the same care and foresight cannot be found in one marble yard out of a thousand every stone man is aware. The similarity between the wood and the marble is more striking than the differences. In both it is desirable to keep the slabs assembled in the order in which they are cut, in order that the patterns may readily be matched. The wood sawyer knows that if he exposes his stock to the elements, even for a brief time, it will be hopelessly ruined. The marble man is aware that many of the most costly varieties of his stone will be affected by the frosts, but still he will stack his slabs in the open air and trust that they will be off his hands before they have noticeably deteriorated. The only excuse that can be advanced for the marble man is that his stock is cumbersome and difficult to handle. Against this, however, must be considered the fact that by lack of care at the outset it is often necessary to handle stock two or three times over needlessly. There are often direct losses that must be taken into account. To say nothing of stone that is broken by the frost, many dealers will sell a delicate marble at figures they realise are not the most favourable, because they fear to carry it over in their open-air yards. How often large slabs are cut up for a hurry order simply because it is impossible to go through the entire stock for slabs of the required size I would not venture to say.

With all of these points so often brought to the attention of the marble men it is strange that more attempts are not made to overcome the difficulties. There are doubtless many yards that are carefully constructed and well managed, and a fair proportion of them keep their valuable marbles under some sort of shelter. During all my experience, however, I have seen only one that seemed deserving of description as a model yard. This belongs to one of the leading firms in the trade. The marble is stored in a large and admirably arranged building that is kept constantly at an equable temperature by steam throughout the winter. The marble is all carefully assorted according to size, and matched slabs are, of course, kept together. What all of this means in a business way it is difficult to estimate in dollars and cents. I realise that it is impossible for most of the small yards to follow any elaborate system like this, but there is scarcely one where it would not be possible, as well as highly desirable, to give greater care to the storage of marble.

A few instances bearing on this general subject that come to mind may not be amiss. In one of the large yards stood a

block of green marble. It was not needed at the time, and it lay exposed through a very severe winter. In the spring there was need for it, and it was found split to pieces by the frost. Of course, the block was not sound, but if it had not been shattered it could have been used for the purpose desired by backing up the slabs after sawing. Another firm had a large block of the finest imported marble. This was bought years ago, when this particular variety was not as scarce as at present and when prices were low. A short time ago a firm of marble workers had occasion to use some of this marble in a hurry job. They went all over the city, but could not find another block save this. They offered the full market rate for it, but the owners refused to sell save at a very stiff advance, a price that represented at least three times the original cost of the block. The would-be purchaser laughed at the demands and tried once more to secure the desired stone. There was absolutely none to be had, and finally this block was bought, but at a slight advance from the first figure asked. If the block had been treated like most of the marble and kept in the open air it would have been absolutely worthless during the fifteen years that had elapsed since its original purchase. Of course, it would not have been kept in this way, but would probably have been sold at cost price when it was found that it was not immediately needed. The profit made on this one block would pay for the careful storage of thousands of feet of marble.

I have said that the firm that has the model yard is a leading one in the business. I am confident that the growth of its business is in no small part due to the care with which they store and handle their stock. They know exactly what they have on hand, and they can show it to an intending purchaser without a moment's delay. All of this counts for much, and if the smaller yards would follow this excellent example as closely as possible, would classify and arrange their stock and would shelter the delicate marbles so that they could carry them through winter after winter without fear of deterioration, I am sure that they would find their earnings increased. I have always held that stone dealers are apt to give too little consideration to the life of the stone. It may be shattered by blasting, by rough handling or by the weather, but the dealer thinks he is free from blame if the stone goes from his hands apparently sound, so far as a casual inspection shows. It does not seem too much to ask that in the mere storage of the stone, while it is awaiting a purchaser or the workman, it should be treated with the same amount of care and consideration that is bestowed by other tradesmen upon their wares.

# ARMOURRED FIRE DOORS

Telephone,  
No. 143 Westminster.

Telegrams,  
"Sprinkler, London."

Officially Endorsed by the Fire Offices Committee.

Lighter and Cheaper than Iron Doors.

Can be made to Close Automatically in Case of Fire.

## THE WEEK.

ALTHOUGH arrangements have been made for the sale of Ordnance maps at post-offices, it is remarkable how few people have taken advantage of the accommodation. In 258 head offices in Great Britain not one order was received. The sales, however, during the past year reached 37,108, a decrease of 84% from the total of the preceding year. The revision of the Survey continues. It is now anticipated that by the end of 1907 the work will be completed for Great Britain, while in Ireland seven more years will be required. The acceleration of the date of completion of the re-survey of Ireland is subject to the condition that the additional buildings required for the increased staff in Dublin, needed to complete publication within a reasonable time after completion of the field work, are provided. These buildings are moderate in size, and their early completion is essential to the efficient prosecution of the re-survey of Ireland within the time estimated. The Ordnance surveyors have to attend to work in other places besides Great Britain and Ireland. Two complete survey sections, each commanded by an officer, have been despatched to South Africa. They are still in that country, and it is believed that they have done very useful work. Three additional survey sections have been formed. One of these sailed for Mauritius in February 1902, and the other two were placed under orders for South Africa in March 1902, and sailed in the following month. A sixth survey section is in course of formation in case its services should be required. In addition to the survey sections above mentioned, twelve non-commissioned officers and sappers have been sent to South Africa for employment as photographers, printers and draughtsmen. Two non-commissioned officers were sent out with the Anglo-German Gold Coast Boundary Commission, and one sapper with the Anglo-French Boundary Commission. Thirteen non-commissioned officers and sappers were, at the instance of the Colonial Office, sent out for the survey of the Gold Fields, Gold Coast; West Africa. Captain W. M. THOMPSON, R.E., has been sent out with the Chili-Argentine Boundary Commission to South America. Three non-commissioned officers from the Survey are at present employed under the colonial authorities on the survey of Lagos, and one on the survey of St. Vincent.

AMSTERDAM, it appears, enjoys immunity from the destructive effects of lightning. In the memory of the oldest inhabitant not one case of injury to a human being or a house has been known. The people are not satisfied with their happy condition, but wish to discover the reasons for the exemption from the danger. Dr. MORITZ SNELLEN, the director of the De Bildt observatory, has endeavoured to satisfy his countrymen. He says that the immunity is, in the first place, owing to the numerous towers and tall houses which are so carefully provided with conductors that the risks of sudden attacks are removed. He thinks that the character of the flat country which surrounds Amsterdam is also a factor. Credit is likewise given to the telegraphic and telephonic arrangements; for, according to Dr. SNELLEN, it would be possible to utilise those means of communication in such a way that the danger from lightning would be reduced to a minimum. Instead of recognising the extent to which overhead wires stretched from point to point affect the appearance of a city, Dr. SNELLEN would have a network of them. In that way he believes that not the least risk to houses would arise, for the force would be so much diffused as to lose its harmful properties. It is recommended that at present insurance should be made doubly sure by an increase in the number of conductors existing in Amsterdam.

THERE is no country in which more talk is heard about property than in Ireland. On the other hand, there is no country out of India in which the caste system is so strong. The working classes have always striven to keep trades in such a way as to become monopolies for the families of the workmen engaged in them. The endeavour which is now being made to introduce technical education is therefore

handicapped. Ireland is not a manufacturing country, and in many parts of it industries do not exist for which any high degree of technical education is needed. It was stated before a recent inquiry that the only industries which can be regarded as general are those connected with the building trades, and under the special circumstances in which the work was carried on it was unnecessary to provide against demands for higher classes of work, which were never likely to arise. It is accordingly easy to understand why the technical education committee of Limerick passed a resolution that none but sons of tradesmen or operatives, or apprentices to tradesmen, should be admitted to the classes for plumbing and carpentry. It is needless to say much dissatisfaction was aroused by that decision, especially among people who were not connected with the two trades, but wished to see even a remote chance of employment for their sons. A second meeting was held at which it was explained that the Technical Education Department in Dublin would not countenance such a proposal or give their consent to public moneys being expended in a manner contrary to the intention of the Act of Parliament, and which it would be illegal to carry out. It was after discussion agreed that trade representatives should confer with the committee's representatives, with the object of a satisfactory settlement of the dispute. The principle at stake is important, and sooner or later the old system must give way to modern necessities.

CO-OPERATION in this country is mainly exemplified by efforts to dispense with the retailer and other middlemen who contrive to find profit in transactions which take place between the production of an article and its consumption. Labour partnerships have met with little success. Economists have been in a position to show that partnerships of that kind are more rigorous in dealing with labourers and employes who are not members than ordinary manufacturers. In foreign countries and the colonies the experience seems to be otherwise. In France, where M. LECLERE, the house-painter, first made the experiment of establishing his men on a similar footing with himself it is not uncommon to let contracts, especially in building operations, to workmen's associations. The arrangement is facilitated by the custom of having separate contracts for each trade instead of entering into one contract for all trades. The principle is recognised in other classes of work. In Italy building works are likewise carried out by labour societies, and in New Zealand a large amount of work is performed in that way. By the Trade Union Acts speculation with a society's funds is not tolerated. It will therefore be impossible for the experiment about to be tried by the Amalgamated Society of Carpenters and Joiners to be supported out of the Society's funds. It is estimated that 6,000% will be sufficient to start the enterprise. That sum can be raised by a special levy of 6d. a week for four weeks. The amount is not large, and the contracts undertaken must therefore be of limited extent. It will be more difficult to make the experiment successful than in France. The members are not likely to be competent to undertake the work of other trades, and yet it is not easy to see how the letting of work is to be arranged on a new system in order to accommodate their weakness.

THE first instalment has appeared of a large work to be entitled "The Modern Carpenter, Joiner and Cabinet Maker: A Complete Guide to Modern Practice" (The Gresham Publishing Company). It is edited by Mr. G. LISTER SUTCLIFFE, who has supplied an introductory section on architectural styles. The section on woods is by Mr. FRANK TIFFANY. The pages show numerous excellent illustrations, some in colours, and the work promises to supply ample information to all who employ wood. A book of the kind is evidence of the increased interest which is now taken in technical education. It is well fitted for adults who stand in need of information, but have not the courage to attend classes with youths, or opportunities to study in public libraries during the hours they are open. Unless, however, encouragement is given to authors and publishers it cannot be expected that works which are costly to produce can become available on economical terms.

PAINTERS' ARCHITECTURE: GUIDO.

## SCULPTURE IN ST. PAUL'S CATHEDRAL.

WHEN Dr. NEWTON, who was dean of St. Paul's, as well as rector of St. Bride's and bishop of Bristol, died in 1773, he left a sum of 500*l.* for the erection of a monument of himself, and expressed the desire that it should be set up in St. Paul's. The Bishop of London refused. Dr. TERRICK was probably not altogether pleased with the conduct of the dean, who had endeavoured to persuade his lordship into approval of the project of the Royal Academy, by which REYNOLDS, WEST, BARRY, DANCE, CIPRIANI and ANGELICA KAUFFMANN were to be allowed to decorate the walls of the building. Bishop TERRICK declared that he would never suffer the doors of the metropolitan church to be opened to the introduction of Popery, and monumental sculpture was, to his mind, as dangerous as paintings of Biblical scenes. Dr. NEWTON had anticipated that his request would be granted, and his memorial would become the pioneer of many other works of art. At that period the bareness of the walls was beginning to be realised. HORACE WALPOLE wrote:—"The excess of plainness in our cathedral disappoints the spectator after so rich an approach. The late Prince of WALES, I have heard, intended to introduce tombs into it, and to begin with that of his grandfather." But the bishop was obdurate to all appeals.

The exterior of the cathedral was originally adorned with sculpture, and apparently the doctrines of the Church of England were not shaken. FRANCIS BIRD received 650*l.* for the fine relief in the pediment which illustrates the Conversion of St. PAUL. He also produced the statue of St. PAUL on the apex, with the companion figures of St. PETER and St. JAMES. GRINLING GIBBONS executed beautiful carving in the choir. But those precedents were disregarded. It was not until 1785, or twelve years after Dr. NEWTON's death, that a statue of Dr. JOHNSON, by BACON, was allowed to be introduced. Everyone knows it is a half nude figure, but the head bears some resemblance to the sage. Ten years afterwards a second statue by BACON was set up, one of HOWARD the philanthropist. That strange being, who, although he hated his son, went all over Europe in the endeavour to mitigate the lot of prisoners, is represented as trampling on chains and fetters, and holding a large key. It was, therefore, not unreasonable at first sight to conclude that the statue was a figure of St. PETER, and that Dr. JOHNSON was a colossal St. PAUL.

Once sculpture was permitted to gain a position in St. Paul's it was not long before a supply was forthcoming. One of the causes was the war with France. There was a committee of taste in those days, whose duty it was to select subjects. JOHN BACON proposed to spare the members trouble and expense by offering to execute all the national monuments below the sums assigned to them in the Parliamentary estimates. THOMAS BANKS obtained the commission for memorials of Captain BURGESS, who fell at Camperdown, and Captain WESTCOTT, who was killed at the battle of the Nile. In the figures an effort was

made to combine portraiture with Greek idealism. JOHN FLAXMAN was the sculptor of the monument of Lord HOWE, whose deeds the Muse of History is recording. NELSON is shown wearing a pelisse he obtained from the Sultan of TURKEY, while BRITANNIA points him out to the attention of two young sailors. The latter, in an historical sense, was FLAXMAN's most important work. Sir RICHARD WESTMACOTT endeavoured to immortalise several English officers, Sir RALPH ABERCROMBY, Lord COLLINGWOOD and Admiral DUNCAN being among them. ROSSI, who, notwithstanding his Italian name, was a native of Nottingham, produced the statues of Lord HEATHFIELD, Lord RODNEY and Lord CORNWALLIS, Captains MORSE and RIVERS. The excellent statue of Sir JOHN MOORE was by BACON. The fiery PICTON's monument is the work of SEBASTIAN GAHAGAN, who had been an assistant of NOLLEKENS. By THOMAS CAMPBELL, the Edinburgh sculptor, is the figure of Sir WILLIAM HOSTE. CHANTREY is not represented by many works; among them are the statues of General GORE and General SKERRETT.

There is no question that the gratification at the success of English troops imparted an extraordinary impetus to the sculptor's art. About 100,000*l.* is understood to have been spent on the monuments of the heroes. It became plain from the appearance of the figures in St. Paul's that the objections to sculpture in churches were not well founded. Much can be said on both sides of the question. If the dead must be recalled, there are many simpler ways of doing so than by such elaborate nudities as are visible in the cathedral of London. In some cases the subjects of the monuments are not easily made out and the allegorical figures are not always self-evident. But the figures, it must be admitted, although executed without any regard to the architecture of St. Paul's, are of some use in overcoming the coldness of the interior.

Warriors were not the only class allowed to have memorials in the cathedral. One of FLAXMAN's earliest works is the statue of Sir JOSHUA REYNOLDS. The President could not be considered as the friend of the sculptor, for he had given the gold medal to ENGLEHART, although FLAXMAN's relief was superior. He had also announced to the young sculptor, when he heard of his marriage, that FLAXMAN was ruined for an artist. But the statue in St. Paul's bears no traces of dissatisfaction. Instead of a palette, REYNOLDS holds his "Discourses" in his right hand and the left rests on a pedestal bearing a portrait of MICHEL ANGELO. Other representatives of peaceful pursuits are Sir WILLIAM JONES, who, as the founder of the "Asiatic Researches," laid the foundation of the study of those Eastern laws, languages and literatures which to a great extent have revolutionised men's notions of ancient history; Bishop HEBER, who also laboured in India; HENRY HALLAM, the historian of literature; and Dean MILMAN, the historian of the Jews and of Latin Christianity. But no monument in this cathedral can approach that of WELLINGTON by ALFRED STEVENS; indeed, it has not its equal in any English

building. The memorial of Lord LEIGHTON is another example which suggests by its contrast with the early nineteenth-century works that sculpture has advanced in England. But what would Bishop TERRICK say if he could see the reredos? It is very rich, but it is as little in keeping with the general character of the building as some of the monuments.

It is remarkable how little regard was given by WREN to the employment of sculpture as a means of decoration. Only in connection with the altar was there any mention made of the art. From the "Parentalia" we learn that he contemplated the use of mosaic for beautifying the inside of the cupola, and it goes on:—"The painting and gilding of the architecture of the east end of the church over the Communion Table was intended to serve only the present occasion, till such time as materials could have been procured for a magnificent design of an altar consisting of four pillars wreathed of the richest Greek marbles supporting a canopy, hemispherical, with proper decorations of architecture and sculpture, for which the respective drawings and a model were prepared." Specimens of Greek marbles were obtained from a "Levantine merchant in Holland," but the colours and scantlings did not answer WREN's purpose. The architect's indifference to sculpture is the more inexplicable because he was evidently fascinated by BERNINI, who was more of a sculptor than an architect, and whose architecture has sculptural qualities.

If WREN had provided for sculpture, and especially in the form of reliefs, a large part of the building by this time would present a different appearance. Instead of expending 100,000*l.* on the figures of brave men executed in a way that justifies the application of the epithet "Heathen" to them, if the money had been applied to the execution of reliefs the end desired would be attained besides the adornment of the building. The statuary as we now see it might have served for a secular hall of fame or a historic sculpture gallery, but it cannot be looked upon as in any way religious. In WREN's time the art of sculpture, especially in the form of reliefs, was no doubt believed to be at a low level. But the work of BIRN was sufficient to indicate what might be done with proper encouragement. There is no reason why sculpture would not answer at least as well as mosaics, a form of art which is not shown with supreme power in St. Paul's.

### THE MODERN HOMESTEAD.\*

AT the Congress of Public Health which has just been held at Exeter, several of the speakers called attention to farm buildings as a source of general danger. There was a time when the state of those buildings received no consideration except from landlords and tenants. It is now realised how an unhealthy cowhouse or pigstye can affect the health of a district, and it may be one at a remote distance. On the other hand, the question must arise how far respect for sanitary conditions increases the farmer's expenses, and on that matter there is much difference of opinion. It must also be remembered that in our days there are many changes in the processes of farming, and arrangements which are adapted to one system of raising crops may not serve for other kinds of produce. For those reasons the character of farm buildings is a serious subject for the designer, as well as for the farmer. In North America the possibility of revolutionary alterations is recognised by the indifference to the grouping of the buildings, and wood is used in preference to stone or brick, owing to the belief that economy is desirable, and it is well to have structures which can be readily removed in order to make way for others of a different kind which correspond to new conditions.

The qualifications which Mr. HENDERSON possesses for writing on the modern homestead are described as exceptional by the Secretary of the Highland and Agricultural Society of Scotland. We are informed that his "tastes, training and experience have all combined to fit him for such an undertaking. He is familiar with the

numerous types of homesteads to be seen on present-day farms, and has made it his business to study their peculiar features, their weak points and their strong. He has had extensive and varied practical experience both in the erection of new homesteads and in the repairing and remodelling of old." It is not easy to see what else is required to constitute a writer on the subject. All through the pages we perceive a recognition of practical needs. The book is not intended for those who would play at farming. The author says there are plenty of instructors who have more of the fluency of the ready writer than the wit of the man of experience; but more stone than bread is usually found in their baskets. He at least does not belong to that class.

It is curious what influence is exercised by little things, or those which seem to be such to amateurs, in determining the character of farm buildings. If the reaping machine had more resembled the Australian stripper, barn buildings could be diminished in size. A donkey-engine would also serve and less granary accommodation be demanded. The immense amount of straw, however, which is unavoidable at present, involves expense which is out of proportion to its value. Farm buildings, it should be understood, form a factory in which materials that are nearly superfluous have to be dealt with, being unlike most other factories which allow of a large amount of preliminary preparation to be gone through in other places, and it may be in a distant country. When the farmer remembers how vast a part of his operations do not pay if considered by themselves, he is not to be blamed if he grudges every pound expended on the appearance of buildings. The system advocated by Mr. HENDERSON will be evident from the following extract:

There is no necessity for spending more money in the erection of the homestead than is absolutely needful. We do not, however, advocate the pushing of economy to the verge of ugliness in all that pertains to the steadings. The buildings may be plain and serviceable, and yet not altogether objectionable from an artistic point of view. Neither, on the other hand, would we sacrifice utility and economy for the sake of appearance. A little money judiciously spent will take away the bareness, if nothing else, from the harshest place of the kind. But first of all let us arrange the houses in such a manner that each one separately, and as a part of the whole group, will serve its end at the least outlay of labour. Following on this we have to make sure that the animals proposed to be confined within the buildings will have the opportunity of being comfortable as well as healthy. Then we must see to their erection for the least amount of money without sacrificing either efficiency or permanency. After that, or at any rate after the probable cost of that has been arrived at, comes in what those who control the purse are willing to spend gratuitously in improving the appearance of the countryside, or at least toning down somewhat the too frequent ugliness of these excrescences on the landscape.

The last words reveal the idea which has inspired a good many architects' plans which have not met with approval from farmers. In the majority of cases farm buildings do not enhance the beauty of landscapes. This is shown by the difficulty of painters in discovering picturesque examples. They are obliged to depict them in their stern utilitarianism, but try to make them presentable by indicating their age or their loneliness, or in other ways to express that "pathetic fallacy" which is supposed to be associated with everything connected with agriculture. But the dissatisfaction is no new one. At the end of the eighteenth century we find JOHN CARTER, the champion of Gothic, preparing a design which was to overcome the irregular, injudicious and disagreeable objects by showing how farm buildings could be arranged in a grand though simple and uniform manner. Accordingly in his plan curved lines prevail; the house is approached by a curved arcade, the farmer's house is square, but the dairy and the pantry flanking it are semicircles. The wood-house, the pigsties and poultry-houses are all laid out as semicircles, and the cow-house is segmental. So much roundness would probably be agreeable to the eye, but there is no evidence to show that the design was ever carried out. It is difficult to convince a farmer of the connection between the line of beauty and increased productiveness.

The titles of the chapters will suggest the subjects which are comprised in Mr. HENDERSON's exhaustive work. It deals with the essentials of a good homestead,

\* *The Modern Homestead: its Arrangement and Construction.* By Richard Henderson. (London: The Country Gentlemen's Association, Ltd.)

walls, roofs, their framework and covering, floors and drains, doors, windows and ventilators, sanitation, water supply, power, the barn range, buildings west of the barn, buildings east of the barn, dairy buildings, pig-house and dungstead, cattle court, hay and sheaf sheds and the sheep "fanks" or mustering place. As there are 273 diagrams the descriptions are always to be understood. The author throughout supposes that he is appealing to tyros, amateurs or designers who may not have had experience with farm buildings, and acts on the principle that information cannot be too detailed to be explicit. The use of the volume is therefore not confined to England, for it would be a valuable endowment for farmers, who are mostly novices, who have decided to seek their fortunes in the colonies. Architects who are in cities pent have neither time nor opportunity to master all the requirements of buildings which are demanded when they have to be turned to agricultural

purposes. In Mr. HENDERSON's book those architects will find unadorned examples; they can convert them if clients are favourable into more ornamental structures, but, unless we are mistaken, there is little need to deviate from the arrangements. Economy and efficiency are mainly sought after by the author, and it is only in exceptional cases that any other quality will be desired by farmers.

#### THE DUCAL PALACE, NANCY.

IN Nancy is a large equestrian statue of JOAN OF ARC, who is represented as looking towards Germany and seems ready to lead an army in that direction. But with no less reason the position of the figure could be reversed. JOAN OF ARC, as a native of Domremy, was not a Frenchwoman, but a subject of the Duke of LORRAINE, whose

capital was Nancy. Many attempts were made during centuries to unite Lorraine with France, but that end was not fully accomplished until 1766. For a long time Lorraine might be considered as having acted as a buffer State. The Dukes of BURGUNDY looked on themselves as no less powerful than the Kings of FRANCE, and in the wars between the mighty opposites Lorraine repeatedly suffered. CHARLES LE TÊMÉRAIRE seized on Lorraine, and in 1473 sought to have himself recognised as a king instead of a duke. A league was formed against him. The duke, considering his forces inadequate against so many enemies, prevailed on the English monarch, EDWARD IV., to lend him his aid, and in 1475 a large army landed at Calais. LOUIS XI., the French king, however, was able to purchase immunity, and the peace was long known as "La Trêve Marchand." The same year CHARLES LE TÊMÉRAIRE entered Nancy as conqueror. Two years afterwards the duke was defeated under the walls of the city which he had destined for his capital. He was slain by an enemy who did not claim any distinction for the deed, and his corpse was mutilated.

It suggests a peculiarity of the time that immediately after the war Duc RÉNÉ II., the Lorrainer, commenced a new palace in Nancy on the site of one which had been built by Duc RAOUL, and was devastated. The works took several years to accomplish, and the grand entrance, of which we give an illustration, was not completed until 1512 by Duc ANTOINE. His successor, CHARLES III., added a *salle d'honneur*. He also enriched the palace with many masterpieces of art. On his death there were remarkable funeral ceremonies, of which engravings were prepared. They enable us to judge of the exterior as well as the interior of the palace at that period. They were the only documents employed for guidance during the restorations which took place in the nineteenth century. We need not closely follow the history of Nancy. It was conquered by LOUIS XIII. in 1633, and he retained possession of it for four years. The palace was occupied by a French governor, when the building was neglected. In 1641 the Frenchmen left the city, but in 1659 there was another attack, and the palace was pillaged. LOUIS XIV. stopped for a time at Nancy, and he considered the palace in which he resided as more commodious than the Louvre. Duke LEOPOLD, of Lorraine, preferred to live at Lunéville, and a part of the ducal residence was demolished in order to supply stones. After a time His Highness imagined the old palace could be improved. He added a second storey to a part where there was only one. Then he removed some of the most interesting features, and at length he grew tired of his meddling and left the building incomplete.

Nancy owes many of its characteristics, such as its triumphal arches, its beautiful wrought-iron gateways and balconies, to the Polish king STANISLAS LESCZYNSKI, who had married a princess of Lorraine, and became duke after his abdication of the throne of Poland in 1735. By his liberality Nancy rose to be one of the most interesting of modern cities, but he was indifferent to the ancient abode of the dukes. He made it over to the Municipality on the condition that it should be used as Government offices. It was found to be inconvenient for that purpose, and a series of transformations and demolitions began. The *Salle des Cerfs* in which the States used to assemble was changed into a public granary, with stables on the ground floor. But the eighteenth century had not closed when the Revolution broke out. The fanatical volunteers from Marseilles passed through Nancy. Regarding the palace as a representative of feudalism and royalty, they expressed their rage by the mutilation of the sculpture, and the great entrance which so many restorers had respected was the principal victim. For years the palace was allowed to fall into ruin. When more peaceful times arrived it was decided to make arrangements for the conversion of the remains into a prefecture. The Municipality of Nancy, however, claimed the liberty to employ the *Salle des Cerfs* for a picture gallery and museum. Their demand was in course of time agreed to.

Unfortunately, a fire occurred in August 1871, which added to the grief of the inhabitants who had seen their city occupied by German troops. The *Salle des Cerfs* was over-arched with wooden vaulting, above which was a massive framing to support the roof. The roof was one of the first parts to take fire, and the valuable collections of antiquities

relating to Lorraine which were kept on the first floor were consumed. The tapestries alone were rescued. At the two ends of the musée were rich Renaissance chimney-pieces, which were in a great measure destroyed. All the masonry of cut stones was reduced to powder, but it was observed that some rubble of an ordinary kind was, owing to its great thickness, able to resist the flames. The part on the ground floor in consequence of the masonry vaulting escaped to some extent, and various objects of art which were placed there are still to be seen.

At such a time the people were not in a condition to contribute largely. The restoration was in consequence of only a partial character, and the visitor now finds some difficulty in realising the extent of the original palace. What was executed was, as we have said, based upon the engravings which were prepared as records of the funeral ceremonies of 1608. As their accuracy was remarkable, there are grounds for accepting the modern restoration as having some claim to authenticity. The entrance especially appears to correspond with the ancient representations, and is accepted as the most characteristic part of the palace.

### THE CHURCHES OF CLEY AND BLAKENEY.

THE Norfolk and Norwich Archaeological Society recently visited some of the quaint old-world villages which fringe the bleak northern coast line, including Cley and Blakeney.

The Cley of the present day, says the *Norwich Mercury*, is but the shadow of its former greatness, but its undisturbed quiet and wide variety of scenery are evidently an attraction for a great many holiday-makers, for the village just now presents quite an air of bustle and importance. Arrived at the church, which has also shared in the general decay, and is but the ghost of the magnificent structure it was evidently intended it should be, Dr. Bensly read a few notes upon its architectural characteristics. It was difficult, he pointed out, to fix precisely the date of the structure, but the earliest work traceable pointed to some considerable time prior to the thirteenth century. The lower portion of the tower appeared to be the oldest part of the fabric, and then in succession the chancel, nave and aisles were taken in hand. The transepts were also begun but never completed, for the ravages of the Black Death, here as elsewhere, put an end to all church building. In their ruined state, weather-worn and time-stained, these remain incomplete to the present day. The extent of the work which was once planned told of a large and prosperous community in those remote days, whereas now quite five centuries and a half after the plague the whole population scarce suffices to fill the church. At the present day the north aisle is completely boarded up, and even of the remaining space only a small part is screened off for purposes of worship. A priest's chamber over the south porch, till within recent years exposed to the elements, has been suitably roofed over. Locally it seems to be known, for some mysterious reason, as the "old maids' chamber. Among its curious contents is a massive iron-bound chest, which must have been built where it stands, for it would be impossible to get it out of the chamber by the only means of ingress, the narrow turret staircase. In the churchyard one noted tomb records the burial-place of Capt. James Greeve, who, in one of Cloudesley Shovel's maritime enterprises, helped "in burning ye ships in ye port of Tripoly, in Barbari, January 14, 1675-76, and for his good service performed was made captain of ship called the *Orange Tree of Algier* in 1677, and presented with a medal of gold by King Charles ye 2. He died April 14, 1686, aged 48 years."

Blakeney, where, as the popular rhyme goes, "the people stand on the steeple and crack hazel nuts with a five-farthing beetle," was the next object of research. Mr. J. Oldrid Scott, a resident, and evidently an enthusiast on the lore of the locality, kindly undertook the office of guide to the beauties of this extraordinary fine church. Dedicated to St. Nicholas, the patron saint of mariners, this noble building serves a doubly useful purpose, inasmuch as at its north-east angle is a second tower, in miniature, designated the lighthouse tower, and built and utilised for the very purpose of guiding the home-coming mariner along the treacherous stretch of water that lies between the sea and the once busy harbour of Blakeney. The two towers certainly are a most conspicuous feature in the landscape. Mr. Scott said the architectural history of the church is very simple, for only two styles are represented, the beautiful brick groined chancel dating from the middle of the thirteenth century, and the very noble nave from the fifteenth. Why it became necessary to rebuild the Early English nave only some 200 years after its erection cannot now be determined, but it is very probable that it was burnt down, though there is no direct evidence of this. The traces of the older nave are very slight—two of the Early English columns were placed against the eastern jambs of the

two eastern windows of the north aisle, no doubt to carry figures connected with chapels. There is part of an Early English corbel inserted over the doorway which led to the rood-loft, and it seems very possible that the stones of the inner order of the beautiful nave arcade once formed a part of the corresponding early arcade. Of the nave and tower little has to be said. They are of most admirable design, while all the details are refined and appropriate to their general position. The proportions of the interior are entirely satisfactory. The roofs, though not so rich as many in the eastern counties, are very pleasing, and one is glad to see how carefully they have been restored. The only old benches are the very simple ones in the south aisle. The font deserves especial attention. The lower part is adorned with shields bearing emblems of the Passion. Mr. Scott said one of them was a puzzle to him for some time, when he discovered that it was the sword with which St. Peter cut off Malchus's ear. The ear is shown sticking to the blade. There are two shields carved on the plinth of the tower buttresses, one of which bears the arms of the see of Norwich—three mitres labelled, the lower one transfixing with a crozier in pale. The other shield bears a dolphin embowered with a cross above it on an escutcheon, all within a bordure charged with escallops. This shield has probably to do with St. Nicholas, the patron of the church, and of fishermen in general. Inside the tower there is a small niche on the north side. Six holes are cut in its floor. They were probably used to hold the candles of those attending funerals. The north porch is a somewhat later addition. The few remains of stained glass collected in one of the aisle windows deserve attention. The chancel requires careful examination. It is groined in two square bays. The western bay has two similar windows on each side. These have had later tracery inserted for some reason which is not apparent. The old windows consisted of three lancets each, as may be seen outside, on the south side, where the original sill was left when the later window was inserted above the sedilia. The three lancets correspond in width with the two outer ones in the seven-light east window. Above the chancel groining there is a chamber approached by the turret, which is continued upwards and forms the lighthouse tower. In the west wall of the chamber there is an Early English doorway which must have opened into the church above the chancel arch. It may have been used for reading the Gospel from till the later rood-loft was erected. When this was done the door ceased to be of any further use, and it was blocked up by the rood, the beam for which still remains, and is now occupied by the rather handsome frames containing the Commandments, &c. The church is one which no one who has had the good fortune to visit it will easily forget. Its noble western tower and its unique lighthouse turret, its grand nave, with a tower arch hard to match in any other church, its lovely groined chancel with the rare feature of an east window consisting of seven lancets, make up a whole which gives to Blakeney Church a distinction hardly to be met with anywhere else.

Before leaving the place, a quaint pebble and brick built structure, overlooking the harbour, was examined and proved to be the crypt of a guildhall that the town once boasted. It, too, had its subterranean passage, now blocked up. The groined roof of the crypt is still in fair preservation.

### TESSERÆ.

#### Choirs in Churches.

THE form which choirs have assumed in England and in Northern Europe is well known. At Milan, where the Ambrosian rite still prevails, the choir is raised some steps above a "confessione," and is surrounded by stalls, while two ambones, considerably elevated and of most beautiful form, stand at the extreme ends of the choir seats, close to the nave. At Rome, and in some places in Tuscany, the choir is in its primitive position before the altar. In many other places it is behind the altar in a sort of lady chapel; in others, and by far the greater number, it is in a separate side chapel, sacristy or chapter-house. The main difference in the North of Europe is the position of the cancelli or rails. They formerly separated the altar from the choir, now they separate the choir from the nave. The idea that the laity should never enter the chancel or choir has always been a puzzle to antiquaries. The practice of going to the high altar is so often named, it has also seemed so difficult to believe when we see such a choir as that at Canterbury, raised up so many steps and enclosed by such a massive screen and such high walls, how a service was celebrated at which the laity were called on "to draw nigh," and where they could neither draw nigh, nor see, nor hear. But there is the positive testimony of Barclay in the "Shippe of Fooles," which shows that the laity were not only admitted to the church, but also the choir or quere. The second part of the homily "On the right use of Churches" says, "They never cease their uncomely walking and jetting up and down and

overthwart the church; and speak covetously and ungodly, scarce honest or fit for tavern or alehouse, in the house of the Lord." Besides this, we have the well-known custom in France and Belgium, as well as in our own cathedrals to the present day, that the laity are and always have been admitted freely into the choirs. In the different towns in Italy the laity, men and women, entered what we should call the different chancels when mass was said and took their seats in the stalls, or wherever was most convenient. The word chancel is never applied to any portion of the building, but only to the gates, and railings, "cancelli," which separate the various chapels from the other parts of the church; that what we call the choir is by them called by its primitive name tribune—the ancient bema—and that the "coro" or quire is in any place, side chapel or otherwise, where it may be conveniently held, and, besides this, that it is shifted from place to place at different times according to weather, and not only so but that in most cases it ceases to be called the choir when the choir or monks who form the choir and who sing the breviary services have left it. But still, and here seems the point whence all these errors have arisen, while it is a choir—that is, while the breviary or choir services are going on—the gates or "cancelli" are carefully closed; sometimes curtains are drawn before them, and the laity are always rigidly excluded. A still more striking instance is found in the Jesuit churches, which are all built without chancels or choirs. Ignatius Loyola found the system of assembling every three hours for short services so interfered with the life of active exertion which he required from all his followers that this obligation is omitted in his constitutions, and as thereby choirs would have been useless they are never erected in Jesuit churches.

#### Greek Painting.

Plutarch tells us that Euphranor painted the engagement of the cavalry at the battle of Mantinea as if he had been inspired. The painter had never merited such singular praise, had he not wrought his subject to the nearest semblance to truth, and that this could not have been without a particular attention to the disposition, the same writer proves in another instance when, speaking of the battle fought by Arastus against the Etolians, he adds that Timanthes the painter brought this action, as it were, before the eyes of the beholders by the evidence of his disposition. Thus it is plain that the inspiration of Euphranor and the evidence of Timanthes flowed from the same excellence, an union of the two kinds of disposition, the expressive and the picturesque. "The drama of painting."—It was with great propriety so termed by the ancients, because, like a dramatic poem, a picture contains, first, a subject or fable; secondly, its order or contrivance; thirdly, characters or the manners; fourthly, the various passions which spring from those characters. Philostratus, speaking of the composition of a picture, calls it in express terms the drama of the painter; Pliny has the same idea to his commendation of Nichophanes. But we shall be better satisfied of the justness of this application by examples than by authorities. It was the opinion of Nicias, one of the greatest of Greek painters, that the subject was of no less consequence in painting than the fable in poetry, and, of course, that great and noble actions tended to elevate and enlarge as the contrary must humble and contract the genius of the painter. The ancients had great advantages in this particular; they had not only their profane history, rich in the most glorious and interesting events; but their sacred, whilst it furnished them with new ideas of the sublime, gave no check to the pathetic. Their gods, superior in grace, majesty and beauty, were yet subject to all the feelings and passions of humanity.

#### Indo-European Building.

History does not inform us of the condition of the parent people from which it is assumed the Indo-European nations have sprung. But knowledge of this kind would be very useful, indeed is indispensable, to enable us to exercise a critical judgment upon the obscure events which constitute the only historical evidence which can be brought forward to support the presumed migrations of races. We must accordingly seek for this information in some other quarter, or rather in the only one to which we could look—an examination and comparison of all the words expressing family relations, government, cultivation, &c., now existing in the Indo-European languages. The chief occupation of the parent Indo-Europeans was the herding of cattle, as is proved by the number of words, especially in Sanscrit, which appear to have originated in pastoral habits. Great wealth was connected with the possession of cows, and the vedas are full of allusions to the ancient pastoral life. At an early period, too, there must have been considerable associations of people among the parent race, because in addition to the word "vic," denoting a place, we find already in the vedas the word "grāma" for village, and the word "pur," or in the later form, "puri," for city. Now the word "vic" is probably the root of the Latin "vicus," village, and of the great number of derivatives which have

been formed from it, while the Greek "polis" = city, corresponds exactly with "puri." They also had regular houses. In Sanscrit, "dama"; Gr., "doma"; Lat., "domus"; Rus., "domi." According to Grimm the Gothic word "timrjan," to build, contains it, being related to "demein" (Ion. pro "oikodomein") to build a house. A similar correspondence may be observed between the parts of a house; thus, for example, "door"—Sanscrit, "dvār," fem., "dvāra"; Old Persian, "dhuwara"; Kurd, "deri"; Armenian, "durhn"; Gothic, "daur"; Gothic of the Crimea, "thurn"; old high German and old Saxon, "dor"; Lett. "durwis" ("durris"); Lithuanian, "durrys"; Rus., "dver," plural, "dveri"; Greek (plural), "thura."

### Stothard's "Wellington Shield."

The Wellington Shield was the work in which the genius and art of Stothard were most remarkably displayed. This testimonial was subscribed for by the bankers and merchants of London, the competition being made open to the silversmiths, whose designs were to be approved by the committee. Stothard was applied to by every house which competed. He gave the preference to Ward & Green, who were till then strangers to him. He had only three weeks to the day fixed for receiving the designs. The first thing he did was to read and make extracts from the histories and despatches of the war. The Shield of Achilles, by Flaxman, which he greatly admired, he took as the basis of his design, and imitated it in planning a series of compartments with separate subjects. Commencing with the battle of Assaye, he depicted scenes from all the great victories of the European war. In the centre the duke is represented on horseback, surrounded by the chief officers of his army. The management of the horses in this group is much admired. The designs were done in sepia, and on being examined by the committee were selected unanimously, although some distinguished artists were among the competitors. It is stated that Westall received from the same house (Ward & Green) 500*l.* for his unsuccessful designs. After the designs were approved, difficulty was experienced in getting the models executed, the artist employed having died before commencing the work. Stothard volunteered to prepare the models, although this was a kind of work which he had never attempted. He did not even know the usual mode of procedure, but taking a camel's-hair pencil, he laid on the soft clay after his own ideas. His attempt was entirely successful, and sculptors who saw the models pronounced them admirable. He had far more difficulty when the chasing in silver began to be executed. Repeatedly did he complain of the sad want of knowledge of effect and deficiency in drawing among chasers of silver, who ought to cultivate the art of drawing in order to enable themselves to execute well the practical parts of their own art. He said also that so great was their self-conceit that while teaching them by instruction and criticism, accompanying his remarks with delineating what he wanted them to understand, instead of attending to him, they would turn aside their heads with the most careless indifference, so that at the last he saw the task completed in its chasing with anything but satisfaction. This led him to resolve to make etchings of the designs, the same size as the originals. Of engraving he was also practically ignorant. In this, however, he was also successful, so much so that Heath, who accidentally heard from the copperplate manufacturer what Stothard was about, on seeing the plates, expressed his wonder and admiration. The engravings are now very valuable. With the designs of the shield the Duke of Wellington was highly pleased, and the reputation Stothard obtained by the work procured for him much advantageous employment.

### B. E. Murillo.

The influence of the style of Vandyke upon Murillo, produced by the intimacy of the latter with Pedro de Moya, a pupil of the great Flemish painter, seems to have mainly engendered in him that earnest desire to inspect the originals which made him contemplate visiting England, and which actually led him to the capital of Spain. Here his reception by and intercourse with the great Velasquez forms almost the only important epoch of his life, and no circumstance of his existence so forcibly arrests the imagination or so well deserves the efforts of commemorative art as the introduction of that young, eager and uninformed genius to the treasures of the royal galleries, under the guidance of the splendid and courtly officer of Philip IV., himself a master in art and noble in every sense in which humanity can be dignified. It was not till the return of Murillo to his native town, where the remainder of his life was spent, that his own peculiar genius worked itself free from the influences of Titian, Vandyke, Ribera and Velasquez, and became itself a leading star in the art firmament. The narrative of his life from this period is a simple record of an existence in which neither idleness nor weariness found a place. In a city peopled with monks, with picturesque mendicants and enthusiastic devotees—in a city

filled with mysterious churches—lit up, as La Fontaine would say, by the eyes of Andalusian beauties, Murillo passed his time in copying the inhabitants of earth and inventing those of heaven. His whole world was summed up in the city of Seville. On the road which he had to traverse from the parish of Santa Cruz, in which he resided, to the cathedral of Seville, or else to the convent of the Capuchins outside the walls, he lost nothing that occurred to attract his notice. If he met the licentiates Alonzo Herrera and Juan Lopez y Talavan he was struck with their fine heads, and he introduced them under the names of St. Leander and of St. Isidore into some devotional picture. Without the necessity of travelling or of crossing the seas he could handle a thousand different subjects and paint in every branch of the art—landscapes, flowers, sea-pieces, portraits, history and miracles; miserable humanity cowering on the pavement and beatified mortals wafted through the regions of Paradise.

### Florentine and Doric Architecture.

The Florentine is the Doric style of modern palatial or domestic architecture. Admitting of little apparent ornament, but any degree of real richness—genuine, polite, full of thought for the spectator, with no display, no obtrusive art, always more artless the more it is studied, and artificial, always appearing to contain less work, both mental and manual, than it really contains—this style even in the smallest buildings delights the cultured eye by its truly Grecian refinement, yet awes, on the great scale, by a sublimity that only the Doric temple ever surpassed. This quality arises from the leading principles being perfectly Dorian—severe contrast in principal forms (which indeed are more exclusively rectangular than those of the Doric order itself); strict subordination of the lighter classes of form; powerful masses self-poised, without corbelling, without arching; breadth of everything, of light, of shade, of ornament, of plain wall; depth of recess in the openings, of perspective in the whole mass, of projection in the cornice. To these we must add another attribute, not much observable in the Doric (nor perhaps any temple architecture), and remarkably deficient in the other modern schools. This is a sort of utilitarianism, or absence of features useless to convenience or stability; an absence of sacrifice to architecture proper—i.e. sacrifice of material—but abundant sacrifice thereto of thought; and of manual labour, an amount quite optional, this (like all real styles) admitting of great plainness or very florid enrichment. On the whole, the Florentine may be called the common-sense school, and its importation into this country by Barry is a benefit that should atone perhaps for many failures.

### Tibetan Monasteries.

The chief city of Western Tibet is Le. The principal monasteries in the neighbourhood are at some distance from the town in the vicinity of villages both up and down the Indus; but religious edifices, of the many kinds which are everywhere so common in Tibet, are seen all round Le in great numbers. Along the road by which the town is approached there is a very long building, of the kind called Mane, extending for more than half a mile. It consists of two parallel walls, 12 to 15 feet apart and nearly 6 feet high, the intervals between which are filled up with stones and rubbish and the whole covered with a sloping roof, which rises at a gentle angle to the central ridge, midway between the two walls. On the roof are laid large slabs of slate, every one of which is covered with Tibetan letters, or more rarely with a rude drawing of a temple. The words on these stones are a repetition of the mystica Buddhist prayer, from one of the words of which these curious and apparently useless erections take their name. The Mane seems one of the most indispensable accompaniments of a Tibetan village, and they may occasionally be seen even in desert tracts; so that the amount of labour which has been expended in their construction must have been very great, some of the largest containing many millions of repetitions of the words "Om Mane Padme Hom." In the smaller villages they are often very inferior in size, sometimes not more than 20 or 30 feet in length and 3 feet high. Every traveller has constant occasion to notice that in passing these walls the Tibetans always leave them on the right hand, considering it both wrong and unlucky to do otherwise; those proceeding in contrary directions therefore take opposite sides. Equally conspicuous in the environs of Le are the urn-like buildings called Chokten or Chosten, which are erected over the ashes of lamas, or priests, and are therefore in a country where a third or fourth part of the male population adopt a monastic life particularly abundant. Long rows of these, consisting of twenty or more urns of various sizes, may often be seen in conspicuous places above the villages, forming, from the brilliant whitewash with which they are covered when new, very prominent objects. Many of those near Le are of large size and ornamented with rude paintings of dragons and other mythological animals of uncouth form.

## NOTES AND COMMENTS.

TRADE has its victories as well as war. One has just been gained which can be credited to English enterprise. An immense memorial of MOLTKE is about to be executed, and it was decided to employ Pentelic marble. The order was given to the English company who are now working the Athenian quarries. They have been able to obtain a block which measures 32 cubic metres, weighing about 100 tons (German). There has been some difficulty in transporting the block. It was necessary to construct a special waggon to bring it to the Piræus, but the mass is beyond the capacity of any of the vessels trading to that harbour. The English company also supplied the block for the statue of the late Empress FREDERICK, which has been erected in Berlin. When it is remembered that Germany is, next to Russia, looked up to as the most powerful country by the Greeks, and that for many years German archaeologists have been recognised as the first authorities on all questions relating to ancient art, it becomes more noteworthy that recourse should be had to an English company for a supply of marble resembling that which was so much used in Greece.

THE report of the Labour Department of the Board of Trade on changes in rates of wages in 1901 has been published. In the introduction Mr. H. LLEWELLYN SMITH mentions that for the first time since 1895 a decline of wages has to be recorded. It was found that about 430,000 workpeople received advances during the year amounting to 41,000*l.* per week, while 493,000 sustained decreases amounting to 118,000*l.* per week. The net weekly decrease for 1901 was accordingly 77,000*l.*, which compares with increases of 209,000*l.* in 1900 and of 91,000*l.* in 1899. The decline is accounted for mainly by the fall in miners' wages. The metal, engineering and shipbuilding groups of industries had also to accept reductions, the average net reduction being 4*s.* 1*d.* per head. The building trades appear to have been fortunate. The statistics show that 39,687 workpeople received an increase amounting to 1,943*l.*, or 11½*d.* per head. With 4,499 building workmen there was an aggregate reduction of 3,719 hours per week, or an average of 0·83 per head. On the whole it may, therefore, be regarded there were but slight changes in the building trade, and that was more satisfactory than any remarkable reduction.

REMBRANDT, after remaining three years with the painter, JACOB VAN SWANENBURCH, became the pupil of PIETER LASTMAN, who then possessed some renown. The poet, JOOST VAN DEN VONDEL, testified in verse to a remarkable picture by LASTMAN which dealt with the scene when St. PAUL and St. BARNABAS were assumed in Lystra to be JUPITER and MERCURY, because they had healed a man who was lame. The scene was also used by RAPHAEL in one of the cartoons. LASTMAN'S painting, which was executed in 1614, has long disappeared, and was thought to have been destroyed. It has, however, been discovered by Dr. ABRAHAM BREDIUS, who was connected with the State Museum at Amsterdam, and is now Director of The Hague Gallery. He found it in the collection of Count STETSKY in St. Petersburg, and its condition testifies that VONDEL did not exaggerate when he spoke of the colour and power of the painting. Permission has been given for its exhibition at The Hague.

THE palace of the Luxembourg is one of the buildings which was associated with the triumphs of the first NAPOLEON. In 1797 the Directory gave him a reception in it when he returned to France with the treaty of Campo Formio. It was at the Luxembourg that he planned his *coup d'état* of the 18th Brumaire. In 1801 the building was used as the palace of the Senate, and in 1806 fifty-four flags captured from the enemy were deposited there. Afterwards there was a fête and banquet, at which representatives of the Grande Armée were present. It was fitting that a commission should be given for an immense painting to be placed in the building, and which was to commemorate the Triumph of NAPOLEON. The antique style was then in vogue, and JEAN BAPTISTE REGNAULT, to whom the commission was accorded, showed the sovereign as a Roman emperor seated on a triumphal car, and surrounded by figures of Victory, Concord, Peace and Wisdom.

But in 1814 the power of NAPOLEON waned. The controller of the Luxembourg was SEMONVILLE, and he lost no time in becoming a Royalist and in transforming the hall of the Senate in order that it might be worthy to receive LOUIS XVIII. All the symbols of Napoleonism were whitewashed or removed. From a large bust of the emperor the head was taken off, and a label was placed on the part remaining to announce that it was a bust of NERO which was in the process of restoration. The immense picture of the Triumph could not be treated in the same way. SEMONVILLE was therefore compelled to give an order to a painter to substitute the face of the king for that of NAPOLEON. The emperor, however, unexpectedly returned from Elba. SEMONVILLE fled, and the architect in charge of the palace had the visage of NAPOLEON restored. After the Hundred Days the king came back and SEMONVILLE was once more in power, but he had been taught to realise how insecure was sovereignty in France, and REGNAULT received 400*l.* to paint out the figure of NAPOLEON and to substitute one of a woman typifying France.

NEW ROYAL INSURANCE COMPANY'S OFFICES, BRIGHTON.

THE Royal Insurance Company of Liverpool and London, having purchased an important corner site in the main thoroughfare of Brighton, have instructed Messrs. CLAYTON & BLACK to design and erect a commanding block of buildings for their south-country branch. The illustration published in this issue shows the intended structure, which will be largely of grey Aberdeen granite, with terra-cotta for parts of the upper storeys. Besides the accommodation for the company in this Royal Insurance building, chambers are provided and offices for auctioneers and others. The cost, including the site, will be nearly 30,000*l.*

LLOYD'S BUILDING, FENCHURCH STREET, E.C. STAIRCASE MIDDLE. LUNCHEON-ROOM.

THIS building has been erected for Lloyd's Register of British and Foreign Shipping. It is situated in and forms an important architectural improvement in Fenchurch Street and the new street which has been called Lloyd's Avenue. The whole of the two elevations is faced with Portland stone, and the fine sculptured work has been carried out from the designs of Mr. G. FRAMPTON, A.R.A., and the ornamental carving by Mr. TAYLERSON. The board-room is 47 feet by 28 feet, and has an elliptical ceiling carried by marble columns, between which is inlaid mahogany panelling. The ceiling was decorated by Mr. GERALD MOIRA. Over the principal fireplace is a large marble-sculptured panel by Mr. PEGRAM. The staircase and entrance-hall has been lined with very beautiful Devonshire marbles supplied by Messrs. JENKINS & SONS, of Torquay, and by Messrs. BURKE. On the first floor of the staircase is to be seen a remarkable bronze and ivory frieze designed and executed by Mr. F. LYNN JENKINS. The panelling in the committee-room is English oak, and that in the library is African mahogany with inlaid ornament. The fine specimens of ornamental plasterwork have been carried out by Messrs. JACKSON & SONS, of Rathbone Place, W. The contractors were Messrs. JOHN MOWLEM & Co., and the whole of the work has been carried out from the designs and under the superintendence of the architect, Mr. T. E. COLLCUTT, F.R.I.B.A., of 36 Bloomsbury Square, London, W. Views of the exterior appeared in our issues of July 25, August 1 and August 15, and interior views on August 22 and 29.

PROPOSED BANK, HOVE, BRIGHTON.

THE building illustrated was designed to occupy a unique site in Church Road, Hove, but an arrangement having been made with the Hove Corporation the road will now be widened and the building will not be erected, its place being taken by a new road across the Vallance Estate to the sea. Messrs. CLAYTON & BLACK, of Brighton, the surveyors to the estate, are the architects.

## STROOD, COOLING AND CLIFFE.\*

CONTINUING our pilgrimage along the Roman Watling Street (Vitellina Strata) from Greenhithe and Gravesend, through Chalk and Milton, we come to Rochester, Chatham and Strood; these may be described as a sort of miniature London, Westminster and Southwark. They are all situated on the banks of the Medway, and formed the Roman half-way station between London and Canterbury, being about thirty miles from either. The Romans adopted the principle of extra-mural interments, and Strood was the Roman burial-place for this district. Some years ago the site of a Roman cemetery was discovered near the Temple Farm, Strood, when upwards of 700 coins of Antoninus, Claudius and Nero were found, and among them were a few specimens of Carausius, very rare, and a silver denarius (the Roman penny). Strood, or Stroud, is called in the Textus Roffensis, Strodes, and is described in Hasted as Stroud alias Temple; the church is dedicated to St. Nicholas; it was formerly a chapel to the parish church of Frindsbury. It is not valued in the King's books. Frindsbury, with its appendages Æslingham, Bromhay, &c., was given to the church of Rochester at different times during the Saxon Heptarchy. Offa, king of the Mercians, in 764 gave twenty ploughlands in Æslingham, lying on the western side of the Medway, to Eardwulf, Bishop of Rochester. About the same time King Sigered, of Kent, confirmed the above grant.

These estates had been wrested from the church of Rochester in the troublous times which soon after followed by reason of the Danish wars. They came afterwards into the possession of King Harold, and on the accession of William I., were given by him, among other estates, to Odo, Bishop of Baieux, his half-brother; but Archbishop Lanfranc recovered them again in 1076, and afterwards restored them to Bishop Gundulph. Frindsbury is described in Domesday Book as Frandesberie. The village joins the north side of the town of Strood, forming one of its streets, through which the high road lies from thence to Cliffe and the Hundred of Hoo.

Frindsbury Church is dedicated to All Saints. At the time of Bishop Gundulph coming to the See of Rochester in the reign of the Conqueror there was no church here; but before his death one was built of stone by Paulinus, sacrist of the church of Rochester. In later times Bishop Richard Young was a large contributor, and glazed all the windows. Bishop John, in the reign of Henry II., gave to the church of Rochester, Frindsbury Church, together with the chapel of Strood. The parsonage of Frindsbury and advowson of the vicarage still continue part of the possessions of the Bishopric of Rochester.

Upnor Castle is situated in this parish, opposite to Chatham Dock. It was erected by Queen Elizabeth in her third year, and presents a very picturesque appearance from the Medway. It was visited by Hogarth during his memorable five days' tour from Gravesend to Rochester, when he made two sketches, one of Upnor Castle, and the other the interior of a barber's shop.

To return to Strood, this manor, with the Hundred of Hamel, was given by King Henry II. to the Knights Templars, who had a mansion in the southern part of this parish near the banks of the Medway, which from their possessing it acquired the name of Temple Manor. This gift was confirmed to them by King John and his son Henry III., but in the beginning of the reign of Edward II. the Knights Templars, on pretence of their vicious lives and overgreat wealth and power, were seized and imprisoned, and their lands and goods confiscated. The whole order of them was dissolved in 1312, and Pope Clement V. immediately granted their lands and goods to the Knights Hospitallers, and the king, Edward II., confirmed this grant, November 28, 1313. Edward III. granted the manor of Strood to Mary de St. Paul, Countess of Pembroke, widow of Guy de Valence. She intended to have built a religious house at her manor here, but, altering her mind, she gave it in the eighteenth of that reign to the monastery she had erected at Denny, in Cambridgeshire. The manor of Strode, alias Temple, continued in the possession of that monastery till its dissolution by Henry VIII., who granted it to Edward Brington, who alienated it to Sir George Brooke, Lord Cobham. His grandson, Henry Brooke, Lord Cobham, being convicted of high treason in the first year of James I., was pardoned his life; yet he forfeited all his estates to the Crown, and among them this manor of Strood. Soon after this manor was granted to Sir Robert Cecil, Earl of Salisbury, K.G., who married Elizabeth, sister of Henry, Lord Cobham, above mentioned. He died in 1612, and was buried at Hatfield, leaving this manor to his son and heir, William, Earl of Salisbury, who alienated it to Bernard Hyde, of London. His son, John Hyde, sold it to James Stuart, Duke of Richmond. It afterwards passed to the Blague, Lampport and Whitaker families.

The manor-house still exists about a mile south-west of Strood, pleasantly situated on the banks of the river Medway, and is called Temple Farm. It has a spacious vault beneath the building with groined arches in excellent preservation. A great room above overlooking the Medway with large bay window is of the Elizabethan age, and has since undergone but little alteration. It was near here where the Roman cemetery was discovered, before described.

Gilbert de Glanville, Bishop of Rochester (tempus Richard I.) built a hospital here near the east end of the church, afterwards called Newark or Strood Hospital. It was founded for cherishing poor, infirm and impotent travellers therein; but Henry VIII. did away with all these things, and their wants have never since been supplied. A few traces of the old walls of this hospital are still to be seen. If these old stones could speak, how they might denounce our modern poor laws, and say what they think of them. I have mentioned the church, which is adjacent. It is a very spacious modern structure, and, excepting a brass to T. Glover and his three wives, there is not much of interest. It was erected in 1812 at a cost of 8,500*l*. The tower is the only portion remaining of the old church which occupied the site of the present edifice. About the year 1832 a bell metal seal was found in a garden near the church, which by the inscription is supposed to have belonged to a monastery in Cambridgeshire. In 1772, some British coins of Elizabeth, James I. and Charles I. were found in an old hedgerow.

*Cooling.*

Hasted says:—"Eastward from Cliffe lies Cowling, anciently written Colinges and Culinges—so called from its cold and bleak situation." Cœnulf, king of Mercia, A.D. 808, gave to his faithful servant Eadwulf one plough land and a half, with all its appurtenances in Culinges, according as the bounds are in his charter mentioned. In the reign of King Edward the Confessor, the lordship of Culinges was in the possession of Earl Leofwyne, sixth son of Earl Godwin. He was slain at the Battle of Hastings fighting on behalf of his brother, King Harold, 1066, against William the Conqueror. William gave Culinges, among other vast possessions, to his half brother, Odo, Bishop of Baieux, as described in Domesday Book. On the disgrace of Odo, who became Earl of Kent, about four years afterwards, these estates at Cooling, or Cowling, as well as the rest of his possessions, became forfeited to the Crown. In the reign of Edward I. Cowling was in the possession of Henry de Cobham, of Cobham, in this county. His son, John de Cobham, in the reign of Edward III., obtained a charter of free warren within all his demesne lands in his "lordship of Coulyng," among others. In the twentieth year of that reign, at the making the Black Prince a knight, he paid respective aid for this manor, as one knight's fee, which Henry de Cobham before held in Coulyng of Margery de Revers as she did of the king. He died possessed of this manor the thirty-sixth year of that reign, and was succeeded in it by his son John de Cobham, who in the fourth year of King Richard II. obtained a license to embattle and fortify his manor house, which he then erected here, which grant he caused to be engraved on a brass tablet, and placed on a tower at the entrance of it, where it still remains visible, and henceforward this mansion acquired the name of Cowling Castle. This tablet is made in imitation of a deed or charter with his seal of arms affixed; the inscription is as follows:—

Knoweth that beth and shall be  
That I am made in help of the contre,  
In knowledge of whiche thinge  
This is chartre and witnessing.

It appears there was then a large park adjoining the castle. He died possessed of this manor and castle in the ninth year of Henry IV. leaving Joane, his granddaughter (daughter of Joane, his daughter, by Sir John de la Pole, knight), his next heir, then thirty years of age, and wife of Sir Nicholas Hawberk, knight, whom she had married on the decease of Sir Reginald Braybrook, knight, her former husband. She afterwards married Sir John Oldcastle, knight, who in her right possessed these premises, and, on account of his marriage with her, assumed the title of Lord Cobham, and had summons to Parliament accordingly in the eleventh year of King Henry IV. Hasted goes on to say:—"But in the next reign (Henry V.), engaging with others in a conspiracy, he was tried for it, condemned and executed." As a matter of fact, he was really accused of heresy, and summoned before Thomas Arundel, archbishop of Canterbury, and became the first Protestant martyr. For full account of these proceedings, see "Foxe's Book of Martyrs." Sir John on this accusation of heresy betook himself to his castle of Cooling as to a place of strength and security, before which the person sent with a citation from the Archbishop appearing, desired leave of him to enter and leave the same, but was refused, on which, not daring to enter without leave, he returned without performing his errand.

An old play ascribed to Shakespeare give a humorous

\* A paper read by Mr. W. F. Potter, architect, before the members of the Upper Norwood Athenæum.

account of the failure to deliver this summons. Lord Cobham's sentinel is named Harpool, and the Archbishop's apparitor is termed Sumner (a contraction for summoner), when the former compels the latter to eat the summons, parchment, wax seal and all, and so return to the Archbishop without delivering it. Sir John was, however, apprehended and tried, and committed to the Tower, from which he managed to escape into Wales, where he remained for four years, but was again seized and executed pursuant to his sentence, which was to be hanged for conspiracy and burnt for heresy. This cruel sentence was carried out in St. Giles-in-the-Fields, where a gallows was erected, and he was hanged to satisfy the State, over a slow fire underneath that his body might be burnt to satisfy the Church.

Happy we, living in different times.

After the execution of Sir John Oldcastle, Joane, his widow, became again possessed of this manor and castle, together with the advowson of the church of Cooling, and after marrying her fourth husband, she died in the twelfth year of Henry VI. She left a daughter, Joane, by her second husband, who married Sir Thomas Brooke, who became in her right the next Lord Cobham. His grandson, Sir John Brooke, Lord Cobham, died in the twenty-second year of Henry VII., seized of this castle, manor and advowson. His grandson, Sir George Brooke, Lord Cobham, K.G., resided at times here, and at Cobham, and died September 29, 1558. It was during his tenancy that Sir Thomas Wyatt raised his rebellion, and on January 30, 1553, he marched with six pieces of cannon to this castle, which, finding too strong to take, after having broken down the gate and part of the wall, and having some discourse with Lord Cobham, who was in it, he marched away next night to Gravesend. This Lord Cobham was succeeded by his son and heir, Sir William Brooke, Lord Cobham, who died in the thirty-ninth year of Queen Elizabeth, and by his will left this estate to his second son, George Brooke, who, being engaged with his brother Henry, Lord Cobham, and others in a conspiracy, was attainted of high treason in the first year of James I. After which King James restored the manor and castle of Cooling to his son William, then an infant, afterwards a Knight of the Bath, who died possessed of them about the year 1668. He left four daughters, all married, and their husbands in right of their wives joint proprietors of this manor, castle and advowson.

Hasted says:—"The ruins of the castle show it to have been a place of some strength. There are great parts of the towers and outer walls of it remaining; it was a square building having a moat all round it, which is now almost choked up. At a small distance south-east from the castle is a handsome gatehouse, flanked by two round towers, embattled, and with rich machicolations. Cannon balls made of Kentish ragstone have been found here, which no doubt were used in storming the castle. Rude pitchers have also been found, and in clearing away the rubbish from the walls a large vessel has been cut through, which proves that the tide once flowed up to the castle, though now 2½ miles distant from the river Thames.

Cooling Church, dedicated to St. James, is a small Gothic structure with a tower. In the year 961 Queen Ediva, wife of Edward the Elder, and mother of King Edmund and King Edred, gave to Christ Church, Canterbury, all her lands in Cūlinge, free from all secular service, except that of repelling invasions and the repairing bridges and castles. Edward II., July 14, in the tenth year of his reign, granted to the priory of Christ Church free warren in all their demesne lands in this parish, among others therein mentioned. The patronage of this church in the reign of King John belonged to Adam Pincerne; it afterwards (tempus Edward I.) passed into the hands of the Cobham family. There is a brass in the church to Faith Brooke, daughter of Sir John Brooke, Lord Cobham, 1508. There are fine steel engravings of both castle and church in Stockdale's "Views in Kent."

#### Cliffe.

This place is generally regarded as the Cloveshoo (Cliffe at Hoo), at which during the seventh and two following centuries, numerous councils of the Saxon Church were held. This place is first mentioned in 673, when Archbishop Theodore in a council at Hertford arranged with his bishops and clergy for an annual meeting at Clofeshoch (Ven. Bede). It is called Cliffe at Hoo from its nearness to that Hundred. This manor, with its appurtenances, was given to the Priory of Christ Church, Canterbury, in the time of the Saxon Heptarchy, and its possessions were afterwards increased here by King Offa, who in A.D. 791 gave Dunmalingdene, and by Queen Ediva, who gave Oisterland, all which remained part of the possessions of the Priory at the consecration of Archbishop Lanfranc in 1070. These possessions are described in the Domesday Survey. These manors and premises continued part of the possessions of the Priory of Christ Church till the dissolution of it by King Henry VIII., when it was surrendered into his hands. This king, on April 1, in his thirty-second year,

granted this manor to Sir George Brooke, Lord Cobham, and it remained in his family till Henry, Lord Cobham, was attainted of high treason in the first year of James I. It was afterwards granted to Sir Robert Cecil, Earl of Salisbury, K.G. (son of the eminent statesman, William, Lord Burleigh), and who had married Elizabeth, sister of Henry, Lord Cobham, aforesaid.

The village of Cliffe was formerly much larger than it is at present; part of it was burnt down by a casual fire that happened here in 1520, which disaster, says Lambarde, it has never recovered. The church, which is dedicated to St. Helen, is a large and handsome building equal most in the county. It consists of two side aisles, a nave and chancel, and at the west end is a good tower in which there is a clock and six bells. In the chancel are remains of painted glass, and in the roof are the arms of Archbishop Arundel. Here are likewise six miserere stalls, formerly for the use of monks of Christ Church when they came to visit their possessions in this parish. Cliffe was one of the earliest possessions of Christ Church, Canterbury, and was retained by that monastery till the Dissolution. It was excepted in the great deed of exchange which Archbishop Cranmer made with King Henry VIII., by which he conveyed all the rest of his estates in this parish to that king. The Archbishop of Canterbury still continues patron of this rectory. The brasses are—Thomas Faunce and wives and children, 1609; Bonham Faunce and wives and children, 1652. In the nave and north aisle are sepulchral slabs with short inscriptions in Norman French, of the fourteenth century. An ancient silver gilt paten, enriched with blue and green enamel, and having in the centre a representation of the Trinity, is preserved among the Communion plate. It is of the time of Edward III. Some beautiful sedilia on south side of sacarium and a piscina, and there are some ancient paintings on the east walls of the transepts. In the north one the Martyrdom of St. Edmund is represented with arcades, borderings and floral devices; it is supposed to be of late thirteenth century. In this transept there are still some masonry patterns. In the south transept the Day of Judgment is depicted. There is a fine carved pulpit of 1634. A list of the rectors of Cliffe, commencing with William de Witlesey, 1350 (afterwards Archbishop of Canterbury), is given in Hasted's "History of Kent"; among them is Edmond Cranmer, Archdeacon of Canterbury, 1549, and brother of the archbishop; also Hugh Weston, 1554, who became first Dean of Westminster.

Such are the records of the historic places we have visited to day, places that have played such very important parts in event and epochs in the history of our dear old country of England and which have greatly contributed to making it the proudest mother country of so many nations.

#### THE NEW YORK STEEL BUILDINGS.

AN interesting series of papers on "America at Work" is now in course of publication in the *Birmingham Daily Post*. The following is the author's description of the latest manner of building in New York:—

New York is a vortex of rebuilding. A contractor told me ten years is the life of a building in New York. In ten years it has not crumbled or bulged, nor does it look different from the way it did when first built. But it has become antiquated. It is only twelve storeys, a mere barn in height, and the proper height now is anything from twenty to thirty storeys. Its lifts, elevators, only go three times as fast as they do in England. Besides, there are not enough of them, and they stop at every floor. What is wanted is a system of many elevators to provide for local traffic, and express elevators that do not stop lower than the eighteenth floor. I have had pointed out to me a good hotel, built only eight years ago, with what are called all the most modern improvements. It is being pulled down so that a building twice as high may be erected.

"You English," said a man to me, "use a thing till it becomes useless. We Americans only use a thing till we get something better. It doesn't matter how good it is or how much it cost; we scrap-heap it."

Building in New York has ceased to be a thing for architects and masons. It has become a thing for engineers and riveters. The stone used is only a clothing to the skeleton steel.

The rage for steel frame skyscrapers has struck New York as the measles strikes a school of youngsters. Seven years ago American architects agreed that to put a building higher than sixteen storeys was to step into the region of danger. But that was seven years ago. Yesterday afternoon I smoked a cigar by a window on the twenty-ninth storey of the Park Row Building, absolutely the tallest block of offices in the world. Broadway far below was but a strip of ribbon, and people were like ants. The pyramidal Statue of Liberty guarding New York Harbour was reduced to the proportion of an ordinary-sized woman. The Cunard liner the *Campan*

in which I crossed the Atlantic less than a week before, was the size of a sixpenny toy boat. That will give you an idea of the height.

The offices on the top storeys of the Park Row Building never have any of the city dust, and flies, a plague in summer, never reach so high.

It is not alone eagerness to go half a dozen better than anybody else that has produced the present rivalry in erecting mammoth skyscrapers. New York is on a long island of rock, the business part of the town is the lower and narrower end, every inch is occupied, as New York is wrestling from London to itself the centre of the world's money market, and it cannot expand outwards; it has to grow upwards. The concentration of vast commercial interests has caused an enormous appreciation of land values. In the Wall Street neighbourhood ground costs about 60¢ a square foot.

To build on the English plan, with huge foundations, stout masonry, and only some five storeys high, would mean enormous rents, and the pushing of smaller firms "up town" out of the business area.

Americans must be "right there" within five minutes of everywhere. Accordingly engineers are now house-builders, piling up structures of little foundation, no width, no waste space in thickness of walls, but enormously high and providing a town of offices under one roof. Take the Flatiron. On each side of its twenty storeys are seventeen offices. Allowing an average of five persons to an office, you get a population of 1,700 business men.

The rebuilding of New York is not individual enterprise. Here are companies that have taken the work in hand. The Standard Oil Trust have several fingers in, and they are about to join blocks of buildings worth 11,000,000¢ by an arcade 30 feet long. The principal building firm is the Fuller Construction Company, with a capital of 12,000,000¢. The way it works is on this plan:—It fixes its eyes on a building of eight or ten or twelve storeys in a good business district. The owners are approached, and where they have been reaping per cent. or 4 per cent. from their property they are promised per cent. or 7 per cent. if they hand it over to the construction company, with the option of buying the new building at a certain price. They agree. Down comes the ten-storey building and up goes one of twenty or more storeys. Then a company is started to buy the building from the Fuller Construction Company, and the Fuller Company having "made a good thing," plunge into fresh operations. The Fuller Company never continues to own. Its work, with so enormous a capital, is to get hold of every block it wants, rebuild and sell out.

I went over four or five of these typical American buildings, with no style of architecture about them but the skyscraper style. They are not beautiful. You need not tell the American that. If you do, he will retort, "They were not put up to look pretty. They were put up to make money. They're doing what they were put up for. Guess you've no fault to find with that."

"Push!" is the motto of all engaged in building skyscrapers. I never saw a man dawdle. There seemed honest haste in everyone. I stood by the hour watching and talking and noting the haste. Most of the workers were men about thirty years. They were spry and elastic, and their wits were at the dance. If there was a check a man would halt, squirt bacco juice between his teeth at the adjoining wall and say, "Guess we'd better do it the other way." In an instant a fresh start was made.

The rock on which New York stands has a billowy surface. In places the rock is on top, and in others it lies under a cup of quicksand and hardpan. First caisson foundations are put in—large steel tuns, to get a flat-footed bottom in which the steel columns that will bear the strain of the framework will be fixed in concrete. When the rock is near the surface work begins to get away. If, however, there is quicksand to be got through there is delay. The excavating is done in air-tight chambers, and when bottom is reached concrete is laid; it hardens in twenty-four hours, and then the caisson can be fixed. Forty feet of quicksand and 12 feet of hardpan have been cut rough in seven days.

To put up a ten-storey building in a year was thought not long ago excellent progress. Not to be able to put up a twenty-storey building in six months is now thought evidence of slackness. To climb two storeys a week is the usual progress.

There is no waiting till the skeleton is complete before covering it with stone or brick. As soon as the engineers are a storey ahead the masons and bricklayers come along.

In the finest buildings the bottom storey has often a shell of granite or marble, and the upper storeys local white stone. Should there be a delay with the granite or marble, that means a delay with the casing higher up. Each storey bears its own weight of stone and brickwork. So you frequently see the stone encasing to the fifteenth and sixteenth storeys, the building complete and the windows in, while the twelfth, thirteenth and fourteenth storeys are nothing more than open

ironwork. To look at a mighty building half completed, and that half the top half, brings rather a jerk in the breath.

Only at first do you think the flimsiness must mean weakness. The scheme of the distribution of weight is scientific and mathematical. Each column is designed to bear a specific load, sometimes as much as three million pounds, and they have box-shaped flanges at each storey to bear the weight of the masonry. All through are steel braces to get lateral stiffness. The steelwork is protected by fireproof bricks, so in the event of a conflagration the steel will not warp. The floors are usually terra-cotta arches, laid in cement and covered with cinder concrete. The idea is to keep a fire confined to the storey in which it originates.

In several of the buildings I visited the lower floors were ready for occupancy—except for some plastering—long before even the steel skeleton was completed. Bricklayers trod on the heels of engineers, carpenters and plumbers followed bricklayers, and by the time the last bolt was being driven on the twentieth storey the office furniture was being moved into the first. The rent is calculated by the square foot of office room. In the Wall Street district you will pay 17¢ per month per square foot on the ground-floor. The average cost, however, for an ordinary three-room office of medium size about the centre of the building is 15¢ a month.

The objection that springs into the mind of the Englishman is that, as British towns are often built on clay, the steel frame could have no certain hold as when on rock. The answer is that in Chicago some of the loftiest blocks "float," as it is called, on clay. There is delving for 20 or 30 feet, and by compressed air the water is kept back. Then a concrete bed is laid. On this the caissons are put as though it were rock, and they are embedded in concrete, and the weight of a twenty-storey building will only sink the concrete into the bed of clay a couple of inches.

The highest block in the world, the Park Row Building, 382 feet, has thirty storeys, and thirty-two if the couple of rooms in the cupola are counted. It has a frontage of 103 feet, so that it is nearly four times as high as its width. The skeleton alone was 9,000 tons of steel. Yet it does not stand on rock. It rests on 3,500 spruce trees, with their bark on, 25 feet long and 12 inches in diameter, driven 24 feet into sand, and the remaining 1 foot flushed level with concrete. I looked up the side of the building, and though there were millions of bricks, it looked all as smooth as a plate of polished steel.

It is in buildings like these that New York commerce throbs. Here men, coatless, vestless, sit in their shirts, and with their sleeves rolled up. They are kept cool with a movable electric fan. They smoke green cigars. There is a movable telephone at their left elbow, and a typewriter on their right hand. They are mostly young men, tall, well built, and with nervous eagerness in every line of their clear-skinned faces. They drink iced water. Of course, they drink other things, but the American business man is a water drinking person. He hustles. Still there is often more hustle than haste. He will stand cursing for thirty seconds at the non-coming of an elevator to take him to the floor below when he could run down in fifteen seconds.

There are 7,000 elevators in New York, and they carry more than a million passengers a day. They are fast—six times as fast as English lifts. When I inspected the Park Row Building an apology was made to me that they were not the swiftest in New York.

But picture this: You go into a heavily marbled hall full of men in lounge suits and straw hats stuck on the back of their heads. In the centre is a half-moon of caged doors. Over them you see notices "Local," "Express to Thirtieth," and the like. There are two electric lamps above each door, and they alternately light up, showing the words "Up" or "Down." Over these again is a dial, and the dial is curving to and fro. You give one glance and you understand that No. 8 elevator is at the seventeenth storey, and that it is coming down. In case you are too busy to look you can hear a man, with a twang like a broken piano string, shouting "Local car on the right just coming down; express in the centre, no stop till the thirteenth floor; express to the twentieth on the left, then stop all floors; local between the thirteenth and twentieth floor there." And all the time those eight cage-doors are clatteringly opened, and they throw out crowds of men, and other men jump in and are shot, as from a cannon, skywards.

On each floor are the twin electric lamps "Up" and "Down," and over each elevator swings the hand on the dial. You know there just as well as on the ground floor where all the cars are, and you signal by pressing a button. An elevator will drop from the twenty-eighth storey to the floor with no halt unless there is a signal to stop. The descent makes you feel the bottom had fallen out of the world.

The constant rising and dropping affects the elevator men. They generally have to cease the work because of shattered nerves—that is, if they do not die suddenly from heart disease. Every elevator man gets disease of the heart!

## IMPERMEABLE MASONRY.

THE increasing demand for masonry to be employed in resisting the pressure of water in structures where the duty to be performed is trying, has made prominent the desirability of obtaining, if possible, concrete or other masonry which shall be impermeable to water. Civil engineers of extended experience in masonry construction, says the *Engineering Record*, realise how little ordinary masonry can be relied upon as a water-tight material. This is not denying that considerable quantities of concrete and rubble masonry have been constructed in dams which are essentially impermeable to water, but of the total mass of masonry structures in engineering work it is doubtless safe to say that but a small part is actually water-tight. In many places this is a matter of no consequence, the principal end to be attained being the preservation of the masonry mass in proper form and with proper carrying capacity. In other cases many an engineer would have been saved much apprehension, not to say anxiety, if he could have felt confident that his masonry would successfully carry the pressure of water without material loss. All masonry composed of natural stone laid in mortar is more or less porous, and however well made it may be that sensible absorption of water will take place; but this is not leakage.

The pages of the "Transactions" of the American Society of Civil Engineers, as well as much other engineering literature, give evidence of the desirability of attaining, if possible, impermeable concrete or other masonry for many purposes. A number of investigations have been made by Mr. George W. Rafter, Messrs. SooySmith & Co., and other investigators at one time or another, some of the results of which have been made public and others have not. Experimental work has also been done in this direction for the Metropolitan Water and Sewerage Board of Boston under the direction of Mr. F. P. Stearns, chief engineer. Finally, a number of tests as to the impermeability of gravel concrete of different proportions, under pressures of water ranging from 20 to 80 lbs. per square inch, have been made during the current year at the Thayer School of Civil Engineering, the results of which have been published as the thesis work of two of the graduate students, Messrs. McIntyre & True.

Throughout all these investigations, so far as they have been published, there has been a careful recognition of the necessity of sufficient mortar to fill the voids of the broken stone or gravel used in the concrete, but there seems to have been scarcely sufficient attention directed to one or two other essential qualities of the cement for the attainment of impermeability in the final mixture. Obviously it is essential that there should be sufficient mortar to fill the voids of the gravel or broken stone, those voids depending largely upon the method of preparation or selection of the broken stone and the variation in size of the stones of which the gravel is composed. In the past it has been almost universal practice so to prescribe the broken stone as to exclude the smaller sizes and make the voids from 40 to 45 per cent., or possibly 50 per cent. of the volume. Under such circumstances so small a volume of mortar as 30 per cent. of the total of broken stone would clearly fall far short of producing a water-tight mixture. Mr. Rafter was therefore judicious in specifying 40 to 45 per cent. of the volume of the aggregate for the mortar employed in his concrete. It may even be doubted whether 40 per cent. of mortar would always fill the voids of the broken stone, as the latter is usually prescribed. The voids of gravel, unless the smaller stones be excluded, will seldom exceed one-third of the volume, and hence 30 per cent. of mortar would usually fill the voids of such gravel.

As has already been intimated, however, it is not necessarily sufficient to employ a volume of mortar that is equal to the voids in the broken stone or gravel. The mortar is composed of certain portions of sand and cement, the voids of the sand itself sometimes exceeding 40 per cent. of its volume. It is just as essential to fill the sand voids as those of the broken stone or gravel. In order that voids of the sand shall be so filled as to produce impermeability, it is further requisite that the cement shall be ground fine so that the operation of setting, *i.e.* of crystallisation, shall leave no voids of sufficient size to permit water to find its way through them. It is not to be supposed that the operation of crystallisation which takes place in the setting of the cement will make that portion of the mass between the sand grains absolutely solid, but the interstices must be reduced as nearly to those of molecular dimensions as possible if the resulting mass is to be impermeable under sensible pressures of water. The question of fine grinding of the cement, therefore, is thus seen to play a most important part in the attainment of a watertight concrete. It is not sufficient that the cement as such shall be of excellent quality, but it must be ground so fine that after it is set there shall remain no spaces large enough to permit water to find its way through under pressure.

It is coming to be recognised more generally among civil engineers that the exclusion of the smaller sizes of stone from crushed rock in the making of concrete is unwise from the

point of view of both economy and carrying power of concrete, and in some kinds of stone at least it appears to advantageous not to exclude the crusher dust. It is obvious certain from the considerations which have been set forth that this balancing of broken stone has the further valuable result of aiding materially in securing impermeability of concrete or other masonry. The presence of the smaller fragments of broken stone as well as the dust will clearly aid in an efficient manner in closing any possible channels through the completed masonry, and the same observation holds in precise the same way in connection with balanced gravel containing the varying sizes from ordinary sand to the largest single stone permissible. Indeed, so essential a part does this balancing of broken stone and gravel play in securing watertight masonry that it is reasonable to suppose watertightness might be attained in concrete with sensibly less finely ground cement than were that balancing omitted. The use of the total products of the crusher as well as the naturally balanced gravel carries with it in this manner both its own economy and that of a less finely ground cement, while at the same time aiding in reaching the desired quality of impermeability.

In all experimental investigations, therefore, on the permeability of concrete it is absolutely essential, in order that the results may have their proper values, that the degree of balancing of the broken stone or gravel be determined and given as well as the fineness of grinding of the cement used. In these respects the data at present available in this particular line of work are far from complete, and in many cases so incomplete as to detract materially from the values of the results, if, indeed, that value is not sensibly destroyed. It is of little significance to state that the amount of mortar employed was 30 to 45 per cent. of the volume of the aggregate, if the size of the broken stone or gravel employed and the fineness of the grinding of the cement are ignored. The voids of the form may be reduced possibly to 15 per cent. and easily to 20 or 25 per cent. of the total volume with reasonable balancing, while otherwise the void space might reach 40 or even 50 per cent. of the total volume. It is clear, therefore, that 20 or 25 per cent. of mortar in the one case might answer all the purposes that 40 or 45 per cent. could in other cases. Similarly, the significance of No. 1 cement or No. 2 cement is equally indeterminate, whatever may be the rate of setting or the resistance of the mass after setting without the fineness of the material being known.

So far as experimental results now available indicate would appear that in order to attain impermeability in concrete whether of gravel or of broken stone, that the mortar mixture must be at least as rich as 1 cement to 2 sand, or 1 cement to 2½ sand, the proportion of mortar being sufficient to fill entire the voids, or possibly a little more than that in order to provide for inequalities of mixing in different portions of the mass. Although apparently mortar of 1 cement to 3 sand has occasionally been found impermeable under as high pressure as 40 lbs. per square inch, there is little evidence that such a mixture can in general be relied upon. In addition to the importance of these matters of composition to be employed for a permeable concrete, it is undoubtedly also of essential importance that the concrete should be kept thoroughly moistened during the entire period of setting, otherwise not only the ultimate resistance may be impaired, but also the impermeability by the slight contraction of setting in air which has been observed repeatedly. This has a marked influence upon the use of concrete in the walls of buildings, which in their subsequent experience may be exposed to driving rain storms, against which ordinary walls of masonry have frequently been found ineffective.

## THE TOWN OF RICHELIEU.

A CORRESPONDENT of the *American Architect* gives the following account of the town founded by the Cardinal, which is rarely visited:—

Richelieu lies in the midst of a barren plain some distance from the modern railroad station. The present approach to the city is dull, uninteresting, prosaic; but when, once we stand at closer range, under the shade of the old alleys of trees surrounding the city walls, the imagination runs riot. Nothing is changed—the old moat is still half-filled with water, and the quaint towers for the mousquetair defenders still retain their loopholes, while the city gates, though now without their drawbridges, are charming architectural compositions.

One can fancy the interest with which the grim old Cardinal planned this toy city. The impression is of a scene in a theatre, and one would not be in the least surprised to see His Eminence drive out, or D'Artagnan and his companion loitering in the archway. Every view affords a setting for the characters of Dumas.

Standing at the principal entrance we can see down a clear vista through the heart of the city the corresponding gate of

opposite side. It seems but a stone's throw away, and, indeed, is but a thousand paces.

There is no thought of radial avenues, the whole city being laid out on a simple rectangular plan. The extreme length measures about 960 paces, and the width, 360 approximately. The principal street is on the main axis, with two minor streets parallel to it. These, together with three shorter transverse streets, two of which traverse the two public squares, form the arteries of the city.

The houses are all alike, except that the buildings on the street corners are a storey higher than the others. The streets are not long enough to make this arrangement look too monotonous, but are, at the same time, sufficiently long to make the public squares the centres of interest. These squares are planted with trees in the most approved Republican manner, seen everywhere in France.

The houses, except the corner ones mentioned above, are three storeys high, in the familiar Henri IV. style, with stucco quoins and high slate roofs broken by dormers. The cornice line is brought down lower on the buildings around the public squares, making half-dormers of the upper storeys. This makes the cornice line of the squares lower than that of the principal street.

The church and market are the most conspicuous buildings, the church being of a seventeenth-century Jesuit type, and the market a picturesque but unpretentious structure.

The ground on which the city is built is perfectly level, with sufficient fall to the streets to drain everything to the centre of the town.

Richelieu was founded in 1631, some ten years after the commencement of the neighbouring château in the park of His Eminence the Cardinal Duc of Richelieu.

It is said that the Cardinal began this princely dwelling because he was envious to surpass the Châteaux of Champigny, Veude and Bonnavet in this same province of Poitou. Whether His Eminence was guilty of jealousy or not, the fact remains that, through his political influence, the château of Champigny, the heritage of the famous Mademoiselle de Mompensier was demolished. He attempted to tear down the chateau as well, but was defeated in this purpose through the intervention of the Pope. The histories give this affair as preliminary to the erection of his own château, and then proceed to mention the employment of 2,000 workmen upon his palace gardens. The men were under the direction of another cardinal, François d'Escoubleau de Sourdis.

Richelieu's architect was also the king's, Jacques Lemercier. The problem given to him was to preserve in the magnificent buildings, of which the Cardinal had conceived the plans, the plan in which His Eminence had been born—to permit, in other words, the ministerial pride to view at pleasure the contrast between the splendour of his old age and the humbleness of his beginnings.

That this plan was detrimental to the arrangement of the interior of the château, all of its admirers have agreed; but although the building was not a model of convenience, it was a veritable treasury of art. Decorated by Poussin and LeVost, it was filled with the antiquities which Mazarin, a simple abbé, purchased in Italy, a collection to which the Moorish Jew, and the most celebrated merchant of antiquities of his time, contributed no small part.

In 1642 the château was finished. In 1631 the Cardinal obtained letters patent, authorising him to found, adjoining his château, a city to bear his own name. He agreed to institute fairs a year and, in order to facilitate access to them, dug a canal from the Vienne.

In 1639, probably at the Cardinal's request, the Pope suppressed a neighbouring cure and installed it here. It was served by the priests of the Mission of St. Vincent de Paul. Lemercier gave them a church and a charitable hospital.

For the civil administration of the new city, the Cardinal appointed various magistrates and officers, who were each obliged to build his own house at his own expense and, as it was, according to Lemercier's designs.

The city was walled, a market and auditorium constructed. In 1633, the twenty-eight houses of the main street, four on each side, were nearly completed. The Cardinal's superintendent, De Sourdis, wrote to him:—"The houses of the principal street are marvellously advanced and they are the finest things in the world to see. It lacks only five houses to finish it."

Finally, to complete this ideal city of the Renaissance, the Cardinal decided to build an academy and obtained a charter for the establishment of a Royal College.

He had hoped to have the king visit it, but it is said that himself was so occupied by politics that he died without having seen the completed city on which he had expended so much money and so much thought. Indeed there are on record only two visits of the Cardinal to his château.

At Richelieu's death the château passed to his family. The duke was an emigré, and in 1793 the château was condemned. In the year XI., however, the duke's name having

been eradicated from the proscribed list, the château was restored to him, but he feared to return to France, and sold the building to speculators, who immediately began to demolish it for the stonework. Napoleon made an attempt to purchase it for military purposes, but was unsuccessful, and to-day there are few farmhouses in the district which have not been repaired or constructed with the stonework of the château. The collections are scattered all over Europe.

As a city Richelieu is a failure. It remains as it stood at the time of the Cardinal's death, with buildings unfinished and even the escutcheons on the completed buildings uncarved. Not a single house has been added, and only the establishment of the cure and the building of the church have saved the city from desertion.

The Cardinal had not considered the real factors in the growth of cities, and the attempt to establish a business community at a point which was neither on a navigable river nor a great trade-route was, of course, predestined to fail.

To-day the only sounds that greet the ears in Richelieu are the noise of one's own footsteps and the splash of the water in the fountain of the public square. The only traces of inhabitants are, here and there, white-bonneted peasant-women knitting in a courtyard or a couple of peasants drowsing in front of a café.

Thus the little city all but deserves the name that has been given it—it is called the "Pompeii of France."

## DISCOVERIES IN MEXICO CITY.

THE unearthing of the remains of an Aztec temple in the city of Mexico last winter promises to shed much additional light upon the ancient capital of the Aztecs. The discovery was made in the heart of the city, only two squares east of the great plaza, or Zocolo, and constitutes one of the most important archaeological discoveries made in recent years. In addition to the temple several huge monoliths, stone idols, incense-gum, spear-heads and other interesting objects were brought to light.

Some years ago, says a correspondent of the *Scientific American*, the eminent archaeologist, Señor Batres, of Mexico, projected a map of the city of Tenochtitlan as it existed in the year 1519 when first seen by the Spaniards. This map represented the city as an island intersected with canals running nearly at right angles corresponding to the streets of the present city. He located on the map the various temples and public edifices of the Aztecs, all of which, of course, had been destroyed by the conquerors. Back of the great temple, or Teocalli, which occupied the present site of the cathedral and major portion of the plaza, he located a temple called Coateocalli, meaning the house of many gods. He gave as his authority for locating this temple, Padre Duran, who wrote that the temple existed on the site occupied by the property of the Acevedos. Searching the archives, Batres found among the records in reference to an ordinance regarding the supply of water, under date of October 27, 1710, that the property referred to was on the corner of Relox and Cordobanes Streets, and consequently gave that as the locality of the temple of many gods, but as the corner was occupied by a fine old building, it was not supposed for a moment that any remains of the ancient temple could possibly be in existence.

Last winter the work of renovating or practically rebuilding the old palace occupying this corner was undertaken, for the purpose of furnishing suitable quarters for the Department of Justice. Captain Diaz, the son of President Diaz, was given charge of the work, and it is due chiefly to him that the discoveries were made. While the workmen were levelling off the patio, or central courtyard of the edifice, previous to putting down a new pavement, they came in contact with a hard solid foundation which proved to be a flight of stone steps going down into the earth. They would probably have covered them up again, and levelled off the projecting one at the desired height, had not young Diaz come along just in time.

Diaz ordered the men to keep on digging, cautioning them to use their tools carefully, and, following a line parallel with the steps, a trench was opened the entire length of the patio. At the further end of the trench, scarcely 2 feet below the surface, the men struck what appeared to be a round polished rock, around which they carefully worked, pulling the dirt out with their hands, till they had disclosed a monolith weighing several tons, representing a tiger recumbent, or ocelotl, ready to spring. A rude derrick was rigged up, the sculptured rock hoisted out of the hole, and it was weighed and measured.

Further excavating brought to light another rock sculptured to represent a serpent's head, which corresponds with two others previously discovered, and which were the corner pieces of the great wall enclosing the great Teocalli, within which are said to have dwelt 7,000 Aztec priests. Besides the great pyramid rising in the centre, upon which they made their human sacrifices to the war god, there were seventy-eight

chapels devoted to the worship of special deities. After the two huge monoliths were removed from the excavation, the digging proceeded and the dirt carefully removed, every object found was cleaned and put aside for the inspection and study of Señor Batres. The foot of the steps was finally reached at a depth of 13 feet below the level of the present city of Mexico, where they rested on a solid base or foundation of masonry, which was without question the level of the old city of Tenochtitlan; consequently the present city of Mexico must be some 13 feet above the level of the original city, which presents an interesting problem to the archaeologist.

At the foot of the steps many of the smaller objects were found, such as idols, remains of idols, incense-gum, spear-heads and ornaments, just as they had been thrown down by the Spanish conquerors. The stumps of two trees growing at the foot of the temple were also uncovered. These trees had evidently taken root after the destruction of the temple. They were found at irregular distances from the steps, and had the appearance of having grown spontaneously, just as the trees are growing at the present day out of the ruined walls of Palenque, and other aboriginal cities.

The recumbent tiger or ocelotl weighs 4 tons. It measures 2 metres 30 centimetres long, 1 metre 5 centimetres wide and 94 centimetres in height. Its mouth is open, showing huge teeth and a part of its tongue, and great round eyes give it a ferocious look. It is well modelled, with the tail properly curved around on one side as the animal is often seen in life. On each side of the head is a mane resembling somewhat the pendant part of the head-dress on the Egyptian Sphinx. On its under side are vestiges of paintings showing that it was originally painted with red and yellow to carry out more perfectly the idea or imitation of the American tiger. Cut in its back is a cylindrical cavity about 18 inches in diameter and 5 inches in depth. The sides and bottom of this cavity are sculptured with representations of Aztec figures or warriors.

The serpent's head, identical with the other two already discovered, represents the serpent with its mouth open and the upper lip rolled up over its forehead, disclosing the upper jaw with great tusks projecting down over the under lip. It is supposed that there were four of these heads, one in each corner of the great wall, and the design corresponds to similar heads graven on the Aztec Calendar stone. On the under surface of the heads Batres has deciphered a hieroglyphic which he calls "tres acatl," the date of the foundation of the Great Teocalli.

Among the other relics unearthed was a curious little idol cut out of a dark porous stone, about 10 inches in height. The workmanship is rather crude, but decidedly interesting, representing a head with scarcely any body, perhaps in a sitting posture with arms folded. The incense-gum, upon being removed from the earth which had surrounded it for centuries, resembled pieces of bone, but when, by the simple application of a lighted match, it burned and gave off the proper perfume, it was proved to be incense.

A number of stones were fashioned in the shape of skulls or death heads, with projections at the back as though they had been inserted into a wall. Some of them were painted white, which gave them a more horrible aspect. A very interesting relic was a piece of baked clay, a part of a foot of a colossal statue. The toes were perfectly modelled, showing the edge of the leather sandal beneath and the knots of the thongs holding it over the instep, as worn at the present day by the native Indians. Other smaller pieces of this same statue were found, and in handling them one could imagine the great war chief in full regalia, guarding the portals of the temple when set upon by the Spaniards and hurled down the steps to the bottom.

All the objects found are to be preserved in the National Museum, and it is proposed by Captain Diaz to leave the patio with the excavation open, showing the remains of the temple. The very interesting question now arises, How is it that the present city is 13 feet above the old one, as shown by the excavation?

#### CORONATION MEMORIAL, STAMFORD.

THE selected design by Mr. J. C. Traylen is monumental in character, of free Classic architectural treatment. The lower part is circular in shape, and stands upon a spreading base, which may be used as a seat approached by steps. The upper part is octagonal, having deeply recessed, arched and cusped panels on the four cardinal sides, divided by attached shafts at the angles, from the caps of which spreading foliage springs and fills the spandrels up to the cornice. A truncated termination is carried up above the cornice, upon which is fitted an elaborately wrought crown of iron, bronzed by an imperishable process. The crocketed ribs and the centre termination of it will form suitable attachments for the electric light. The total height from the pavement to the top of the arc light will be 20 feet. The materials of its composition will be granite, marble, bronze and iron.

The intention is to show that King Edward VII. was crowned on a certain date, and that at this time peace was concluded in South Africa. A bronze panel on the south side towards Ironmonger Street will set forth these facts. Above will be the arms of the King, highly emblazoned in color and gold by enamel, on copper or vitreous mosaicwork. On the east and west cardinal panels, respectively, the arms of Edward IV. and William Browne are introduced in rich wrought stonework with bronze panels setting forth the historical and worthy connection with the town. These panels are connected all round with cornucopiae garlands.

Especially in the case of Edward IV. may we quote Shakespeare, that after "the winter of our discontent," "our bruised arms are hung up for monuments," in commemoration of the battle fought for him by Stamford men at Losecoat Field, and of his grant of arms to the town. For similar reasons, in the war just concluded honoured space on this memorial is given for the names of the Stamford Volunteers who took part therein, in the north panel, beneath palms of victory and emblems of peace. And in this Crowning and Peace (according to the inexorable law and circle of destiny, as in the movement of heavenly bodies, the circle of the prismatic spectrum of colour, the circle of sequence of the chords of music, and the once-a-man-twice-a-child circle of our own lives) Peace will bring Wealth, Wealth will bring Pride, Pride will bring War, War will bring Poverty, Poverty will bring Humility, Humility will bring us round again to Peace. This legend, the keynote of the deeper intuition of the monument, will be imperishably graven on a belt encircling it, as a lesson for all time.

#### COLONSAY AND ITS ARCHEOLOGY.

THE islands of Colonsay and Oronsay, writes a correspondent of the *Glasgow Herald*, have attracted the attention of rovers and settlers from the very earliest times. Pleasing in outline, the islands possess bays and gray stretches which tempt the wandering seafarer to disembark. Yet to most Scotsmen Colonsay and Oronsay (which are at low tide) remain mere names, and for every 100 visitors to Iona we may safely say that a single pilgrim penetrates to the Priors ruins of Oronsay to view the ancient cross, unrivaled for beauty, and the large group of early sculptured slabs. Columba halted here on his way Iona-wards, and during succeeding centuries Norsemen lived and died on the islands. Some of their graves have in recent years been examined and found to contain horse bones and trappings. The dead Viking was interred also with his boat, his sword, shield, lance and axe, and utensils of gilded bronze and iron; while the good wife reposed in her last slumber with her cooling utensils, bronze brooches, and ornaments of amber and ivory ready to her hand. Probably during the wanderings of the Norse raiders of the ninth and neighbouring centuries, these islands were the scene of occasional strife. It is even now certain that during the still earlier centuries of the Christian era Colonsay saw many a tussel and more fighting and alarms than other Hebridean islands many times its size. Of this we can judge by the unusually large number of fortified hill tops. Among the "Duns" occur Nan Nighean, Meadhonach, Gallin, Domhnuill, Gibhinn, Caltaig, Cholla and Avain. Some of these are of large size, and the drystone masonry is still in good preservation. We know deplorably little of the history of these things, but the spade, scientifically applied to the green turf and protecting mould, would soon reveal many secrets.

It is curious in this connection to consider how much money leaves Britain yearly to be expended in exploratory work in Palestine and elsewhere in Asia and in Africa: yet so vast an amount of work of like character remains to be done at our very doors, with scarcely a beginning made. At the north end of Colonsay, and above high-water mark, are several spacious caves with passages and chambers. Accumulations many feet thick of shells only of edible shellfish, split bones and fire-fractured stones burden the floors, and tell of the human occupation of these shelters. The topmost layers of debris are, no doubt, modern, but the deeper strata may date back to very early times. Research here would find reward. The caves can be inspected only by artificial light, as daylight soon disappears as one penetrates inwards. Other interesting features of the islands are the old raised beaches, composed largely of yellowish sand, the result, of course, of rock denudation during a remote age. In several places on the islands occur stretches of sand of quite another kind, being absolutely white, the result of a curious process of a less remote period, the comminution of countless shells of land snails which for thousands of years have fed and died on the green turf. The brilliant colouring at times of these sea near Colonsay and Iona is largely to be accounted for by the presence of this pure white sand on the sea bottom. Thus the lowly snail has rendered the Hebridean seascape at times brighter than any similar colour-effect obtainable on the Mediterranean. Belonging to a period earlier

in the forts referred to are several monoliths and a circle of standing stones, but to a still earlier era belongs the shell mound in Oronsay, known as Caisteal nan Gilleann, not improbably one of the oldest known sites of human habitation in Scotland. The hillock stands isolated and prominent on the stony undulating grassy surface of Oronsay. The mound, some 30 feet high, is, like all the neighbouring area, composed of blown sand from the ancient raised beach. The top (before exploration by the late Mr. Galloway) was thickly covered with an enormous quantity of shell debris. Surprise has been expressed that, even in summer, such an exposed and inconvenient spot should have been chosen for what must have been a prolonged occupation, or series of occupations. I believe, however, the camping ground was originally on the ground, or very possibly in a hollow, and that during the centuries since the abandonment of the site the level of the surrounding sandy areas has been lowered by the blowing away of the soil, thus leaving the mound high and dry with its impenetrable and protective top quite intact and undisturbed. The relics obtained from Caisteal nan Gilleann are of the most interesting character. They consist of implements of stone, bone and horn, chiefly round-nosed, chisel-ended instruments. The end is rough (in which was inserted probably a handle of wood or horn), and the other bevelled and very smooth, as if the article had been employed for rubbing purposes, such as the preparation of skins. Several of these implements were discovered this year, as also many of the so-called anvil-stones. Bone pins or borers have been found; but the most important discovery of all took place many years ago, when eleven barbed harpoon heads, or fish spears, of bone were found. These were exhibited at the Fisheries Exhibition in London by their discoverer, the late Mr. Galloway; but before they could be submitted to various experts they disappeared, and their present whereabouts cannot be traced. Harpoons apparently similar have been found in Kent's Cavern, Devonshire, in association with implements of palæolithic type. Palæolithic harpoon and spear heads have been found on the Continent, at several continental and a Yorkshire specimen may be attributed to neolithic times. It is important to have the Oronsay specimens recovered and a comparison of them made with the examples above mentioned and with the specimens recently found in caves at Oban. From the standpoints of archaeology, natural history and geology the islands in the West to which our King and Queen have just paid a visit are well worthy of study and investigation.

### McKINLEY MEMORIAL.

COMPETITION has been arranged, of which the following is the programme, for the competition for the McKinley Memorial, Philadelphia:—

It is desired that the memorial shall include a portrait statue of President McKinley, with a suitable architectural setting.

The site selected is the point of ground in line with the centre of the window of the eastern pavilion of Memorial Hall, Fairmount Park, immediately opposite the eastern avenue of the Welsh Memorial, facing the roadway which extends from the Smith Memorial Gateway, westward. The general committee, however, reserves to itself the right to change the location should such action be found necessary.

The competition is open to any sculptor, without restriction as to citizenship or nationality.

Designs shall be in the form of sketch models in plaster at a uniform scale of 1½ inch to the foot. A type-written description of the design and material shall accompany the sketch-model. A competitor may submit more than one sketch-model.

The designs will be received at the office of the Secretary, 30 South Broad Street, Philadelphia, by whom they will be carefully arranged for inspection by the jury of award. All expenses of delivery of sketch-models must be prepaid by the competitor. Upon request by competitors models will be returned to them "collect." Those belonging to competitors outside of Philadelphia will be placed in the care of a responsible packer.

The sketch-models, with the accompanying descriptions, shall be deposited with the secretary, as above noted, between February 2 and March 2, 1903, inclusive.

The cost of the memorial, placed in position and complete, shall not exceed the sum of 30,000 dols. This sum shall include the erection of a full-sized model in staff at the site indicated.

The five designs that receive the prizes by the decision of the jury of award shall be publicly exhibited at the discretion of the general committee. The sketch-models submitted and not receiving prizes will not be exhibited or published until after the award of the jury is made public, and then only with the consent of their authors. All models not so retained for

exhibition will be returned, if requested, to the senders within a reasonable time after the announcement of the decision of the jury of award. A copy of the report of the jury of award shall be sent to each competitor.

There shall be a jury of award, composed as follows:—Wilson Eyre, jun., and Theophilus P. Chandler, appointed by the Pennsylvania Academy of the Fine Arts; Edward H. Coates and Charles E. Dana, appointed by the committee on works of art, Fairmount Park Art Association; J. Q. A. Ward and Paul Bartlett, appointed by the National Sculpture Society; Frank Miles Day, appointed by the Philadelphia Chapter of the American Institute of Architects. The jury of award shall examine the designs submitted, and shall report on the same in writing to the general committee, McKinley Memorial, within sixty days after March 2, 1903, as follows:—

1. Selecting the five designs to receive prizes of 500 dols. each, provided that no prize shall be awarded for a design which, in the opinion of the jury of award, cannot be executed for a sum not exceeding 30,000 dols. More than one prize shall not be awarded to any one competitor. The decision of the jury of award regarding these prizes shall be final. Five hundred dollars shall be paid out of the fund of the general committee, McKinley Memorial, to the author of each selected design immediately upon receipt of the report of the jury of award.

2. Selecting from the authors of these five designs the one to be recommended to the general committee for the commission for the entire work, provided the said jury of award decides that any one of these designs is deemed worthy of such recommendation.

No member of the jury of award shall be a competitor. In case of any vacancy occurring in the jury of award, the body making the first appointment shall have the power to fill such vacancy.

Should any competitor violate any of the conditions of this competition or disregard its terms the jury of award shall have power to place his sketch-model out of competition.

Should the design recommended by the jury of award be selected by the general committee, McKinley Memorial, then the said committee shall enter into a contract with its author for the execution of the work.

### HANDICRAFT DESIGN IN IRELAND.

THE revival of handicrafts, which has of late years been so manifest, has unfortunately, says the Baroness Rosenkrantz in the *Irish Times*, not carried with it a corresponding awakening to the danger of bad design. It seems to-day as if many craft workers felt that their goal had been attained when they could successfully manipulate their tools so that no error of workmanship could be detected.

The successful teaching of certain right-minded leaders has worked marked changes wheresoever their influence has been felt; but with the crafts in this country no modern spirit has yet breathed life into the fossilised creed of its design.

If one examines, for example, the designs of a hundred specimens of Irish lace from the best schools in Ireland, scarcely any trace of modernity is to be found, and the designs, apart from being copies and imitations of old designs, are woefully lacking in artistic understanding, and very often exhibit an absolute want of the most elementary knowledge of design and designing. Yet we find, as a rule, that this anachronism of decorative energy is carried out with admirable skill and technical perfection. A mastery of the technique is rightly considered needful, but unfortunately technique in lace, as in most arts and crafts, can be a dangerous foe.

The chief idea of the lace designer seems to be one that should be a secondary consideration, namely, to give opportunities for the display of different stitches. This is entirely a wrong principle, and one which should be speedily deposed. The object of all decoration is to ornament, to adorn; not to show off the skill and learning of the decorator.

It is popularly supposed that designing is the work of artists, forgetting that design or decoration is something far older than any academy.

Primitive man drew designs on his commonest utensils, and the spirit which prompted him is the very same one that should to-day animate us and lead us to decorate according to our present-day fancy the objects which are near and interest us, from a teacup to a lace scarf and a church window.

Unfortunately, we have grown accustomed to dictation; we do not question the intrinsic merit of what we are taught, and consequently we are perpetuating to-day the errors of our forefathers, and have lost the earnestness and sincerity which made them great. What is needed is a revival of the old simple expression of individual feeling, expressed with the enlightenment of to-day. That revival of old forms of expression is not to be tolerated if it be unaccompanied with modern feeling; and here it is that we meet a formidable error now in

danger of being promulgated in Ireland, although as yet it has not affected lace designing.

In the desire to accentuate the characteristics of the Irish nation a strong movement is being made to introduce Celtic design as a decoration for modern objects. Where it is possible to reproduce the feelings, the spirit of the true old Kelt, Celtic design will be in place, but there and there only. It is misplaced upon a Renaissance bureau, and becomes an anachronism unparalleled perhaps in the history of decorative art. It is wrong, and should be impossible for us to shut our eyes to the centuries of design which separate us from Celtic work. Ireland, like all other countries, has passed through the Gothic and Renaissance periods, and stands to-day as far from Celtic art as France does from that of Byzantium.

It is not the object of this article to condemn Celtic designing, but to point out that designers of to-day who are strongly under the influence of this ancient art should be encouraged to gather from it what is best, and what will most rightly harmonise with the spirit of to-day, and not allow themselves to be bound to the servile imitation of an art which was so restricted that no scope was allowed for eventual development. No designer should forget that the art of to-day walks hand in hand with the progress of the nation, and is part of the unending chain to which each successive generation adds a link, each link bearing the hall mark which distinguishes it from others. A servile imitation of a past art has invariably presaged the decline of a nation; never its revival. While fresh adaptations of the eternal laws governing beauty are the sign of health and vigour, imitation is the sign of decadence, the conscious avowal of lack of creative force.

We must be courageous to-day, and remember that as long as we wish to decorate our surroundings the power is in us to do so, and that it is not by slavish copying but by spontaneous and honest efforts that we shall succeed in satisfying our instinctive desire to enjoy what is æsthetic.

Let it not be thought needful that a designer must necessarily be a trained artist in the ordinary acceptance of the term. The careful study of plaster casts and all the routine of the "life class" will be of small assistance to the man who wants to make his drawing-room beautiful or to ornament a lady's scarf. The training necessary for these lies nearer the heart and home, and does not ask for accurate copies from nature.

To make an accurate copy of a daisy is one thing, to draw it in decorative relation to other daisies or other objects is quite another, and demands less a knowledge of the flower itself than an instinctive and trained sense of the sort of company it ought to keep in the fairyland of imaginative art.

The training necessary for the designer is one which can be had by all who wish for it, in the same way that an "eye for colour" or any other sort of eye can be developed by anyone who conscientiously attends to the subject. The would-be designer must learn to know the meaning of the word "tradition" in art, and when he understands why a conventionalised tree or horse fulfils a high purpose in the field of ornament, he is already an advanced student in his art, and is in the position to express his own pleasure in trees and horses by honest attempts to render his impression of these as ornaments in whatever handicraft he happens to be working. If the truth of this be once grasped the craftsman will no longer care to work from ancient models.

Irishmen have a splendid tradition in the old art of their country, and if by studying it no new development on modern lines be possible, yet the student will surely imbibe some of the delight in the symmetrical filling of space, some of the joy in grotesque form and interwoven pattern which are the enduring virtues of Celtic art.

## GENERAL.

**The National Trust** announce that the beautiful woodland and meadows by the side of Derwentwater are to be publicly declared open for the enjoyment of future generations of residents and tourists at the English lakes on October 15. On that day Princess Louise, who is vice-president of the National Trust, will go over from Lowther Castle to perform the ceremony. It is the first time that the shores of any British lake have been thus dedicated to the public.

**The Tunnel of the Niagara Falls Power Company** was lately inspected after five years' use. No brick was out of place, and the work seemed as sound as when first laid. The brickwork was laid in Portland cement mortar.

**Emerich Steindl**, the architect of the new Parliamentary building for Hungary, died in Buda Pesth on Sunday last in his sixty-third year. Although completed the building has not yet been opened.

**Designs are being invited** from British sculptors for a monument to cost from 5,000*l.* to 6,000*l.* in position at Dominion Square, Montreal, as a memorial of Canadian soldiers who fell

in South Africa, and to commemorate Lord Strathcona's generosity and patriotism. The Strathcona and South Africa Memorial Fund offer premiums of 50*l.* and 25*l.* for the two first designs.

**The Northampton Street Improvement Committee** propose to expend 24,100*l.* on widening the lower part of Sheep Street. The Local Government Board have sanctioned 11,600*l.* for the widening of the West Bridge.

**The Birmingham Municipal School of Art** will commence the new session on the 15th inst. In the architectural section Mr. W. H. Bidlake, M.A., will lecture on architectural history, and Mr. C. H. Bateman and Mr. H. T. Buckland on architectural design. Mr. A. Watson, a gold medallist, will teach modelling and modelling design. The water-colour classes will be taught by Mr. J. V. Jelley, and instruction in heraldic drawing will be given by Mr. Treglown.

**A Statue** of the late Sir Man Singh of Ajodhya, the founder of the British Indian Association, was unveiled in the Kaiserbagh Baradari on August 13 by Sir James La Touche Lieutenant-Governor of the United Provinces. The statue which is of white marble, was carved by Messrs. Farmer & Brindley at a cost of 2,000*l.*

**The British Vice-Consul** at Philippeville, in Algeria says:—"The quarries at Chemtoll produce the most beautiful onyx marbles in the world. The interior of the new town hall at Constantine is decorated with them; the grand staircase and *salle des fêtes* are lavishly adorned with the most delicately veined and coloured onyx. It is a great pity that these marbles are not better known. A new quarry has been discovered near Ain M'lila, from which I have seen specimens of pure white rose and yellow onyx quite uniform in tinting."

**Portions of the Wall** of Roman London have been laid bare in the demolition of Christ's Hospital, Newgate Street.

**The Statue of Balzac**, which is to be erected in the Avenue Friedland, near which he lived in the last years of his life, is at last completed. The author is represented as seated. It was one of the works of the late J. A. J. Falguière.

**The Norman Work** at St. Mary's Church, Chatham, can not be wholly preserved in the rebuilding of the nave owing to the decayed condition of the masonry. The centre arch has been taken down, but its columns are to be reconstructed of the old Norman material. The two Norman side arches will remain intact.

**The Acting Lord Chamberlain** has again intimated to the London theatre managers that no house will be licensed unless its structure has received the approbation of the London County Council.

**A Test** of acetylene gas as an illuminant, which was made at Father Point, one of the most important lighthouses on the St. Lawrence, proved successful.

**The Statues** representing the seven Edwards which adorned the entrance to the annexe to Westminster Abbey erected for the Coronation, have been removed to Windsor Castle. The annexe itself has been sold for old building materials.

**The Palestine Exploration Fund** have at Gezer discovered a cave, artificially cut, about 30 feet long, made to serve as a crematorium, with a chimney cut in the rock. The floor is thickly overlaid with calcined human bones. Above this stratum of cremated remains are unburnt remains of late interment, the bodies having been buried in the contracted position. Pottery, much of it perfect, occurs largely in both strata. The remains appear to belong to two distinct races, both pre-Israelite.

**Mr. J. T. Nettlehip**, who gained some reputation as a animal painter, died on Sunday last. His special study was wild animals, and in a large number of pictures and drawings he showed how deeply he had been impressed by the form, the movements and the colours of beasts of prey, especially lions, polar bears and leopards.

**The Dedication** of the new bells at Oldswinford parish church, Stourbridge, took place on Saturday, the 30th ult. Two new bells have been added to the peal, one of the old one has been recast; and after removal to Loughborough for retuning, &c., the bells have been rebung on new frame work. Oldswinford is one of the old churches of the diocese; mention of it going back to the thirteenth century; the oldest bells of its present peal are dated at the end of the Stuart times, and four of them have apparently been in uninterupted use since 1686 and 1687.

**The Thirteenth-century Church** at Eastry, Kent, has for several years been under restoration, and an effort is now being made to raise funds to complete the work. The present church is the third which is known to have been erected on the site, the original building having been, according to some authorities, a temple of Eastre (or Eostre), the goddess of Spring.

## Architect and Contract Reporter.

## EDITORIAL NOTICES.

*In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.*

*The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.*

*The authors of signed articles and papers read in public must necessarily be held responsible for their contents.*

*No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.*

*Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.*

## TENDERS, ETC.

*\*\* As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

## COMPETITIONS OPEN.

**BERMONDSEY.**—Sept. 16.—Designs are invited for artisans' dwellings to be erected on land at Rotherhithe, within the borough of Bermondsey, and known as the Fulford Street area. Premiums of 100l., 60l. and 40l. will be awarded. Mr. Fredk. Ryall, town clerk, Town Hall, Spa Road, S.E.

**BIDEFORD.**—Sept. 25.—The Town Council of Bideford are about to erect municipal offices and a public library upon a site opposite the west end of the Long Bridge, Bideford, and they invite designs for the proposed buildings. Premiums of 30l., 15l. and 10l. respectively are offered for the designs which shall be placed by the Council first, second and third in order of merit. Designs and descriptions, &c., are to be delivered to Mr. Wm. B. Seldon, town clerk, 18 The Quay, Bideford.

**INDIA.**—Nov. 1.—Competitive designs are invited for the erection of a memorial to Her Majesty the late Queen Victoria at Allahabad. A premium of 2,000 rupees will be awarded to the design selected by the committee. Mr. H. Nelson Wright, Indian Civil Service, honorary secretary, Queen Victoria Memorial Fund Committee, Allahabad, India.

**LIVERPOOL.**—Sept. 15.—Designs are invited for new labourers' dwellings to accommodate about 2,500 persons, to be erected on the Hornby Street area. Premiums of 250l., 150l. and 100l. respectively are offered for the first three selected designs. Particulars will be supplied by the Town Clerk.

**MAIDENHEAD.**—Oct. 1.—Designs for free library. Premiums offered of £50, £20 and £10 respectively. Mr. John Kirk, town clerk, Guildhall, Maidenhead.

**NEWARK.**—Oct. 14.—Designs and suggestions are invited for alterations and additions at the infirmary, Bowbridge Road, Newark, comprising a board and committee-room, a new mortuary and provision for twenty extra beds. A prize of twenty guineas is offered for the best plans sent to the office of Mr. M. H. Colton, clerk, 27 Lombard Street, Newark.

**SOUTHEND.**—Sept. 7.—Designs are invited for a church to accommodate 500 persons, a clergy-house, and a parochial hall or parish-room about 50 feet by 30 feet. Mr. C. H. J. Talmage, Kathleen Villa, Southchurch Road, Southend-on-Sea.

## CONTRACTS OPEN.

**ACTON.**—Oct. 7.—For erection of a refuse destructor. Mr. D. J. Ebbetts, surveyor, 242 High Street, Acton, W.

**BEETHAM.**—Sept. 8.—For erection of village schools, Beetham, Westmorland. Mr. John F. Curwen, architect, 26 Highgate, Kendal.

**BEVERLEY.**—For the erection of Wesleyan Sunday schools at Beverley, Yorks. Messrs. W. J. Morley & Son, architects, 269 Swan Arcade, Bradford.

**BRISTOL.**—Sept. 10.—For erection at Stapleton of an infirmary for the accommodation of about 875 sick patients. Mr. J. J. Simpson, clerk, St. Peter's Hospital, Bristol.

**CHESTERFIELD.**—Sept. 10.—For erection of an isolation hospital to accommodate thirty patients at Penmore, in the parish of Hasland, Chesterfield. Mr. G. E. Bolshaw, architect, 189 Lord Street, Southport.

**CLOUGHFOLD.**—For alterations and extensions at the brewery, Cloughfold, Lancs. Mr. John Wilson, architect, Bacup.

**COLWYN BAY.**—For erection of first-class business premises. Particulars on application to Brown & Son, solicitors, Bank Chambers, Grimsby.

**COWFOLD.**—Sept. 16.—For alterations and additions to East Ridge, Cowfold, Sussex. Mr. William Buck, architect, Horsham.

**COWLING.**—Sept. 8.—For about 80 roods of fence walling at Stott Hill farm, Cowling, Yorks. Mr. J. Whitley, Temple Buildings, Keighley.

**DERBY.**—Sept. 29.—For erection of a school on the Normanton Road. Mr. A. Macpherson, architect, Tenant Street, Derby.

**DEVONPORT.**—Sept. 18.—For erection of buildings at the gasworks. Mr. A. B. Pilling, town clerk, Devonport.

**DEWSBURY.**—For erection of four workmen's cottages. Plans and specifications may be seen at the works of the Savile Town Chemical Co., Ltd., Mill Street East, Savile Town.

**DEWSBURY.**—For erection of two scullery houses at Thornhill Lees. Mr. Frank Dixon, Thornhill Lees.

**DOVER.**—Sept. 9.—For erection of Turkish baths adjoining the town hall, Dover. Sir Wollaston Knocker, town clerk, Castle Hill House, Dover.

**ENFIELD.**—Sept. 9.—For erection of a deaf centre and additions to the junior mixed and infant departments at the Bush Hill Park school, Enfield, Middlesex. Mr. G. E. T. Laurence, architect, 22 Buckingham Street, Adelphi, W.C.

## FRED VERITY & SON (Late VERITY BROS.) CALL LANE, LEEDS.

HOLDERS OF 9 GOLD AND SILVER MEDALS.

ESTABLISHED OVER A CENTURY.

The illustration represents our Patent Epicycloidal Window-Opener, which we claim to be the best on the market. It has a very strong and silent motion, Locks the Window in any position, forcing it well home when closed. It is suitable for Windows Opening either Inwards or Outwards, is made in any size, and operated with endless cords.

We are also Manufacturers of Fanlight Openers, Skylight Openers, Espagnolette Bolts, Door Checks and Springs, Window Gearing of all kinds, Casements in Wrought-Iron or Gun-Metal, &c., &c.

**SPECIAL NOTICE.**—In specifying our goods will Architects kindly use the Name FRED VERITY & SON.

Medals Awarded at the Building Trades Exhibition, London, 1887; International Inventions Exhibition, 1885; Adelaide Jubilee International Exhibition, 1887. [4]

**WOOLWICH.**—Sept. 18.—For erection of a greenhouse at the new portion of Woolwich cemetery. Mr. Arthur B. Bryceson, town clerk, Town Hall, Woolwich.

EARLY yesterday (Thursday) morning the town hall, Batley, was destroyed by fire. It was an old building, and the Council are at present considering plans for the erection of a new town hall. How the fire originated is unknown, but the damage is covered by insurance.

At the half-yearly meeting of the Midland Centre of the National Federation of Building Trade Employers, recently held in Birmingham under the presidency of Mr. William Sapcote, a message of sympathy with His Majesty in his serious illness, and a fervent expression of hope for his speedy and complete recovery, was forwarded to Buckingham Palace. To this the following reply has just been received by the secretary from the Home Office:—"Sir,—I have had the honour to lay before the King the loyal and sympathetic message of sympathy from the Midland Centre of the National Federation of Building Trade Employers on the occasion of His Majesty's severe illness. His Majesty was pleased to receive the same very graciously.—I am, sir, your obedient servant, A. AKERS-DOUGLAS."

## BUILDING AND BUILDERS.

To commemorate the Coronation the Council at High Wycombe have just decided to erect a new town hall. The Earl of Carrington has generously given the land for it.

A MISSION church is in course of erection in Curzon Street, Hurst, Ashton-under-Lyne. It is planned to seat 300 worshippers.

PREPARATIONS are being made in Johannesburg for providing middle-class houses, the balance of the purchase price to stand over at 7 per cent. interest. Facilities are being given for bringing building material from the coast, and houses of wire-wove material are being erected.

DR. F. ST. GEORGE MIVART has been appointed by the Local Government Board to inquire into the Birmingham Corporation's application to borrow 18,868*l.* for the extension of the infectious diseases hospital at Little Bromwich. The inquiry will take place on the 19th inst. at the Council House.

A MEMORIAL-STONE of the new church at Cressbrook, in the parish of Tideswell, Derbyshire, was laid on the 23rd ult. Messrs. A. & H. Hill are the builders, and the architect is Mr. W. R. Bryden, of 1 George Street, Buxton. The cost of the new building will be about 1,000*l.*

THE Llangollen Town Council have resolved to adopt a scheme entailing an expenditure of nearly 3,000*l.* for completely strengthening and securing Llangollen town hall, which has been pronounced unsafe and likely to collapse through the front wall being considerably out of the perpendicular.

THE newly-appointed Market Street improvement committee of the Manchester City Council met on the 28th ult. at the town hall, when Sir John J. Harwood was appointed chairman and Mr. J. J. Lambert deputy-chairman. The city surveyor and the city architect were instructed to prepare

plans for the information of the committee showing how the area might be best laid out, and it is understood the matter will be discussed at a subsequent meeting.

PLANS having been invited for the erection of halls to be used for Sabbath school and other Church work in connection with Larkhall parish church, those submitted by Mr. Eric Sutherland, 96 Renfield Street, Glasgow, have been selected, and he has been instructed to prepare working drawings and to have building operations commenced. The design embodies some novel architectural features, and the halls will be fitted up and equipped in the most perfect manner for the work for which they are intended.

A SERIOUS accident occurred on Monday at Tunbridge Wells, resulting in the death of one man and injuries to four others. The men were at work in connection with the erection of the new opera house on Mount Pleasant, when the scaffolding on which they were standing suddenly gave way, and they fell a considerable distance to the ground. A stonemason, named Murrell, was killed on the spot, and the four others were so badly injured as to necessitate their removal to the hospital, where two of them lie in a precarious condition.

ON Monday afternoon Sir Charles Dalrymple, Bart., M.P., Newhailes, opened the new school at Crookston, N.B., erected by the Inveresk School Board. Situated on the main road between Dalkeith and Tranent, a little over a mile south of Musselburgh, the building is a handsome structure of brick, one storey in height, standing in the centre of extensive playground accommodation. It contains a large central muster hall, off which branch six classrooms, capable of accommodating sixty pupils each. There are, besides, the usual teachers' rooms, &c., and the building is heated throughout by hot-water pipes.

THE ceremony of laying the foundation-stone of the church of St. George for the new and increasing village of Badshot Lea took place on the 23rd ult. The site of the new church adjoins the main road, and is opposite the Board schools, and quite in the centre of the locality. Built in the Gothic style, of local stone, with Bath stone dressings and tiled roof, the edifice will be a pleasing building when completed. At present the erection of only the nave and a side aisle, to accommodate 250 persons, is being proceeded with, in accordance with the plans of the architect, Mr. C. H. Mileham, of London. The cost is upwards of 3,000*l.*

THE Charity Commissioners have approved the plans for six almshouses to be erected in two blocks on the land now

Telephone No 773 King's Cross. Telegraphic Address, "Veneer, London."

occupied by the present buildings at Walton, and the contract for the first three has been secured by Messrs. Willis & Pickenson, of Weybridge, who will start work on Monday. Whereas the existing almshouses consist of only one room each, the new cottages will contain a living-room and a bedroom with the necessary offices, all, however, on the ground floor. There will still remain of the acre of land which the estate consists sufficient ground for the erection of the proposed cottage hospital should the Commissioners give their consent, or which they have been asked, to a portion of the land being let on lease by the trustees for that purpose. With regard to the present almshouses, of which there are ten in a single block, these will not be interfered with until death removes their occupants, who will continue to be made as comfortable as possible. Two houses, however, are already empty, the nine inmates living in the remaining eight. Under the terms of an order made by the Charity Commissioners in 1896 the trustees are compelled immediately to reduce the number of almspeople to six. But nothing will be done until there remain only five of the present nine inmates. Then a vacancy will be declared, and the new occupant will reside in one of the cottages now being built. When another inmate dies his or her successor will also be given a new cottage, and so on until all six are filled. But so long as they live the present inmates will not be disturbed from the possession of their existing domiciles, and until the new cottages are required for almspeople they will be let by the trustees to ordinary tenants, the rents going to swell the funds of the charity. When all the present houses are vacated the block will be pulled down.

THE memorial-stone of the church of St. Agnes, the latteridge, King's Norton, was laid on Saturday, the ceremony being performed by the Viscountess Cobham. The designs for the church provide for a massive tower at the west end, but the upper portion of this, however, is not included in the builder's contract of 8,600*l.*, and it is hoped that the necessary additional sum of 450*l.* will speedily be forthcoming. In style the structure will be a free modern adaptation of the order of architecture prevailing at the end of the fourteenth century, and the materials used will be red Leicester bricks for external and internal facings, with external details in Doulton's grey buff terra-cotta, and internal details in Quarella stone of a soft green colour. The roofs will be covered with green slates. The plan shows a chancel with flatly-canted apsidal end, out of which the organ chamber opens on the north side; a nave of five wide bays;

north and south aisles and transepts, the latter with a seating capacity of eighty-one being used as a morning chapel. It is intended that the tower at the west end shall have a belfry for six bells, the lower storey forming a large porch. There will also be other porches at the west end of the north aisle and to the morning chapel. A corridor flanking the south side of the chancel will give direct access to the mission-room at the back of the church, in which are situated clergy and choir vestries, and this passage, by means of a small archway from the chancel, will also serve as a return way for communicants. The church will be very amply lighted, the nave having a clerestory with two windows of two lights in each bay, and there are to be coupled windows of one light in each bay of the aisles. The chancel will have a five-light window in the centre and smaller ones on either side. The principal feature of the large west-end gable will be a very fine window of nine lights in elaborate tracery. The church will have a seating capacity for 700, exclusive of clergy and choir. The heating will be by means of a very thorough system of low-pressure hot-water pipes and radiators. Messrs. Cossins, Peacock & Bewlay are the architects.

### ELECTRIC NOTES.

THE Bolton electricity committee have requested Mr. G. Temperley, architect, to prepare plans for an extension of the engine and boiler-houses at the electricity works. Messrs. S. Talbot & Co.'s tender was accepted for boiler seatings and economiser chamber at the works, that of Messrs. J. & E. Wood for supply of iron brackets for cable trench, and that of Messrs. Nalder Bros. & Thompson for an ammeter.

A SPECIAL meeting of the Holyhead Urban Council was held on the 26th ult. to receive an estimate of the probable cost of the electric-lighting scheme for the town. Mr. Pryce White, the engineer, estimated the cost at 16,000*l.*, with 750*l.* for emergencies. It was resolved to purchase the existing steam mills at a cost of 3,000*l.*, subject to the approval of the Local Government Board, as a site for carrying out the scheme of lighting the town with electricity.

APPLICATION is to be made to the Local Government Board by the Wallasey gas and electricity committee for power to borrow the sum of 52,350*l.* for providing for the requirements of electricity works up to the year 1910. This includes 1,140*l.* for 5,200 square yards of land in Seaview Road,

THE streets of Airdrie were on Monday evening lit with electricity for the first time. In presence of a large gathering at the distributing station in Craig Street the ceremony was performed of turning on the new light. Bailie Ewart, convener of the lighting committee, presided, and stated that four years ago the Council got a provisional order empowering them to light the streets with electricity. Eighteen months ago the Scottish House Electricity Company, who have works in Coatbridge, took over the order, but did not begin till a few months ago to lay down the cables. Since then they had left no stone unturned to have the light switched at this the beginning of the lighting season. The electricity is generated at the company's works in Coatbridge, which burgh is also partially lit by them. In Airdrie, where there will also be a number of gas lamps retained, the electric installation consists, for the present, of ten arc and over a hundred 16 candle-power incandescent glow lamps.

### TRADE NOTES.

SYNOD HALL, Londonderry, is being warmed and ventilated by Messrs. John King, Ltd., engineers, Liverpool, who are employing their latest improved system of combined warming and ventilation.

To commemorate the Coronation of H.M. King Edward VII. a new large-size turret-clock showing the time upon one large external dial, painted and gilt and fixed at the top of the tower, was set going at Leven parish church, Skirlaugh, Hull, on Saturday last, the chairman and chief promoter of above being Mr. Wm. Bethell, of Rise Hall, near Hull, a nephew of Lord Grimthorpe, from whose design the clock was made and fixed by Wm. Potts & Sons, clock manufacturers, of Guildford Street, Leeds, who on the same day fixed a large clock at the new Council offices, Annfield Plain, co. Durham, to commemorate the long and useful reign of H.M. the late Queen Victoria.

### VARIETIES.

A NEW cottage hospital was opened at St. Andrews, N.B., on the 27th ult.

ON Sunday the New Jerusalem Church, Moorside Road, Swinton, was reopened, after extensive alterations.

THE newly rebuilt St. James's schools, Brighouse, which were destroyed by fire a few months ago, were opened on Saturday afternoon. The new buildings provide accommodation for two departments, mixed and infants. They have cost 1,400*l.*

THE new Grove school, Hanley, Staffs, which is to provide accommodation for a portion of the Northwood district, was opened on the 25th ult. The new building has cost nearly 10,000*l.*, and will afford accommodation for 670 boys and girls, so that with the older portion room is provided for 1,000. The building has been erected by Messrs. Tompkinson & Bettelley, of Longton, under the superintendence of the architect of the board, Mr. E. E. Scrivener, of the firm of Scrivener & Sons, Hanley.

AN interesting discovery of prehistoric remains has been made at the fishing village of Ambleteuse, near Calais, by Professor Dharvent, of the Anthropological Society of Paris. In connection with works of sea defence the removal of sand on the dunes at Ambleteuse was being carried out to a depth of 20 feet, and this revealed the presence of an ancient soil with many evidences of prehistoric man. Further excavation under Professor Dharvent proves this to be one of the most important neolithic stations yet discovered. It is more than 150 yards square, and includes what was undoubtedly a large workshop for the making of flint swords, knives, arrow and javelin heads, &c., numbers of which were found. Professor Dharvent says the discoveries show this was the home of a prehistoric people who knew the use of fire, lived in huts on fishing and the chase, and made their weapons from the silex at hand on the shore.

AT Sittingbourne on the 28th ult. considerable interest was taken in the opening of a new Roman Catholic church. The Church of the Sacred Heart, as it is called, is a Gothic building with a very imposing façade. It is adjacent to the main road and is situated at the west end of the town. The building is constructed of specially selected bricks, and Bath stone has been freely used in the fabric. The woodwork is of oak, and the Early English type of architecture has been rigidly adhered

# WAPICTI

throughout. A niche over the handsome main entrance to the church contains a statue of the Redeemer with His Cross. On either side are statues of St. Augustine and Thomas à Becket, and over the arch between the church and the presbytery is a fine statue of St. Michael vanquishing the dragon. The altar is beautifully carved in Sicilian marble. The present front of the building, which was designed by Mr. W. Leonard Skes, of Sittingbourne, is 4,300*l*.

BEVERLEY, which has long felt the need of a good secondary school, has at length had its longings realised, and the new grammar school in Queen's Gate will be found a proper provision for the future in the shape of up-to-date laboratories, science lecture-room and workshop, and a large capable staff of masters. The new buildings of this ancient foundation, which were opened on Friday last, have been erected on the west side of Queen's Gate on a site which stretches westward towards Westwood. The principal entrance to the grammar school leads to a central corridor, on either side of which are three classrooms 121½ feet by 20 feet, which will each accommodate twenty-four boys with single desks. Two of the classrooms are divided by movable partitions, so that they can be converted into one large room. Near the entrance is the masters' room and on the other side of the corridor is a large cloak-room and lavatory, near the former being an entrance from the playground. At the north end of the building are rooms to be devoted to science teaching, with a laboratory 30 feet by 22 feet, and lecture-room. The south end of the building is planned so that the central hall and further classrooms can be added when extensions are required. The rooms are well lighted from the left side and the heating and ventilation are supplied on the latest principles. The exterior is simply treated in red brick with stone dressing, and the roofs covered with red tiles. Over the entrance is a carved

panel bearing the arms attributed to the Minster, with which the grammar school was connected for seven centuries, and the arms of Beverley, with the motto of the school, "Haec studia adolescentiam alunt, senectutem oblectant." The work has been carried out under the supervision of the architect, Mr. J. Bilson, F.S.A., of Hull.

THE IRON AND STEEL INSTITUTE.

A MEETING of the Iron and Steel Institute was opened in Düsseldorf on Wednesday. Governor von Hollenfer welcomed the delegates in the name of the Government. He said:—As twenty-two years ago, so now, an industrial exhibition in Rhenish Westphalia has caused the Iron and Steel Institute to hold its meeting in Düsseldorf. We are extremely pleased and honoured thereby, as the Institute is without question in the front rank and before all other associations whose object it is to promote scientific knowledge and discovery. Born in England, the Iron and Steel Institute gradually acquired international importance. Now men celebrated in science and in its application join hands to place their knowledge at the service of the Institute, whose progress is of the greatest importance to all civilised peoples. I consider that the development of the steel and iron industry forms an index of a nation's economic culture. We therefore hope that the industries of all countries may derive benefit from these discussions. With the wish that your visit to Düsseldorf may be a pleasant one, and that you may retain an agreeable remembrance of your reception, I bid you once more, in the name of the Government, a hearty welcome.

Herr Feistel, the second burgomaster of Düsseldorf, then greeted the delegates, saying:—

I had the honour of greeting the Iron and Steel Institute at Düsseldorf twenty-two years ago. I am highly honoured that the office falls upon me again. At that date Düsseldorf had 90,000 inhabitants, and was suffering from the depression following on the war of 1870. Now it counts 230,000, and boasts of a highly developed iron industry. In 1880, despite its position hard by the Rhine, Düsseldorf had no proper economic connection with that proud stream. Although much has changed, one thing has not, and that is that you are the same welcome guests now as then. We hope you may feel yourselves particularly at home among us, as we have in our midst experts with whom you can

exchange opinions on all subjects dealing with the iron and steel industry. But the visit of foreign associations, consisting of owners and of managers of great works, men of experience and knowledge, possesses a significance exceeding the limits of a purely expert nature. These international meetings offer an opportunity for free discussion on all subjects of conversation; the power of the spoken word takes the place of the written one, so often misunderstood. Such conversations call forth intellectual currents which transcend political confines, and with the proverb "Knowledge is power" give an ever-increasing practical importance to them, thus bringing peoples closer together and rendering unpleasant meetings between them ever rarer. As the political representative of Düsseldorf I bid you all welcome, and hope that this meeting of the Iron and Steel Institute may give the best results in all directions.

The president of the Association of German Iron Men, Privy Councillor Lüg, followed:—

I welcome you all most cordially in the name of the German iron and steel industry. As President of the Rhenish-Westphalian Exhibition of Industry, Trade and Art I rejoice to see you in such numbers. You will find in the exhibition the results of our industry, which are open to your criticisms, and I hope you will freely criticise what you see. These criticisms will be all the more welcome to us as they emanate from a quarter which, as regards the manufacture of iron and steel, we recognise as in many respects our masters. In 1880 you criticised our exhibits favourably. I hope you will find things which will interest and instruct you, and that you may take away a very pleasant recollection of your visit.

Mr. Whitwell, the president of the Iron and Steel Institute, responding, said:—I rise with extreme pleasure to respond to the kind and hearty welcome which has been accorded us here to-day. I am sure our friends in Düsseldorf have no idea of the sympathy created in England by the invitation to visit Düsseldorf. It does not seem long since we last met here, but how much has occurred in the space of time. It has given me much pleasure to hear a member of the Government welcoming us in so cordial a manner. It is with exceeding pleasure that I see you assembled here together. These meetings bring young members together. We have come here to learn and to see a great deal which is not only of interest, but which will instruct us wonderfully. It is many years since I came here. We have visited many countries together and striven to enlighten young members. At this exhibition everything will be explained. I feel extreme

gratification in the thought that the young members will return enlightened and with the stimulus for fresh endeavour. We are keenly alive to the importance of education and to the greatness of Germany, with whom we have the greatest sympathy. It will be our own fault if we do not take advantage of the splendid opportunity here offered us and learn as much as possible, so that we may tell our friends on our return how much we have enjoyed and benefited by our visit.

The President also announced that Mr. Andrew Carnegie had been elected president for next year and had accepted the office.

### GLASGOW ARCHÆOLOGICAL SOCIETY.

The members of this Society visited Dumfries on Tuesday and drove to Lin-Cluden Abbey and afterwards to New Abbey. At the former place Mr. Whitelaw, architect, read a paper on the history and architecture of the abbey and Mr. Barbour, Dumfries, supplemented the information which it conveyed. The remains of the abbey church, consisting chiefly of the choir, excited the admiration of the visitors from the richness of its architectural detail, and Mr. Dalrymple, of Meiklewood, the hon. secretary, characterised it as one of the most interesting buildings he had ever seen. The configuration of the adjoining ground at the confluence of the Nith and the Cluden excited speculation as to whether the conical mound is the ancient moat and the square embanked lawn its base court, and that the builders of the abbey had availed themselves of those features in laying-out its garden or pleasure grounds. At New Abbey the Rev. Dr. Wilson gave a very interesting account of the venerable building associated with the name of the Lady Devorgilla. Luncheon was served in the Station hotel at Dumfries. Mr. George Neilson, vice-president of the Society, presided, and Provost Glover, one of the guests, proposed the toast of success to the Society.

### FIREPROOF MATERIAL.

H.M.S. *Good Hope*, one of the new great armoured cruisers fitted with non-flammable wood, is to be completed this month and further experience of this material, which has been the subject of so much controversy, will be watched with some interest. The flame-resisting qualities of non-flammable wood are universally admitted, but complaints, it will be remembered were made in the case of H.M. new yacht *Victoria and Albert*.

its effect upon paint. It is only fair to mention that the company's contention as to the wood supplied to the yacht has been exposed to rain at Pembroke and fitted on board in damp state, contrary to their instructions in regard to it, confirmed by later results, for after the paint had been scraped off, the wood thoroughly dried, and afterwards repainted in the ordinary way, it was found to be perfectly satisfactory. When it is remembered that there is over 600 tons of this vessel the importance of this will be realised. An interesting experiment has just been concluded after eighteen months' test in regard to the alleged complaint of the effect of flammable wood upon the bullion and officers' clothing stored in chests made of this material. To settle the matter the Admiral Superintendent at Portsmouth Dockyard had two chests of drawers made, one of ordinary timber and the other of non-flammable wood. Clothing, with the gold lace, was placed in each of these chests, which were put in the Admiral Superintendent's office, and the drawers sealed. After an interval of eighteen months the drawers have now been opened, with the result that the clothing and lace in the treated wood chest have been found in the same satisfactory condition as in the ordinary wood drawers. The test is to be continued in a vessel at sea, but in the meanwhile it may be of interest to mention that the officers of the United States cruiser *Illinois*—lately at Portsmouth for the Coronation Review—state that they have no complaint whatever to make of the non-flammable wood on board their vessel.

Properly worked and managed, there is no doubt whatever that non-flammable wood will become very largely used by architects and the building trades generally, as it is quite apparent that more attention in future must be given to the use of reproof materials, owing to the increase in the outbreak of fires, and the severity of the fires to which we have recently had to give attention.

#### R. WAYGOOD & CO., LTD., AND THE OTIS ELEVATOR COMPANY, LTD.

CONSOLIDATION of the above companies has been effected, and the joint business will in future be carried on under the name of "Waygood & Otis, Ltd."

The name of Waygood has been prominently associated with hydraulic lift and hoistwork for the last half century, while the Otis Company claims the credit of having introduced and

popularised the electric lift in Great Britain. It is no exaggeration to say that a very large portion of the lift business in this country has been carried out by these two firms, and that the more responsible and exacting class of work, such as installations in the Royal palaces, Government offices, public institutions and leading hotels has been largely entrusted to one or other of them.

The following may be mentioned as a few of the lift installations recently carried out by one or other of these companies:—

Buckingham Palace; Bank of England; the Colonial and India Offices; the Royal Stands, Ascot; the Speaker's residence, House of Commons; the Institution of Mechanical Engineers; the Surveyors' Institute; Central London Railway; Salisbury House.

With reference to crane and hoistwork installations have been carried out for the following:—

Bellamy's wharf, Fresh wharf, Gun and Shot wharf, Hay's wharf, Kennett's wharf, Mark Brown's wharf, Lancashire and Yorkshire Railway, London, Brighton and South Coast Railway, London and North-Western Railway, London and South-Western Railway, South-Eastern and Chatham Railway, &c., &c.

The consideration which, we are informed, determined the directors and shareholders of both companies in favour of fusion of the two businesses is that each party is able to supplement the other in important respects, the Waygood Company possessing excellent manufacturing facilities, while the Otis Company controls for the British Empire and Europe the patents, designs, and wide experience of the Otis Elevator Company of the United States of America. The British and American Otis Companies are quite distinct organisations, possessing only the name in common; but the British company is not only the proprietor of the American company's patents in its territories, but has the immense resources of the latter at its back.

The new company, Waygood & Otis, Ltd., will thus become possessed of the patents, designs and experience of the Otis Company, U.S.A., in addition to the manufacturing facilities of R. Waygood & Co., and be enabled to undertake the construction and installation of lifts, cranes and hoisting machinery on lines of approved standardised designs, insuring uniform quality; while the increased facilities for production following upon the joint requirements of the two businesses and future developments must lead to reduced cost of manufacture and of selling price to the public.

There is rightly in this country a disposition to look with suspicion upon consolidations of businesses. But it is proper to discriminate between "combines" brought about for the purpose either of bolstering up decaying businesses or of "cornering" a trade or public necessity, and consolidations effected with the object of cheapening manufacture and assuring high and uniform quality of product. In the case of the Otis and Waygood Companies the fusion is that of two successful concerns returning steady dividends to their shareholders, and has for its object the creation of an organisation capable of effectively dealing with the increasing demands of, and the heavier engineering problems before, the lift industry.

Waygood & Otis, Ltd., will continue the manufacture of lifts and hoisting machinery in London, as heretofore carried on by Waygood & Co. at their works in Southwark; but it is claimed that the new company will have the additional benefit of the American Company's design and workshop experience to assist it in maintaining its factory and products at the highest level as to quality and cost of production.

Mr. H. C. Walker, chairman and managing director of R. Waygood & Co., will be chairman, and together with Mr. R. Percy Sellon, M.I.E.E., managing director of the Otis Elevator Company, Ltd., will act as joint managing director of Waygood & Otis, Ltd.

### EXPERIMENTS WITH FIREPROOFED WOOD.

A SERIES of tests of wood treated with various fireproofing processes was carried out recently at the Massachusetts Institute of Technology under the direction of the new Insurance Engineering Experiment Station. According to the *New York Times*, in general a temperature of thirty-five hundred degrees Fahrenheit seems to have reduced both treated and untreated wood to charcoal rapidly and easily, both of them blazing while exposed to the heat, although the treated wood ceased to blaze in a few seconds after being removed from the furnace, while untreated wood continued to flame for several minutes. In another experiment, intended to test the comparative resistance of the two kinds of wood to this temperature, it was found that it took about a minute longer to reduce the treated wood to charcoal than the untreated wood. At lower temperatures the fireproofing treatment appeared to be more effective. At eighteen hundred

degrees Fahrenheit both the treated and untreated wood blazed and were reduced to charcoal; but when simply dropped on a red-hot iron plate the pieces of treated wood merely charred at the point of contact, while untreated wood blazed up and was consumed. In the final experiment a block-house was built of pieces of each kind of wood and subjected to fire for five minutes. The treated wood burned where more exposed to the fire, but not readily, resisting for ten minutes before it fell, while the untreated blocks blazed up, and the structure fell in five minutes. In this test different samples fireproofed wood were used together, and it was observed that some samples resisted the fire longer than others; but the *Times* reporter says that some sticks simply painted with fireproof paint "withstood the flame fully as well as the wood treated to a fireproofing solution which soaked through the entire stick." In regard to the question whether the fireproofing imparts any objectionable quality to wood, Professor Norton, the director of the experiment station, said that he had found the treated wood much more injurious to tools than untreated wood, both because it was harder and on account of some chemical action of the fireproofing solution on the steel which caused the tools to rust very quickly.

### HYGIENE IN SCHOOLS.

At the late congress of the Institute of Public Health a paper was read by Mr. C. W. Bracker on "Practical Hygiene in Elementary Schools," in which he referred to the introduction of hygiene as a subject. He considered "that definite instruction should be given to all children in the senior departments of all elementary schools in the principles of hygiene."

In the syllabus for the 1903 examination for "acting teachers, the Board of Education have incorporated the following under the head of school method:—Ventilation, heating and temperature.

Messrs. Robert Boyle & Son, Ltd, announce that it is their intention to present to the schools in this country and the colonies a large educational diagram illustrating natural ventilation, the benefits to be derived from its employment, how it may be successfully achieved by any one, and a fresh, pure air secured in our private and public buildings by the simplest means by an intelligent comprehension

laws which govern the movement of air and by the action of the powerful natural forces which are ever ready to hand and unceasingly in action. The method shown on the diagram is given as an example of the general arrangement of natural ventilation as applied to buildings, and as evidence of its success, as the people, both the old and the young, must win object lesson of tried utility, the advantages of which have been proved beyond a doubt, to fix their attention and conviction to their minds. The people are not theorists, theories alone appeal to, or make any appreciable impression upon them. The diagrams are issued at the present commemoration of the Coronation of the King, and also the jubilee of the scientific application of natural ventilation a complete system, developed fifty years ago by the late Robert Boyle, sen., in conjunction with Professor Michael Faraday—with whom he was a co-worker—and has since been brought to a high state of perfection as the result of a fuller knowledge of the natural laws which govern ventilation.

## SURVEYING IN CENTRAL AMERICA.

of the engineers most actively engaged on the survey in Central America to furnish information concerning the practicability of various ship-canal routes since 1888. N. Boyd Ehle, who has a paper on the problems and methods of the Isthmian canal surveys in the "Transactions of the Association of Civil Engineers of Cornell University." The organisation of the engineering department had a chief engineer at the head, under whom were senior and assistant engineers. The latter were in charge of the work in fieldwork or a section of construction. A survey party had two instrument-men, a level rod-man, two chain-men, a helper and about eight machete-men as a minimum. In the new country the assistant engineer was supposed to scout the way ahead of the instrumental survey, using hand instrument and perhaps pacing distances. To get the best results a theodolite was used and a chart giving the pacing reduction for various slopes. With a small protractor it was possible to make a map and sketch in the topography. A machete was, of course, the most essential part of the outfit, without which progress was well nigh impossible. Such valuable information could be easily and quickly obtained by these preliminary examinations, and if results

justified a detail survey, a compass or transit lines with levels would be run through paths cut by the machete-men and the line cross-sectioned for a considerable distance on each side, so that in case of a probable canal location this could be projected on the map. Usually the fieldwork was mapped out on a scale of 400 feet to an inch and 10 feet contours, but in the more important work at the lock and dam sites, 100 feet or 50 feet to an inch was used. The topography of large tracts was thus developed in order to cover thoroughly the area of comparative feasibility. No comprehensive idea of the whole problem could be secured except from maps, for the fieldwork was somewhat like surveying in the dark, as far as the physical characteristics adjacent to the line were concerned.

There was, however, a great difference in the amount and character of the work of the various assistant engineers, due, Mr. Ehle says, both to method and energy displayed. A certain man seeking out a ridge or canal location would try to make a checker-board survey of the whole country in question and pick out his results on a map, while another would carefully scout out the work on the ground and direct the survey at once to the desired results. The latter was the more valuable man, but it required greater physical energy on his part. Often an assistant engineer simply kept his men at work while he remained in camp, ran the party, and submitted the results.

In the surveys of the impounding ridges for the basins it was considered best to determine the general direction and follow that compass course until it ran off the heights into a watercourse, and then offset back up a branch to the divide again and start over.

In a canal survey it is important to get the shortest distance with the least elevations, and this usually led into valleys and swamps where the work was disagreeable, difficult and unhealthy, not to mention the attention of the myriads of mosquitoes and other insect pests. Transit location surveys never averaged one-half mile a day, while compass and cross-section work usually averaged less than 5,000 feet per day, with a maximum of about 8,000 feet per day.

In a river survey, stadia methods were used for fixing the points along the bank, and the soundings located from these by the stadia or sextant. With the sextant the boat was usually run on a range and the soundings taken at time intervals. The line was assumed straight between the sextant observations, which is only possible in still water. With the stadia it is possible to locate each point more quickly and accurately.

Stadia or gradient methods were of little use in the forests, and the chain was usually depended on for distances. Triangulation surveys were used on Lake Nicaragua, but were not effective on the San Juan or other rivers on account of the great difficulty of clearing out the overhanging trees along the banks.

In a reconnaissance along the coast of Darien two sextants were used to establish the position and elevation of points on the distant mountain range and the contour sketched. The distance between the observers was determined by observation on the mast of a ship. The results, although somewhat crude, answered the purpose, and were secured very quickly and cheaply.

In the investigation for foundations and classifications of material various methods were used. The earth auger was the most simple and least satisfactory, as it was difficult to manage at any great depths, and when stone was reached it was the limit of the boring and in no wise conclusive that this indicated rock in place.

The Pierce machine, with its facilities for driving, casing and washing up light materials, succeeded the common earth auger. With this when stone was reached it was customary to lower sticks of dynamite and explode them by an electric battery, which usually was sufficient to displace ordinary boulders. If this was not effective the diamond drill was used to get deeper and obtain a core of the material. On the Panama Canal deep test pits were used, and even a tunnel to determine the substrata.

The various classifications of material were obtained from samples preserved by the boring foreman in small bottles of earth, or of rock by taking a section of the core. These were labelled with the location of the hole and depth in feet at which they were taken, and shipped to headquarters for use in classifying the material on the cross sections for estimates or determining questions of foundations.

Gauging stations were established at important points on the various canal routes and around the watershed of the water supply for the summit level. The observers were required to keep a careful record of the rain gauge, river gauge and thermometer, also to make gaugings of streams with the current meters. Sediment observations were also conducted on the more important streams by lowering a sediment box and ascertaining the quantity of material moved in a certain period. Current meters were rated by moving them at uniform velocity in still water and plotting the results as a curve. The metre

was then used with a boat that was anchored at points along the cross-section of a stream, if this was possible. It was sometimes necessary in large rivers in flood to rig a cable across the stream. On this was hung a car from which the observer used his metre. The results of the rain gauge observations were plotted to give zones of rainfall, which were variously coloured. These data and the river gauging operations were necessary in the very extended computations to ascertain the sufficiency of water for the lockage, and also the proper measures to be taken to regulate the floods.

The camps were usually sheds with a roof of palm leaves which were lapped similar to shingling; side walls were not necessary. Canvas tents were not a success, as they were soon ruined by the mildew of the damp climate of the rainy season. The beds were of a piece of canvas with poles through the side loops, and raised on crotched sticks. The kitchen arrangements were very simple; crotched sticks with a cross-bar were used to hang the kettle over the fire, or sometimes a rough fireplace of large stones took the place of this.

In the rainy season it was first the custom to attempt to dry wet clothes with Sibley stoves; but after several dry houses were burnt with their contents this was not in favour; it was found that no ill effects were experienced from wet clothes, although it was not unalloyed pleasure to get out of wet blankets into cold wet clothes. In the evening, on returning from work, it was customary to take off wet clothes, have a bath and get into pyjamas. In mosquito infested camps, this was followed by getting under the mosquito bars as soon as possible after supper. It was sometimes necessary to do outdoor work under mosquito bars.

The officework in the field was usually somewhat crudely done, merely to verify the accuracy of the work and its completeness. Duplicate copies of notes were made and sent to the division or chief engineer's office. At headquarters the fieldwork of the various parties was combined into large contour maps somewhat elaborately drawn. On these large contour maps the various projects were laid out and studied. A paper location would often be sent to an assistant engineer to be run out and verified. When all the data were in, estimates were made by taking cross-section notes from the maps, plotting these with the classification of material obtained from the boring notes, and obtaining the yardage by the planimeter measurement. Maps were plotted and surveys adjusted by the method of latitudes and departures. Courses were generally referred to the true meridian in transitwork, checking thence

middle course. From star observations it was possible to find the co-ordinates for the maps. Longitude was obtained by using chronometers from Panama, which had been very accurately located by direct observation as a primary point by such astronomical expedition. By means of these map co-ordinates it was possible to make the new work on small-scale maps with those of the survey and other expeditions. For this work the large maps were pantographed down; usually each set of maps was reduced one-fourth, although this was not strictly adhered to. The Darien survey the field maps were 1/12000, the general map a route 1/60000, and the general map of all the routes 1/100000. The general map of the Panama route was made on a scale of 1/10000; the profile had a similar horizontal scale with a vertical scale of 1/506880, the sheets of general topography 1/19200, and the detail topography 1/19200; on these latter were placed the boring records. Plans of structures were made 1/480, 1/960 or 1/100, as was necessary to show

have no doubt are being injured in the same way. These bridges are of the greatest historical interest, and are picturesque in the highest degree; but most certainly if left to the tender mercies of the county councils their destruction sooner or later is inevitable, hideous iron and steel constructions taking their places.

That the preservation of beauty on the river and its banks is within the province of the Thames Conservancy seems to be implied by the enactment of their by-laws relating to birds and wild flowers; and it is devoutly to be hoped that they will in the present instance see their way to putting a check upon the hasty and ill-considered proceedings of the Oxfordshire County Council.—I am, Sir, faithfully yours,

Riverside, Wallingford.

G. D. LESLIE.

Sir,—The clear statement of your correspondent as to the facts connected with the resolution passed by the County Council of Oxford on August 9 gives a clue to the manner in which the public are so often taken by surprise when it is already too late to frustrate vandalism in the destruction of the features of lovable scenery.

The appreciation which you show in your leader of the influence of a beautiful river upon its people must be of sterling value to reflective minds. The nation, without doubt, is in serious danger of losing faith in the testimony of our poets and painters to the exceptional beauty of the land which has inspired them. The poets, from Chaucer to the last of his true British successors, with one voice enlarge on the overflowing sweetness of England, her hills and dales, her pastures with bright flowers and the loveliness of her silver streams.

The havoc wrought upon true beauty in recent times is ever committed in the name of utility; the last undoubtedly demands its proper place, but without the sanctification of art (greed and naked practical wants alone satisfied) our habitation would be left to us desolate, and then the commercial prosperity, which the utilitarians alone consider, would itself be affected.

It is the cherishing of the wholesome enjoyments of daily life that has implanted in the sons of England love of home, goodness of nature and sweet reasonableness, and has given strength to the thews and sinews of her children, enabling them to defend her land, her principles and her prosperity.

It is necessary thus to enlarge upon the substantial services of art to the nation, since these are daily ignored.

With regard to the three Sonning bridges, the reconstruction

## SONNING BRIDGES.

Following letters on the proposed renewal of the bridges have appeared in the *Times* :—

“Every lover of our beautiful river will, I feel sure, be led to you, sir, and to your correspondent for calling attention to the act of vandalism which the County Council of Oxfordshire have decided on perpetrating, in replacing the old bridges at Sonning by structures of steel and iron. The question of the preservation, or at least of the artistic reconstruction, of these and the other old bridges on the upper Thames has latterly become a very important one. For all ordinary traffic these old bridges, with occasional repairs, would be sufficient; but one after another they must certainly contribute to the enormous strain imposed upon them by the traction engines; these ponderous machines and the weight which they draw are, with very few exceptions, concentrated without springs, the result of which is that the impact falls vertically on the bridge, like the blows of a hammer, as the wheels jolt over the various irregularities of the roadway. Our old stone bridge at Wallingford is, according to expert evidence lately obtained, slowly splitting in two from this very cause; the bridges at Radcot, Abingdon, and Shillingford, with St. John's and New Bridge, I

ANDREW WILSON writes as follows:—“The Filters sold by the Berkefeld Filter Co., Limited, London, W., remove all germs from water. They therefore represent ideal filters, giving pure (i.e. germless) water, and thus prevent Typhoid and many other diseases.”

BERKEFELD FILTER CO. Ltd. 121 OXFORD STREET, LONDON, W.

tion of which is contemplated, parts of them have already been gradually rebuilt with iron fittings in recent years, and no disinterested reasonable person can see why they could not be easily made sufficient to carry all existing traffic. If the bridges were to be widened in the service of some disproportionate vehicles, it is obvious that the traffic such enlarged bridges are intended to carry would be put forward as an argument for demolishing the exquisite old bridge over the main river which is the glory of this exceptionally picturesque and well-ordered village; and this is a matter of which even the most utilitarian would soon see the evil in the diminished attraction of the river not only to Englishmen, but to Colonials and Americans who have across the sea read widely of its beauty.

Remonstrance must look ahead, and can only now be of avail in recognition of future further danger. We on our side of the river have, I believe, nothing to do with the money cost, and therefore it may be urged that we have no right to interfere; but the population on the near Oxford side is small. On the Berks side are the people immediately concerned in the beauty of the neighbourhood, and we are called upon to plead the cause for the whole of beauty-loving England, and of all river-loving people in particular.

As you point out, our right is purely a moral one, but as matters stand at present equity has been grossly violated by the fact that the plans have never yet been made public.

Before any further step is taken we claim that full plans and elevations should be submitted to public opinion, represented in Sonning by a committee now forming. Surely this is no extravagant demand. The matter calls for urgent public attention.—I am sir, yours truly,

W. HOLMAN HUNT.

Sir,—The roads and bridges committee of the Oxfordshire County Council would have neglected their duty if they had not insisted on the necessity of preparing new foundations for the bridges at Sonning before the period of floods if the risk of a serious disaster was to be avoided. They were wrong in not submitting the design of the superstructure to the inspection of the Council. If they had done so I believe the opposition of the Earl of Jersey and others, and the hesitation of members who, like myself, did not vote, would not have arisen. I saw the design after the meeting. The bridges are lattice girders, which the strength of the material (steel) permits to be light and elegant in appearance. Since the meeting I have seen several similar structures in situ in Sutherlandshire, and

I feel certain that those who are properly jealous that no structure shall be permitted which will be detrimental to the beauty of the Thames Valley may dismiss their fears.

The Council defer to the authority of their chairman, Mr. Valentia, and are always sorry when his political duties deprive them of his presence, but he will be the first to say that, with his political duties compel him to be absent, he could not be replaced by a more competent substitute than Mr. Cobb. Your obedient servant,

A MEMBER OF THE OXFORDSHIRE COUNTY COUNCIL

### THE HOUSING PROBLEM.

THE committee appointed by the two Houses of Parliament in March last to consider the standing orders relating to houses occupied by persons of the labouring classes have rendered their report. With regard to the Metropolis, they recommend that every case in which houses of the labouring classes are proposed to be taken shall be notified to the central authority, while outside London it will be sufficient if the attention of the central authority be called to cases in which thirty persons of the working class are displaced. In settling schemes for providing new houses in place of those demolished, they would give the central authority full discretion. The committee recommend that the new houses to be provided be suitable for persons of the labouring class, and not of an ambitious in character and design; and to these conditions they attach much importance. They would leave wholly to the discretion of the central authority the selection of the area in which the new habitations are to be provided. "It may be, and we think will, be found expedient in some cases to erect houses at some considerable distance from the houses demolished, and not necessarily within the jurisdiction of the same local authority." Further, the committee recommend that in London the central authority be empowered to fix rents for the new dwellings, this decision having been arrived at on division by six votes to three.

The purport of the new model clause for London is to make it the duty of the company or local authority bringing forward any scheme to provide new and suitable dwellings for the persons displaced, and with this intent plans and necessary information must be submitted to the Secretary of State, who will, before issuing his certificate approving of any scheme,

on it to the London County Council and any other local authority appearing to him to be concerned therein. If the person fails to furnish the memorandum required they will be liable to a penalty not exceeding 500l. Moreover, "If the person, without having obtained a certificate from the Secretary of State or his approval of a scheme, or in contravention of any provisions of any scheme, displace any persons of the working class from any house, or use for the purposes of undertaking any land in respect of which a housing obligation has arisen, they shall be liable to a penalty not exceeding 500l. in respect of every such house." The expression, "labourers" is defined to mean "mechanics, artisans, labourers, persons working for wages, hawkers, costermongers, persons working for wages but working at some trade or handicraft not employing others except members of their own family, persons other than domestic servants whose income does not exceed an average of 30s. a week, and the families of any persons who may be residing with them." In the clause relating to places outside London the approval of the Local Government Board is required.

In Mr. Troup's evidence reference was made to the possibility of removing factories from London into the country. The witness said:—I have here some figures which show to what extent it might be possible to relieve the congestion in London by the removal of factories to the country. The figures have been supplied by the Factory Department. I find that there are 748 factories in London employing more than 20 people—the total number employed in those factories is about 200,000. That, no doubt, would represent—taking one person, say, to each employé—a population of about 200,000 at the least.

Lord Lamington: Which London does this represent?—The county of London, the administrative county. In order to judge as to which classes of factories might be made the subject of removal to the country they are classified to a certain extent: for instance, there are fifty shoe makers' factories, thirty bread and biscuit factories, ten cabinetmaking factories, eleven factories making toys from fruit, sixteen breweries, forty-seven book-binding establishments, seventy-two printing establishments (including newspapers) and nineteen saw mills, and so on. I have ascertained that in those classes of factories there is already a very considerable tendency to remove them to the country. For instance, the very largest cabinetmakers in London have recently removed their houses to the country.

These figures are given merely to show that there is a considerable scope in the possible removal of factories from London to the country if that could be in any way under the scheme arranged with the railway companies or other companies. In reply to a further question, Mr. Troup said that personally he considered this the chief element in the solution of the working-class difficulty in London.

Dr. Manfield Robinson, town clerk of Shoreditch, explained to the committee how the high prices demanded for sites prevented the carrying out of housing schemes in the borough. Land was worth 20,000l. to 30,000l. per acre. That was what it cost to acquire the Morten Place area, and the large area of three or four acres called the Stonebridge estate would cost about the same amount, and that was in the northern part of Haggerston, the cheapest place for land in Shoreditch. Hence the local authorities had come to the conclusion that unless they could buy land more cheaply it would be impossible to build houses for the working-classes. The witness looked for relief to electric and other suburban railways. In his opinion the welfare of the children was the all-important matter. "The question of whether a man has to wait about for an hour when he comes to business owing to a train getting him there earlier than he wants is, in my opinion, most infinitesimal compared with the fact of his children having to spend twenty-four hours a day in the slums, in bad atmosphere and under bad conditions." The overcrowding abomination in East London was, he believed, far worse than in any other part of the country. Mr. E. J. Harper, statistical officer of the London County Council, was of opinion that that body should provide the housing accommodation at the expense in certain cases of railway companies and others. The Council had now on hand another of the new streets and improvement schemes, and if the suggestion were carried out, and they could spread the rehousing operations equally over London, he believed they would be able to save at least half a million of money.

#### GOVERNMENT IRON AND STEEL WORKS, JAPAN.

THE following report has been prepared by Mr. Ernest A. Griffiths, of the British Consular Service, on the Imperial Japanese Government Iron and Steel Works at Wakamatsu, in Kiushiu, formally opened on October 18, 1901:—

The necessity of rendering Japan independent of foreign

## CABOT'S INSULATING & DEAFENING QUILT.

### A PERFECT DEAFENER.

Prevents the transmission of sound through walls and floors by absorbing and breaking up the sound waves. The only deafener that does this. See Special Book on Schoolhouse Acoustics, illustrated.

### A SCIENTIFIC INSULATOR.

Contains innumerable minute dead-air spaces, giving highest insulating power. Warmer than back-plaster or six layers of rosin paper. Decay proof, and vermin-proof, and unflammable.

### FIREPROOF, DEADENING.

A fireproofing result infinitely superior to that obtained with sheet asbestos, and practically perfect sound-deadening, can be had in all kinds of buildings by using

### CABOT'S ASBESTOS "QUILT."

The only scientific deafener. Indestructible by decay, moths, or vermin.

countries for her supply of steel and iron manufactures by the establishment of a steel factory has for some years past been recognised in the country. It was not, however, until the year 1890 that anything definite was attempted, and even then, although the question was taken up by the naval authorities and an estimate submitted to the Diet, the attempt proved abortive.

Various reasons were at the time given for the failure of the Government scheme—one to the effect that sufficiently explicit information had not been given to the Diet by the Government as to the amount of iron ore and other raw material which Japan herself could supply to meet the needs of the foundry, another that there had been a difference of opinion on the question of control between the War and Navy Departments. Whatever the reason may have been the proposal was rejected by the House of Representatives. The Upper House, however, was not satisfied to let the matter rest there. It urged upon the Government the necessity for further action, and suggested as a preliminary step that a committee of inquiry and investigation should be appointed. It further gave as its opinion that it would be well if the business of establishing a steel foundry and its subsequent control were entrusted to the Department of Agriculture and Commerce instead of to the naval and military authorities.

This view was adopted by the Government, and a committee was appointed by them to make investigations and report upon the whole question, more particularly as to the "amount of iron ore obtainable in Japan, the trial manufacture of pig-iron and steel, and the organisation of the works."

The committee appears to have been a thoroughly representative one, comprising experienced officials from the War, Finance and Navy Departments, as well as experts from the Mining Bureau of the Department of Agriculture and Commerce and the Tokio University. The investigation occupied about five years, and as a result, and after a successful trial manufacture of iron had been made at Kamaishi, in Rikuchu, the Government decided to establish a steel works in Japan, and with that object submitted a Bill to the Diet at the beginning of 1896, asking for an appropriation of 4,095,793 yen, to be voted as a continuing fund spread over four years. The scope of the works was to be sufficient to turn out 60,000 tons of steel of various kinds, or less than one-half of the total quantity—130,000 tons—required at the time. In the Government estimates 300,000 yen was set apart for the purchase of the necessary ground, 100,000 yen for the preparation of the

site, and 560,500 yen for building purposes. The Government proposals were unanimously passed by both Houses of the Diet, and it was decided to entrust the control of the undertaking to the Department of Agriculture and Commerce, as suggested five years previously by the House of Peers.

After the claims of Ujina, Hakata, the Hok-Kaido and Wakamatsu, in Chikuzen, to be selected as the site for the works had been severally considered, the last-named place was eventually chosen, and on March 30, 1896, the organisation of the steel foundry was officially announced by imperial decree. The staff, exclusive of workmen and artisans, to consist of a president, with a salary of 4,000 yen a year, one chief engineer with a salary of 3,000 yen a year, two managers with a salary of 2,000 yen a year each, eight experts with salaries averaging 1,200 yen a year, and thirty clerks and forty assistants with an average monthly wage of 30 yen. Provision was also made for the employment of foreign experts and two German engineers were engaged.

Mr. Teiun Yamanouchi was appointed the first president of the foundry, and Mr. Michitaro Oshima chief expert, while Messrs. Taishin Nagao and Michisaburo Miyashita were appointed managers. On the resignation of Mr. Yamanouchi in August, 1897, Mr. Rentaro Hotta, chief engineer of the Mining Bureau, was placed in charge, to be succeeded a few months later by Mr. Tsunashiro Wada, the present president.

At the time of the inception of the undertaking Mr. Wada was director of the Mining Bureau in the Department of Agriculture and Commerce, and was one of the original members of the committee of inquiry appointed by the Government in 1892. He was consequently thoroughly acquainted with the details of the scheme, with the origin of which he was so closely identified, and it was, I believe, on his initiative that the original idea that the foundry was simply required to manufacture military and naval requisites for the Government was altered, and a programme of a more general scope adopted.

In the meantime experts had been despatched to Europe and America to inquire into the condition of the steel works in various foreign countries, and to obtain expert opinion abroad as to the new undertaking. As a result of these inquiries it was found that the original estimates of the cost were far too small, and in 1898 the Government obtained from the Diet an additional sum of 6,474,056 yen towards the expense of the work, while in its thirteenth session (February 1899) the Diet was asked to vote a further sum of 8,632,845 yen, including

yen for working capital, 3,632,845 yen for the acquisition and their improvement, and 500,000 yen as a total thus appropriated for the establishment of the works are known as the Imperial Japanese Government and Steel Works, and are situated close to the town of Wakamatsu, in Chikuzen, in the north-west corner of Kiushiu, the locality being Yawatamachi, Ougagori, in the Prefecture of Fukuoka. The nearest railway station is at Okura, 14 cho, or about one mile, from Wakamatsu. Wakamatsu itself lies nine miles to the west of Moji, the well-known coal-pit on the Shimonoseki Straits, the northern terminus of the Kiushiu Railway. The ground occupied by the steel works, in area close upon 1000 tsubo (or about 248 acres), with an additional lot of 1000 tsubo (over 74 acres) for enlargement purposes, on the eastern side of a large lagoon 10 miles in circumference. This lagoon adjoins and is connected with a pool or bay about a mile in diameter at its greatest width, which is connected with the sea by a short and narrow channel, the west side of which is situated the town of Wakamatsu. The lagoon is for the most part very shallow, but is to be dredged and deepened by the Harbour Works Company preferred to. The present depth, which is about 8 feet, is to be increased to 20 feet, and a quay wall over 1000 feet long is being built along the front of the works. The commercial benefit which Wakamatsu might possibly derive from its proximity to the coal-fields of Chikuzen and in the completion of the Kiushiu Railway system, was recognized even before the place was considered as a site for a permanent steel works. It suffered, however, from the disadvantage of having a very shallow harbour, and it was consequently necessary that something should be done to render it easy of access from the sea before it could become the great port which its situation warranted one in believing it could eventually become. In November 1888 therefore authorities were requested to sanction the organisation of a company to conduct the work of deepening the harbour, which at that time was only about 5½ feet deep in the shallowest part. An investigation was made, and Mr. Isoji, an engineer of the Home Department, in a report on the proposed dredging, issued by him in November 1888 stated that a capital of 600,000 yen would be required, and a breakwater 2,245 yards long should be constructed, and

that the shallowest parts, both within and outside the harbour, should be dredged. He suggested that the expense of undertaking the work could be met by the levying of dues on ships entering the harbour, and by the disposal, either by sale or lease, of the land which would be reclaimed in the course of the work. In May 1900 official sanction was obtained, and the Wakamatsu Harbour Works Company was organised. The work of dredging was commenced some time afterwards, and by June 1893 a depth of over 8 feet had been obtained. In April 1894 official sanction was given to the company to charge dues on ships entering the harbour. In May 1896 it was resolved to extend the dredging operations in view of the fact that the Government had selected Wakamatsu to be the site of the new steel foundry. As considerable inconvenience was caused, however, by the collection of shipping dues from every ship entering the port with materials for the construction of the Government works, it was in December 1899 agreed between the Government and the Harbour Works Company that the fees should be abolished in the case of such ships, and that in lieu thereof a sum of 500,000 yen should be paid by the Government to the company during a period of five years. The company thereupon increased its capital to 1,500,000 yen, and further extended the scope of its work. As a result the whole of the Wakamatsu Harbour will be dredged to a depth of 20 feet, and ships of 3,000 tons displacement will be able to approach the quay wall belonging to the steel works and load and unload cargo alongside.

The work already (December, 1901) completed consists of a channel 6,000 feet long, 240 feet wide and 14 feet deep, extending from the main channel outside the harbour to the Kiushiu Railway Company's pier. The greater part of the breakwater has also been completed.

The quay is connected by a branch line with the main line of the Kiushiu Railway, as well as with all parts of the works, the length of railway lines within the works amounting to about 20 miles. The gauge in use is the same as in other parts of Japan, and trucks can consequently be transferred from the Kiushiu Railway lines to the lines in the works, and taken to any part of the latter.

The machinery for loading and unloading ships or railway waggons consists of:—Two 1½-ton electric movable portal cranes, one 25-ton quay crane, fixed, driven by electricity, and one 10-ton shear-leg, hand worked.

Water is brought by conduit from the Itabitsu River near Okamwa, Ougagori, and distributed by the same means all over

the works. The length of the conduit is about  $2\frac{1}{2}$  miles, and the average amount of water supplied is 1,200 gallons per minute. For the purpose of storage two reservoirs have been built.

The works are divided into three departments: (1) the pig-iron department; (2) the steel department, and (3) the rolling-mill department. In addition to these there are a central pumping station, an electric central building, a repair shop, an iron foundry, a pattern shop and foundry, sand storage, a boiler shop, smithy, chemical and mechanical laboratory and inspection bureau, and firebrick plant. There are also, of course, offices and dwelling-houses as well as a hospital. The various buildings are all lighted, both outside and inside, by electric light, about 120 arc and 1,000 incandescent lamps being used.

Steam, electric and hydraulic power is used in the works, the first, except in the case of locomotives, being produced in steam boilers fired with waste gas from blast furnaces and coke ovens. Altogether twenty-four steam engines of 31,200 horse-power and fifty-two steam boilers of about 10,000 horse-power are used in the works.

I am informed that all the machinery used in the works, with the exception of the electric cranes which were made in America, came from Germany.

It may be mentioned here with reference to the offices, hospital and houses, &c., that the head office is a two-storeyed brick building, covering an area of 720 square metres, that the hospital building covers an area of 872 square metres, and that the officers' quarters occupy ground to the extent of about  $3\frac{1}{2}$  acres.

The dwellings for the workmen and their families are built of wood and occupy a space of about  $5\frac{1}{2}$  acres.

The raw material used in the works—magnetite, hematite and a smaller quantity of zimonite—is all obtained in Japan, with the exception of the portion of the ore which is supplied, under contract, by the Hang-Yang Iron Works from their mines in Dayeh, Hupeh, China. Japanese iron ore comes principally from the Akadani and Kamo iron mines in Echigo, which have been purchased by the works, and in smaller quantities from other mines. It is expected that the Akadani mine when in full working order will turn out about 100,000 tons of ore annually, while the amount to be supplied by the Chinese mine, under contract, is from 50,000 to 70,000 tons per annum.

In addition to the two iron mines mentioned above the works have also purchased for their use three coal mines, the Takao, Igisu and Uruno in Kahogori, Chikuzen, all within

30 miles of the works, and connected with the latter by rail. Coal is also obtained from various private mines in Japan.

It is estimated that the amount of iron ore required for consumption every year, when the works are in full working order, will be 250,000 tons, and that the amount of coke and coal consumed will be 380,000 and 800,000 tons respectively.

As regards the cost of the iron ore, it was recently stated in the "Jiji shimpo" that in February last the Hang-Yang Iron Works supplied from their mine 60,000 tons of iron ore at a cost of from 2 yen 50 sen to 3 yen per ton at the mine, the freight thence to the Wakamatsu works averaged 50 sen. The total cost of the ore per ton at the works amounted, therefore, to from 7 yen to 7 yen 50 sen, and was the cheapest ore supplied. It is estimated, however, when arrangements have been completed for bringing ore from the Akadani mine, the cost of the ore laid down at the works, i.e. freight and other charges included, will be about 5 yen per ton.

According to a recent official announcement the works intended to supply, as far as possible, all the steel materials required by the Government at a price to be arranged annually in advance, irrespective of the current foreign market prices. Certain kinds of steel materials will also be supplied, but only in large quantities to Japanese engaged in industrial business at a price lower than the cost of imported articles. The terms at which the Government will be supplied is to be determined in advance by arrangement with the official department requiring the materials, on the basis of the average prices ruling abroad during the immediately preceding five years, the state of the work at the foundry being also taken into consideration.

In February last the manufacture of pig iron was commenced, and in May Siemens's steel was turned out in an amount of about 40 tons a day. Towards the end of June of the five roll mill plants having been completed, the production of medium and small rails and plates was started.

Speaking at an inaugural banquet held in Tokio in June last, Mr. Wada, the president of the works, stated, according to a report in the *Japan Times*, that the experiments that had been made had proved the efficiency of the works for the production intended, and as 90,000 to 100,000 tons of steel could be provided in a year when all the arrangements had been completed, and the operations could be carried out to the full extent, he was confident that the profit realised from the works might cover in a reasonable space of time the capital invested in this important and novel industry in Japan.

# The Architect.

## THE WEEK.

As far as can be judged from two days' proceedings the Sanitary Congress at Manchester appears likely to obtain phenomenal success. This year the communications are of unusual interest. The Sanitary Institute has been able to secure the co-operation of several architects, and the papers they have produced for the occasion have a directness of applicability which does not always characterise the essays read on similar occasions. There are several topics which demand discussion. Some of the recent legislative measures have not been successful, and at present there is a possibility that the Factory Acts will not be as efficacious as was expected. There is no subject which has more public interest, and yet through a variety of causes the working of the Act has been carried out in a manner which has not made the owners of factories anxious to put their buildings in order.

In America and Canada there is a law by which workmen can have, if wages are not regularly paid, a lien or claim on the buildings they construct. In some parts of the United States the lien has precedence over mortgages, but in others it follows the mortgages. What position does the architect hold in such a transaction? A case of this kind was lately decided in the High Court of Justice, Toronto. The plaintiff, who was a workman, made an action against the owner of the property and on the architect. With the object of having the architect's certificate aside, or damages recovered, counsel for the architect claimed that the action against him should be dismissed on the ground that there was no cause. The Court held that the architect was neither a contractor nor a wage-earner, a supplier of materials, an owner, nor a mortgagee, he could have no part in an action to realise a lien. An action may be taken against the architect, but it must be under some other Act than the Mechanics and Wage Earners' Lien Act.

From time to time there are announcements of new brick-laying machines which are expected to dispense with manual labour, but as one of the commercial agents of the Government of the United States has reported a recent invention in Canada which has been endorsed by the State Department, it may be assumed to be more than rumour. According to the agent, "the machine, worked by two men in a lad, will lay 400 to 600 bricks per hour. Door and window spaces cause only a slight delay. The machine is suited for all plain work, such as walls, sheds, mills, factories, rows of cottages, piers of bridges, &c. Considerable pressure is put on the bricks, and it is claimed that the work is more firmly done than by hand. The invention will do the work of six or seven skilled bricklayers, and it is believed that a machine adapted to build a factory covering only 40 feet could be put on the market for 500 dollars. The apparatus can be readily worked after a fortnight's instruction." It has yet to be seen whether the machine will serve for brickwork on a small scale; but the endeavour of bricklayers to increase the cost of work by the slowness of their operations is an inducement to inventors to create something which will diminish the necessity for workmen.

The effectiveness of the Krupp works at Essen can be judged from the following statistics:—In 1901 the plant consisted of 5,300 machine tools and workshop appliances, 24 trains of rolls, 141 steam hammers, 63 hydraulic presses, 10 of them bending presses of 7,000 tons each, one rolling press of 5,000 tons, and one of 2,000 tons effective force—327 stationary boilers, 513 steam-engines, with a total of 36,561 horse-power, 269 electro-motors and 591 cranes. There are no less than 43,083 persons employed by the firm. A census is occasionally taken, and in May 1901 it was found that the total number of persons connected with the works, including the wives and children of the employés, was 147,645. The business was started in 1811, and the first furnace for the manufacture of cast steel was erected. For fifteen years the experiment was unprofitable. The management is in the hands of fourteen directors.

ONE of the troubles of borough engineers in manufacturing towns arises from trade effluents in sewers. The fluid may deteriorate the brickwork or cement or it may have an effect on sewage, and increase the expense of purification or utilisation. On the other hand, interference with the processes of trade may offend the most important class of property owners, and cause the removal of industries. It is mainly owing to the latter consideration that the Prevention of Pollution Act has produced so little benefit. A case has been for a year under deliberation with the Manchester Corporation which exemplifies how hard it is sometimes to arrive at a decision on such subjects. In May 1901 there was an explosion in Miles Platting which excited some commotion as well as damage. A special sub-committee was at once appointed to consider the circumstances. There was no difficulty in discovering the origin of the affair. The Manchester Oxide Company stated that the explosion was due to the accidental ignition by their workmen of vapours of carbon bi-sulphide which had inadvertently escaped from their works. The leakage of carbon bi-sulphide was due to the firm being under the impression that the drain down which this liquid escaped led to a safety storage reservoir, whereas it was afterwards found to lead direct into a sewer. The expense of repairs was not more than 30%. A long investigation followed in order to prevent similar dangers. Finally it was decided to seek powers to prohibit any matters being discharged into the sewers which are injurious to the health of the workmen employed in the sewers, or which may cause a nuisance in the districts through which the sewers pass. Upon these powers being obtained, it is hoped that the risk of such occurrences as led to the formation of the special sub-committee will be very considerably minimised.

For the wood paving of Paris several varieties of timber are employed. Not only France but Florida, Norway, Australia, Borneo, Annam, &c., contribute materials. The blocks are prepared near the riverside beyond the Pont Mirabeau, and creosoted in municipal workshops. The cost to the city is from 15 frs. to 18 frs. a square metre. The annual outlay for keeping up of roads controlled by the city is about 1.45 fr. per metre, while in those for which a contract is let it amounts to 2.57 frs. The wood lasts about nine years, but it is expected that the block will have a longer duration if a machine lately invented for planing and cleaning the surface becomes a success.

THE name of CHARLES LANYON is not likely to be often mentioned during the meeting of the British Association in Belfast. Yet there is no doubt that the present appearance of the city was mainly determined by his skill as an architect and as an engineer. Another element of the success of Belfast arises from the fact that owing to financial difficulties the DONEGAL family, or rather their creditors, were compelled to dispose of their interests, and that the sites were purchased in most instances by occupiers. That happened about fifty years ago. Belfast is thought to be a corruption of an Irish term meaning the mouth of the ford. To protect the pass a castle seems to have been erected at the beginning of the fourteenth century. But the wars with the native Irish retarded the progress of the place. The Earl of ESSEX was one of the first to realise the advantages of the site, and he recommended that a dockyard should be constructed. It was not until Sir ARTHUR CHICHESTER, the founder of the DONEGAL family, was appointed Lord Deputy that Belfast became the nucleus of a town. Then its progress was unsurpassed in Ireland. The town had, however, to suffer much in the troubled times which followed, and it was only in the reign of WILLIAM III. that its position could be considered as secure. CHARLES LANYON held manifold offices, and under the circumstances that was an advantage. He was county surveyor, harbour engineer, city architect, and he enjoyed the largest private practice. He was able to mould various public bodies to his will, and induced them to combine in the improvement of the town and the river Lagan. He had the satisfaction of feeling, when his end approached, that he left a very different Belfast from that which he first knew, and the important works which have since been carried out may be regarded as no more than a realisation of his projects.

PAINTERS' ARCHITECTURE: PHILIPPO LAURI.

### THE ROYAL INSTITUTION.

THE appointment of Professor JAMES DEWAR as president of the British Association for the Advancement of Science is a compliment not only to the physicist who has been able to give a certain degree of permanence to liquefied gases, but to the Royal Institution, with which he has been connected for some years. He has carried on the traditions of YOUNG, DAVY, FARADAY and TYNDALL, and in that way has upheld the reputation of the Institution. Some months ago CARL SNYDER said "it would be hardly too much to say that during the hundred years of its existence the Royal Institution alone has done more for English science than all of the English universities put together." The Institution which has accomplished such important work depends mainly for its existence on the subscriptions of the members, and during the century of its activity the expenditure has been 100,620%. That is an average of 1,000% per annum, and the sum would be inadequate if the professors who have taught and experimented were not enthusiasts and capable of undergoing great sacrifices for the promotion of science.

It is well, however, to remember that the man to whom the foundation is principally due was a New Englander. His family name was THOMPSON, but he is generally known as Count RUMFORD. He fought on the British side in the American Revolution, and for his services he obtained an appointment in England. He had a genius for social projects, but England was too conservative to entertain them. He therefore entered the service of the King of BAVARIA, by whom he was created a count. He used to visit England occasionally. With his aid the Royal Institution of Great Britain was established in 1799 and incorporated in 1800. Its objects were described as "the diffusing of knowledge and facilitating the general introduction of useful mechanical inventions and improvements, and teaching by courses of philosophical lectures and experiments the application of science to the common purposes of life." Although the popularising of science has been the chief purpose of the Society, of late years a wide scope has been allowed to lecturers, and art, literature, archaeology, philosophy and other subjects have been treated.

The versatile THOMAS YOUNG was the first philosopher attached to the Institution. He was not an attractive lecturer, and his genius was in consequence unappreciated by the majority of his contemporaries, and does not receive much recognition in our age. ARAGO declared him to be one of the greatest of English men of science. There were few branches of science as then known with which he was not acquainted. The reports of his lectures on natural philosophy exemplify the precision of his knowledge, and Egyptologists are indebted to him for his interpretation of the Rosetta inscription, which led to a revelation of hieroglyphics.

HUMPHRY DAVY possessed qualities in which YOUNG was deficient. He was only twenty-three when he first appeared as a lecturer before the Royal Institution, but at that time he had won a reputation for his researches, theories and discoveries. His lectures on galvanism and

electro-chemical science were novelties to the members. DAVY was imaginative, and his descriptions of natural phenomena were examples of a noble variety of eloquence in which great effects were produced by the use of simple language. Pure science could not be expected to draw large audiences, however ably treated, but with DAVY there was always expectation of discoveries which could be turned to account in manufactures. In that way it was believed to be profitable to pay attention to all he said.

His most valuable discovery was the philosophic genius MICHAEL FARADAY, who came to him in the guise of a working bookbinder. FARADAY had not such an education as DAVY received, and he could not have acquired the self-confidence which is a privilege of members of the medical profession. He never forgot that he belonged to a humble class, and this prevented him from becoming overbearing or arrogant, no matter how important were the fruits of his researches. He was likewise deeply religious, and he never attempted by aid of the Patent Office to enrich himself by any of his applications of science. His ability he regarded as a great trust for the public benefit. His language in lecturing was, if possible, more simple than DAVY's, and he was so unassuming that many people were unable to realise his extraordinary power.

JOHN TYNDALL, who came next, was of a more combative disposition than his predecessors in the laboratory and lecture-room of the Royal Institution, but that quality especially adapted him for a revolutionary age. He was comparatively young man, being only thirty-three, when he was appointed professor of natural philosophy, and for thirty-five years he loyally devoted himself to the Royal Institution. In 1874 he presided at the meeting of the British Association in Belfast, and therefore in more than one way was the predecessor of Professor DEWAR.

On looking back on what was accomplished by YOUNG, DAVY, FARADAY and TYNDALL, at so little cost to the country, Professor DEWAR was justified in saying that the exceptional man is about the cheapest of natural products. But he doubts "whether we can reasonably count upon a succession of scientific men able and willing to make sacrifices which the conditions of modern life tend to render increasingly burdensome. Modern science is, in fact, in something of a dilemma. Devotion to abstract research upon small means is becoming always harder to maintain, while at the same time the number of wealthy independent searchers after truth and patrons of science the style of JOULE, SPOTTSWOODE and DE LA RUE apparently becoming smaller. The installations required by the refinements of modern science are continually becoming more costly, so that upon all grounds it would appear that without endowments of the kind provided by Dr. CARNEGIE the outlook for disinterested research is rather dark. On the other hand, these endowments, unless carefully administered, might obviously tend to impair the single-minded devotion to the search after truth for its own sake, to which science has owed almost every memorable advance made in the past. The Carnegie

stitute will dispose in a year of as much money as the members of the Royal Institution have expended in a century upon its purely scientific work."

Professor DEWAR's discoveries of the liquefaction of gases has increased the renown of the Institution with which he has been connected since 1877. Three years before that time he had read a paper to the British Association on the latent heat of liquid gases. The subject was a wide one, and was the last which occupied the attention of BACON. He had said that the production of cold was worthy of inquiry for the use and the disclosure of causes, "for heat and cold are nature's two hands whereby she chiefly worketh, and heat we have in readiness in respect of the fire, but for cold we must stay till it cometh to seek it in deep caves or high mountains, and when all is done we cannot obtain it in any great degree, for flames of fire are far hotter than a summer sun, but vaults and hills are not much colder than a winter's frost." But he could not think of any natural phenomenon without having the desire to turn it to account for the benefit of man. Accordingly on a snowy day in 1626 it struck him that cold substances might be used to prevent putrefaction. He went into a cottage at Highgate, bought a fowl, and with his own hands filled it with snow. BACON caught a chill during the operation. He had to be carried to Lord ARUNDEL's mansion, and there, after a week's illness, he expired. To the end his thoughts were with his experiment, which he described as succeeding "excellently well." Fifty-six years afterwards we find ROBERT BOYLE investigating cold by means of mixtures of snow or ice and salt. But the search after the *primum frigidum* was too laborious for a fine gentleman, and the conclusion of it was left to others. In our time many investigators have been engaged on the subject. Much has been ascertained, and the problem at length was so far narrowed as to become "not so much how to produce intense cold as how to save it when produced from being immediately levelled up by the relatively superheated surroundings. Ordinary non-conducting packings were inadmissible because they are both cumbrous and opaque, while in working near the limits of our resources it is essential that the product should be visible and readily handled."

At length in 1892 Professor DEWAR tried the effect of keeping liquefied gases in vessels having a double wall, the annular space between being very highly exhausted. The experiment was a success. Several forms of vessels have been devised, and liquid air can now be sent in them across the Atlantic.

It is impossible to foretell all the applications of the discovery which may arise. The connection between different varieties of cosmic force becomes more apparent on all such additions to our knowledge. We may learn more of heat, which is one of the great working powers of nature, by means of the qualities of cold. Then there are thermo-electric and other agencies from which we may derive more advantage by the changes which are suggested in the liquefaction of gases. New experiments have been made on living organisms, and it is remarkable that as regards putrefaction, instead of freezing succeeding "excellently well," as BACON reported, liquid hydrogen and liquid air do not affect the vitality of the lower forms of life. It has been found that many kinds of micro-organisms can again be exposed to the low temperature for six months without any loss of vitality. As Professor DEWAR says:—"At such a temperature the cells cannot be said to be either alive or dead, in the ordinary acceptation of these words. It is a new and hitherto unobtained condition of living matter—a third state." Such modest rewards as scientific institutions can confer have been received by him, and it was fitting that among them should be the Rumford medal and the Hodgkins medal, which recall two worthies who enriched the Royal Institution.

A Group of windows, consisting of a rose window and five lancets—which are in two rows below the rose window—has recently been placed in the south transept of Westminster Abbey as a memorial to the late Duke of Westminster. The group has cost nearly 2,400*l.*, which has been raised by public subscription. The windows have been designed by G. F. Bodley, A.R.A.

## THE ENCYCLOPÆDIA BRITANNICA.\*

THE fifth volume of the supplement to the "Encyclopædia Britannica" has a prefatory essay on "The Application of the Doctrine of Evolution to Sociological Theory and Problems," by Mr. BENJAMIN KIDD, the author of some able books on the system. He supports the assumption that "the welfare of citizens cannot rightly be sacrificed to some supposed benefit of the State, but, on the other hand, the State is to be maintained solely for the benefit of citizens. The corporate life must be subservient to the lives of the parts, instead of the lives of the parts being subservient to the corporate life." It is stated by Mr. KIDD that the changes in the application of evolution to sociological theory are only in their initial stages. It is suggested by him that advanced races at the present day are representative in virtue of qualities in the minds of those who preceded them which had no relation to current environment. In other words, utilitarianism may become less dominant than formerly. In that case art will have a chance, for it will no longer be controlled or compelled to demonstrate its right to existence by the *cui bono* principle.

Meanwhile the utility test is sure to prevail. As evidence of its power there is nothing more remarkable than the extensive use of iron and steel which is described in an article by Professor HOWE, of Columbia University. He tells us that within the last twenty years of the nineteenth century the world's production of pig-iron more than doubled, and that of steel increased fivefold. In 1880 the production of wrought-iron in the United States was 70 per cent. greater than that of steel, while now the quantity of steel is six times that of wrought-iron. The necessity of thoroughly consolidating steel in masses has had the effect of reviving the application of the hydraulic press, and for some purposes it is found to be preferable to the steel hammer. The Professor says:—

The demand for very large forgings, especially for armour-plate and ordnance, has led to the erection of enormous steam-hammers. The falling parts of the largest of these, that at Bethlehem, Pa., weigh 125 tons. But even so great a hammer is an ineffective tool for making large forgings, chiefly because the effect of its blow is concentrated on the outside of the forging, and does not penetrate well towards the interior; indeed, the days of large hammers seem to be over. The use of this particular one has been abandoned for that of an enormous hydraulic press which exerts a pressure of 14,000 tons. It is moved by water under a pressure of 7,000 lbs. per square inch, supplied by pumps of 16,000 horse-power. For forging shafting and other objects not readily made in rolling mills, because their cross-section is not uniform, the hydraulic press seems to be firmly established as by far the most efficient tool. But though the great 14,000-ton Bethlehem press is used with great success for forging armour-plate also, the rolling-mills certainly has special merits for such a purpose, and with it all of Krupp's armour-plate is now made. The rolls of this great armour-plate mill are 4 feet in diameter and 12 feet long, and can receive an ingot 4 feet thick.

As the fifth volume comprises terms between Glarus (Switzerland) and Jutland, several articles relate to geography. It is satisfactory to learn that since 1880 authority was given for the erection of buildings having a value of about 18,000,000*l.* in Glasgow, and of that sum one-third belongs to the years 1896-99. Greece is recorded as having made sensible progress since 1870. There has been an increase in the rate of population; no less than 22.3 per cent. of the people live in towns. As in the old days, owners of estates prefer to dwell there, and are indifferent to their tenants. The imports in 1898 were nearly double the value of the exports. In the trade with Great Britain the imports during 1897 were 29,486,910 frs., the exports being 26,763,302 frs. There are no manufacturing industries on a large scale. Mr. BOURCHIER affirms that with improved communications and tranquillity the number of visitors to Greece would be multiplied, and thus profit would be derived from the natural and historic attractions. The article on Holland suggests that technical education has taken a hold on that staid country. They

\* The new volumes of the *Encyclopædia Britannica*, constituting in combination with the existing volumes of the ninth edition the tenth edition of that work, and also supplying a new, distinctive and independent library of reference dealing with recent events and developments. The fifth of the new volumes, being volume xxix. of the complete work. (Published by the *Times*, London.)

have a school for engineers, schools of commerce, horticulture, dairywork, industrial art, music, dramatic study, painting and architecture. As many as 120,975 workers were found by the latest census to be occupied on building. Industry has been promoted through the exhibitions, museums and schools. In 1875 there were 770 miles of railway, and in 1898 the mileage had increased to 1,900. It is interesting to learn that in Honolulu, the capital of the Hawaiian Islands, "the public buildings would do credit to any civilised country." It has also a flourishing art league which exhibits twice a year.

Hungary, in spite of the political discussions, also realises the necessity of technical education. At Budapest 34 professors and 74 lecturers are engaged at the Polytechnicum. There are also 45 art schools with 337 teachers. In the description of India we are told that little demand is made for the services of engineers; for several years there has been no addition to the engineering colleges and the number of students has not exceeded 667. Sanitation is still in a backward state in India; there are sanitary officers, but unless plague visitations are accepted as object-lessons little hope of improvement can be entertained. It is believed, however, that the "sleeping princess has arisen and moves forward, though with dazed eyes and uncertain steps, encumbered by the folds of her old-world garment. In confidence, yet not without hesitation, she follows a stranger into a world that is new and unimaginable to her." Italy, if tested by statistics, has given undoubted evidence of progress. The number of motors has increased from 14,502 in 1890 to 20,472 in 1898. Electric power has been doubled. The advancement is seen also in particular industries. We are told that "furniture-making in different styles is carried on all over Italy, especially as a result of the establishment of industrial schools. Each region produces a special type, Venetia turning out imitations of sixteenth and seventeenth-century styles, Tuscany the fifteenth century or Cinquecento style, and the Neapolitan provinces the Pompeian style. Furniture and cabinet-making in great factories are carried on particularly in Lombardy and Piedmont. Bent-wood factories have been established in Venetia and Liguria." In no part of the world described in the volume has more been accomplished within a few years than in Japan. We hear so much of late about house-taxes and impediments which prevent foreigners from building; it is well to have a clear statement on the subject. Captain BRINKLEY, in his article, says:—

Foreigners are not at present permitted to own land in Japan in their individual capacity. The forms of tenure lawful for them are (1) tenure by ordinary lease; (2) tenure by superficies; and (3) tenure by ownership as a juridical person. Tenure by ordinary lease is limited to twenty years (subject to renewal), and the lessee is entitled to use and enjoy the object of the lease, whether land or buildings, under conditions substantially the same as those prescribed by English law, except that buildings, fixtures, trees and plants placed there by the tenant may be removed by him at the termination of his lease. Tenure by "superficies"—a term which does not accurately represent its Japanese original, "superficial right"—is, in effect, a lease for purposes of building or planting. Such a lease may be for any term of years, fixed according to the convenience of the contracting parties, and the lessee (superficiary) is absolutely guaranteed against disturbance throughout that period—whether it be fifty or a thousand years. Even though the owner mortgages or sells the land before the expiration of the period, the rights of the superficies are not affected, and the superficies on his side may assign his superficies without prejudice to the rights of the owner. In short, this kind of tenure differs from actual ownership in name only. As to ownership by a juridical person, it is to be noted that the term "juridical person" signifies an association of two or more individuals of any nationality, or of mixed nationalities, formed for commercial, industrial or certain other purposes registered in Japan, and carrying on business according to the provisions of Japanese law. Such an association in its corporate capacity may own land. Thus two or three foreigners contemplating the erection of a factory or mercantile premises in Japan, can become owners of land for that purpose, though as individuals they are not entitled to such a privilege.

The statement seems to refer to straightforward arrangements, but there is no denying the fact that in all matters relating to the ethics of business the Western world has a prejudice against the Japanese. The competition is in consequence supposed to be less dangerous to the pro-

ducers in other countries. From the skill of the craftsmen it is not difficult to make shams which are deceptive, but, on the other hand, many of the merchants with whom the Japanese trade are not examples of probity. It is also remarkable that, in spite of their great industry and ingenuity, they have not that administrative power which is essential in business. The late Mr. ANDERSON, who was a master of the subject, contributed a history of pictorial art, of which the only defect is its briefness. From the character of the common products which are seen in English shops it might be presumed that the efforts of former artists were not valued. But we are informed that "the art of the past has never found a higher appreciation than at present." It is inevitable that Japanese work will be affected by the study of the varieties of Western examples; whether the change will be for the better has yet to be discovered. The modern developments of art are expounded by Mr. E. F. STRANGE.

Biographies form an important part of the contents, and, as it happens, several painters are included. KATE GREENAWAY, we are told, obtained no less than 8,000*l.* for our of her little toy-books. An illustration is given of M. HENNER'S *The Levite Ephraim*, which is one of his characteristic nude figures seen in profile. Of FRANK HILL it is said that the painting which gained the Traveling Studentship in 1868, *The Lord gave, and the Lord hath taken away*, "exhibited nearly all the best technical qualities to which he ever attained, except high finish and clearness and a very sincere vein of pathos." He is compared with JOSEF ISRAELS, who in turn is compared with J. F. MILLET. A plate is given of M. ISRAELS'S *David Singing before Saul* which is unlike the majority of the Dutch artist's works. Mr. J. C. HOOK is represented by his *Luff, Boy!* which Mr. RUSKIN lauded as suggesting the proved weapons in the armoury of England; for, as he said, if the bare head, bare fist, bare foot and blue jacket of the sailor boy will not save us in a war against France or Russia, nothing in the form of machinery will. Mr. R. M. HUNT, the American architect, is described as being "the first to command respect in foreign countries for American architecture, and was the leader of a school that has established in the United States the manner and the traditions of the Beaux-Arts." The career of Mr. HOLMAN HUNT is narrated, and an illustration is reproduced of his *Finding of Our Saviour in the Temple*, now in the Birmingham Art Gallery. The name of GEORGE INNESS, the American landscapist who is not known in England, recalls EMERSON spirit, for it is stated, "Swedenborgianism, symbolism, socialism, appealed to him as they might to a mystic or an idealist. He aspired to the perfect unities and was impatient of structural foundations." He went through a long course of experimenting, and finally seems to have set aside recollections of foreign painters' works and to have represented nature as it appeared to himself.

GEORGES EUGÈNE HAUSSMANN would not be recognised as an artist, but no man exercised so much influence in Paris, and as the city is widely accepted as a pattern for other cities his power was felt elsewhere. He was the son of an Alsatian linen-draper, and strange to say he studied at the Conservatoire in order to become a professional vocalist. Having made himself eligible for office he rose to be a prefect, and his success in organising demonstrations in honour of LOUIS NAPOLEON at Bordeaux caused his promotion to the Prefecture of the Seine. With the aid of ALPHAND he was able to realise his grandiose vision, but in course of time the French grew tired of his improvements, and he retired on the modest pension of 6,000 francs.

Many other articles in the volume could be pointed out with advantage if space allowed. The pages show how much interest belongs to the lives of men most of whom can be looked upon as contemporaries, and to transactions which have occurred within the last twenty years. The tendency of our age is towards specialism, and therefore only a limited segment of life and nature comes within the purview of most men. That may lead to skilfulness, but there is a risk also of narrow-mindedness being the result. An excellent corrective will be found in the pages of the new volumes of the "Encyclopædia Britannica," and in that way the advantage to all classes of readers cannot be easily measured.

## THE BRITISH ASSOCIATION.

ON Wednesday the meeting of the British Association for the Advancement of Science commenced in Belfast. The president, Professor James Dewar, M.A. LL.D., D.Sc., C.S., delivered an address in the course of which he said:—A great man has observed that the "intelligent anticipation of events before they occur" is a factor of some importance in human affairs. One may suppose that intelligent anticipation had something to do with the choice of Belfast as the meeting-place of the British Association this year. Or, if it had not, then it must be admitted that circumstances have conspired, they occasionally do, to render the actual selection peculiarly fitting. Belfast has perennial claims, of a kind that cannot easily be surpassed, to be the scene of a great scientific gathering—claims founded upon its scientific traditions and upon the conspicuous energy and success with which its citizens have prosecuted in various directions the application of science to the purposes of life. It is but the other day that the whole nation deplored at the grave of Lord Dufferin the loss of one of its most distinguished and most versatile public servants of his age. That great statesman and near neighbour of Belfast is a typical expression of the qualities and the spirit which have made Belfast what it is, and have enabled Ireland, in spite of all drawbacks, to play a great part in the Empire. I look upon your thriving and progressive city giving evidence of an enormous aggregate of industrial efforts intelligently organized and directed for the building up of a sound social fabric, and that your great industries are interlinked and interwoven with the whole economic framework of the Empire, and that you are silently and irresistibly compelled to harmonious cooperation by practical considerations acting upon the whole community. It is here that I look for the real Ireland, the Ireland of the future. We cannot trace with precision the laws that govern the appearance of eminent men, but we may at least learn from history that they do not spring from every soil. They do not appear among decadent races or in ages of retrogression. They are the fine flower of the practical intellect of the nation, working studiously and patiently in accordance with the great laws of conduct. In the manifold activities of Belfast we have a splendid manifestation of individual energy working necessarily, even if not altogether consciously, for the national good. In great Irishmen like Lord Dufferin and Lord Roberts, giving their best energies for the defence of the nation by diplomacy or by war, we have complementary evidence enough to reassure the most timid concerning the direction of Irish energies and the vital nature of Irish solidarity with the rest of the Empire. Belfast has played a prominent part in a transaction of a somewhat special and significant kind, which has proved not a little confusing and startling to the easy-going public. The significance of the shipping combination lies in the light it throws on the conditions and tendencies which make such things possible, if not even inevitable. It is an event forcibly illustrating the declaration of His Royal Highness the Prince of Wales that the nation must "wake up" if it hopes to face its growing responsibilities. Belfast may plead with some justice that it, at least, has never gone to sleep. In various directions an immense advance has been effected during the twenty-eight years that have elapsed since the last visit of the British Association. Belfast has become first a city and then a county, and now ranks as one of the eight largest cities in the United Kingdom. Its municipal area has been considerably extended, and its population has increased by something like 75 per cent. It has not only been extended, but improved and beautified in a manner which very few places can match, and which probably none can surpass. Fine new thoroughfares, adorned with admirable public institutions, have been opened through areas once covered with crowded and squalid buildings. Compared with the early fifties, when iron ship-building was begun on a very modest scale, the customs collected at the port have increased tenfold. Since the introduction of the power-loom, about 1850, Belfast has distanced its rivals in the linen industry, which continues to flourish notwithstanding the fact that most of the raw material is now imported instead of being produced, as in former times, in Ulster. Extensive improvements have been carried out in the port at a cost of several millions, and have been fully justified by a very great expansion of trade. These few bare facts suffice to indicate broadly the immense strides taken by Belfast in the last two decades. For an association that exists for the advancement of science it is stimulating and encouraging to find itself in the midst of a vigorous community, successfully applying knowledge to the ultimate purpose of all human effort, the amelioration of the common lot by an ever-increasing mastery of the powers and resources of nature.

The presidential address delivered by Tyndall in this city twenty-eight years ago will always rank as an epoch-making performance. Of all the men of the time Tyndall was one of the best equipped for the presentation of a vast and complicated scientific subject to the mass of his fellow-men. Gifted with the powers of a many-sided original investigator, he had at the

same time devoted much of his time to an earnest study of philosophy, and his literary and oratorical powers, coupled with a fine poetic instinct, were qualifications which placed him in the front rank of the scientific representatives of the later Victorian epoch, and constituted him an exceptionally endowed exponent of scientific thought. In the Belfast discourse Tyndall dealt with the changing aspects of the long unsettled horizon of human thought, at last illuminated by the sunrise of the doctrine of evolution. The consummate art with which he marshalled his scientific forces for the purpose of effecting conviction of the general truth of the doctrine has rarely been surpassed. The courage, the lucidity, the grasp of principles, the moral enthusiasm with which he treated his great theme, have powerfully aided in effecting a great intellectual conquest, and the victory assuredly ought to engender no regrets.

Tyndall's views as a strenuous supporter and believer in the theory of evolution were naturally essentially optimistic. He had no sympathy with the lugubrious pessimistic philosophy whose disciples are for ever intent on administering rebuke to scientific workers by reminding them that however much knowledge man may have acquired, it is as nothing compared with the immensity of his ignorance. That truth is indeed never adequately realised except by the man of science, to whom it is brought home by repeated experience of the fact that his most promising excursions into the unknown are invariably terminated by barriers which, for the time at least, are insurmountable. He who has never made such excursions with patient labour may indeed prattle about the vastness of the unknown, but he does so without real sincerity or intimate conviction. His tacit, if not his avowed, contention is that since we can never know all it is not worth while to seek to know more; and that in the profundity of his ignorance he has the right to people the unexplored spaces with the phantoms of his vain imagining. The man of science, on the contrary, finds in the extent of his ignorance a perpetual incentive to further exertion, and in the mysteries that surround him a continual invitation, nay, more, an inexorable mandate. Tyndall's writings abundantly prove that he had faced the great problems of man's existence with that calm intellectual courage, the lack of which goes very far to explain the nervous dogmatism of nescience. Just because he had done this, because he had, as it were, mapped out the boundaries between what is knowable though not yet known and what must remain forever unknowable to man, he did not hesitate to place implicit reliance on the progress of which man is capable, through the exercise of patient and persistent research. In Tyndall's scheme of thought the chief dicta were the strict division of the world of knowledge from that of emotion, and the lifting of life by throwing overboard the malign residuum of dogmatism, fanaticism and intolerance, thereby stimulating and nourishing a plastic vigour of intellect. His cry was "Commotion before stagnation, the leap of the torrent before the stillness of the swamp."

His successors have no longer any need to repeat those significant words, "We claim and we shall wrest from theology the entire domain of cosmological theory." The claim has been practically, though often unconsciously, conceded. Tyndall's dictum, "Every system must be plastic to the extent that the growth of knowledge demands," struck a note that was too often absent from the heated discussions of days that now seem so strangely remote. His honourable admission that, after all that had been achieved by the developmental theory, "the whole process of evolution is the manifestation of a power absolutely inscrutable to the intellect of man," shows how willingly he acknowledged the necessary limits of scientific inquiry. This reservation did not prevent him from expressing the conviction forced upon him by the pressure of intellectual necessity, after exhaustive consideration of the known relations of living things, that matter in itself must be regarded as containing the promise and potency of all terrestrial life. Bacon in his day said very much the same thing:—"He that will know the properties and proceedings of matter should comprehend in his understanding the sum of all things, which have been, which are, and which shall be, although no knowledge can extend so far as to singular and individual beings." Tyndall's conclusion was at the time thought to be based on a too insecure projection into the unknown, and some even regarded such an expansion of the crude properties of matter as totally unwarranted. Yet Tyndall was certainly no materialist in the ordinary acceptance of the term. It is true his arguments, like all arguments, were capable of being distorted, especially when taken out of their context, and the address became in this way an easy prey for hostile criticism. The glowing rhetoric that gave charm to his discourse and the poetic similes that clothed the dry bones of his close-woven logic were attacked by a veritable broadside of critical artillery. At the present day these would be considered as only appropriate artistic embellishments, so great is the unconscious change wrought in our surroundings. It must be remembered that, while Tyndall discussed the evolutionary problem from many points of view, he took up the position of

a practical disciple of nature dealing with the known experimental and observational realities of physical inquiry. Thus he accepted—as fundamental concepts the atomic theory, together with the capacity of the atom to be the vehicle or repository of energy and the grand generalisation of the conservation of energy. Without the former, Tyndall doubted whether it would be possible to frame a theory of the material universe; and as to the latter he recognised its radical significance in that the ultimate philosophical issues therein involved were as yet but dimly seen. That such generalisations are provisionally accepted does not mean that science is not alive to the possibility that what may now be regarded as fundamental may in future be superseded or absorbed by a wider generalisation. It is only the poverty of language and the necessity for compendious expression that oblige the man of science to resort to metaphor and to speak of the laws of nature. In reality, he does not pretend to formulate any laws for nature, since to do so would be to assume a knowledge of the inscrutable cause from which alone such laws could emanate. When he speaks of a “law of nature” he simply indicates a sequence of events which, so far as his experience goes, is invariable, and which therefore enables him to predict, to a certain extent, what will happen in given circumstances. But, however seemingly bold may be the speculation in which he permits himself to indulge, he does not claim for his best hypothesis more than provisional validity. He does not forget that to-morrow may bring a new experience compelling him to recast the hypothesis of to-day. This plasticity of scientific thought, depending upon reverent recognition of the vastness of the unknown, is oddly made a matter of reproach by the very people who harp upon the limitations of human knowledge. Yet the essential condition of progress is that we should generalise to the best of our ability from the experience at command, treat our theory as provisionally true, endeavour to the best of our power to reconcile with it all the new facts we discover, and abandon or modify it when it ceases to afford a coherent explanation of new experience. That procedure is far as are the poles asunder from the presumptuous attempt to travel beyond the study of secondary causes. Any discussion as to whether matter or energy was the true reality would have appeared to Tyndall as a futile metaphysical disputation, which, being completely dissociated from verified experience, would lead to nothing. No explanation was attempted by him of the origin of the bodies we call elements, nor how some of such bodies came to be compounded into complex groupings and built up into special structures with which, so far as we know, the phenomena characteristic of life are invariably associated. The evolutionary doctrine leads us to the conclusion that life, such as we know it, has only been possible during a short period of the world's history, and seems equally destined to disappear in the remote future; but it postulates the existence of a material universe endowed with an infinity of powers and properties, the origin of which it does not pretend to account for. The enigma at both ends of the scale Tyndall admitted, and the futility of attempting to answer such questions he fully recognised. Nevertheless, Tyndall did not mean that the man of science should be debarred from speculating as to the possible nature of the simplest forms of matter or the mode in which life may have originated on this planet. Lord Kelvin, in his presidential address, put the position admirably when he said, “Science is bound by the everlasting law of honour to face fearlessly every problem that can fairly be presented to it. If a probable solution consistent with the ordinary course of nature can be found we must not invoke an abnormal act of creative power,” and in illustration he forthwith proceeded to express his conviction that from time immemorial many worlds of life besides our own have existed, and that “it is not an unscientific hypothesis that life originated on this earth through the moss-grown fragments from the ruins of another world.” In spite of the great progress made in science, it is curious to notice the occasional recrudescence of metaphysical dogma. For instance, there is a school which does not hesitate to revive ancient mystifications in order to show that matter and energy can be shattered by philosophical arguments, and have no objective reality. Science is at once more humble and more reverent. She confesses her ignorance of the ultimate nature of matter, of the ultimate nature of energy, and still more of the origin and ultimate synthesis of the two. She is content with her patient investigation of secondary causes, and glad to know that since Tyndall spoke in Belfast she has made great additions to the knowledge of general molecular mechanism, and especially of synthetic artifice in the domain of organic chemistry, though the more exhaustive acquaintance gained only forces us the more to acquiesce in acknowledging the inscrutable mystery of matter. Our conception of the power and potency of matter has grown in little more than a quarter of a century to much more imposing dimensions, and the outlook for the future assuredly suggests the increasing acceleration of our rate of progress. It is well that his memory should be held in perennial respect, especially in the land of his birth.

## THE TREATMENT OF SMOKE.

A LECTURE on the “Treatment of Smoke” was delivered by Mr. W. N. Shaw, M.A., Sc.D., F.R.S., before the Congress of the Sanitary Institute. After some preliminary remarks, Mr. Shaw said:—

If, then, we are not entitled to expect science to tell us how to remove fogs or smoke when it has been discharged into the atmosphere, what steps can we take? So far as I know the only suggestion put forward as practicable by those interested in the abatement of the smoke nuisance is to invite householders, and compel factory owners, not to make smoke, or to consume it if they make it, or in the third event, to make a little as may be consistently with their own interests. As regards factories, very considerable improvement has followed these efforts, and I do not wish to be adversely critical where I point out, first, that the distinction drawn between the factory and the domestic establishment is unscientific, and secondly, that that was not the plan adopted in the parallel case of the removal of sewage. Am I not right in saying that the advance in sanitation in that particular has arisen from the fact that the local authorities have used common funds to provide facilities for the removal of such refuse by main drains or otherwise and have then compelled householders and others to make use of the facilities provided?

### Further Development of the Analogy.

I would like to follow the analogy somewhat further, and subsequently call attention to the share which a local authority could fairly take in such an enterprise, supposing it were agreed that the proper course to be pursued is, not to prevent smoke by penal legislation, but to encourage the interception of smoke and the removal of the sooty particles before the air is allowed to escape. I do not wish to say that this is the only or the best mode of dealing with the question; I only want to consider whether it is, *prima facie*, practicable enough to justify our including inquiries with regard to it in the demands that sanitation may reasonably make upon science.

The suggestion may seem hopelessly extravagant, but you will allow me I will offer a few considerations in mitigation of your criticism of my venturesome proceeding.

First—there is nothing new under the sun—since I commenced putting my notes together I have learned that practically I am only recalling a suggestion made many years ago. A proposal for the treatment of smoke by the erection of municipal chimneys was made in Manchester by one who was prominent among the many Manchester men of business who have been distinguished by their scientific achievements, Mr. Peter Spence. I find very much encouragement in this, because it is precisely in such a city as Manchester—a city of fogs and smoke, but also the city of Dalton and of Joule—where the facilities for the association of scientific experiments with practical life have been so wonderfully developed around the hall, that an enterprise of this character could be taken in hand, and Manchester is in a better position for taking up the almost forgotten suggestion of their fellow citizen than any other of the abodes of smoke.

Secondly, the present method of dealing with smoke is by no means final, although, as I have said, it has marked a most important stage of progress. In many cases it achieves its primary purpose excellently, yet one of the most conspicuous features of London architecture is the enormous variety of smoke cowl, in all stages of dilapidation, to be seen surmounting the roofs. Almost every chimney-stack is a sort of museum of contrivances for improving the action of chimneys. I do not know what precise meaning to attach to the different state of dilapidation, but the mere exhibition of so many contrivances can only mean that smoky chimneys are not by any means rare as they might be under more favourable mechanical conditions. I should be glad if some one would be good enough to remark that the differences of height of roofs of the London houses make the treatment of smoky chimneys especially difficult, because that would enable me to put my second consideration the more forcibly by saying that on that account, if on no other, the separate chimney method of dealing with smoke is not suited to the circumstances of large towns.

Thirdly, I notice that when the designer of a factory erects his building he takes a further step in advance in the treatment of smoke, and provides a single smoke stack for a considerable number of independent fires. The existence of this practice makes me regard the separate opening of each chimney of the domestic house into free air as not absolutely required by any physical laws governing the removal of smoke. The factory builder is not always successful in using his chimney for preventing smoke, but he is successful in leading the foul air many flues into one channel which might afford an opportunity for depriving the smoke of its soot.

Moreover, arrangements for propelling air mechanically are becoming every day more extended. Some of them as employed in various systems of ventilation are quite as elaborate as that which would be required to deal with the smoke of an ordinary

use or block of houses. A public dining-room is hardly regarded as properly equipped in the present day unless it has fan for ventilation, generally for the removal of tobacco smoke after dinner. Laboratories and other buildings of a similar character are provided with special means, mechanical or thermo-mechanical, for removing noxious fumes. There is no efficient distinction to be drawn between coal smoke and other fumes of refuse that foul the air to make it necessary to use one system for the former and a different one for the others. It seems almost certain that if the domestic architect had sufficient encouragement to make the attempt, he would not find the plan of dealing with household smoke by the method of the factory chimney or by mechanical propulsion beyond the range of practical physics.

The plan of using a single combined orifice for the delivery of the smoke of a number of chimneys of a domestic building is actually been introduced in the case of a building that had originally, and still has its separate flues, unless I have been deceived by external appearances. Within sight of the windows of my office is a row of three houses, the roofs of which are each below the level of surrounding buildings. Most chimneys in such situations in London are separately provided with some sort of cowl, but in the case I speak of groups of four chimney-stacks at the angles of a square have been capped, and a single flue led from each stack to a central chamber surmounted by a large lobster-back cowl. From this central cowl the smoke of the four chimney-stacks is delivered to the outside. This example seems to me to be especially encouraging, because it shows that if it were desirable to drain away the smoky air of houses with a view to "treatment," it might not be considered necessary to entirely rebuild the houses.

#### *Some Particulars of the Smoke Problem.*

For purposes of comparison let us next consider what is the amount of smoke-laden air with which we have to deal. It is difficult to give any but the roughest estimate. I propose to reason with the weight of air and not exclusively with its volume, because in moving large quantities of air the weight is an important element in the calculation; at the same time the weight of air is frequently overlooked. Let me give some particulars. A cubic foot of air weighs about an ounce and a quarter, or 8 lb; the air in a room 15 feet square and 10 feet high weighs about the twelfth part of a ton. A room 70 feet long by 40 feet wide and 20 feet high holds two tons of air. It is when a continuous process of supply and removal of air under consideration large weights of air must be taken into account. I shall assume that on the average every house of about 600,000 rated for the municipal purposes of London has its fires burning, and therefore two chimneys emitting smoky air for twelve hours each day, and that each chimney uses and discharges 10,000 cubic feet of air per hour. If these estimates are inaccurate, we can at least ask scientific men to correct them. On these assumptions every "working chimney" discharges 4 1/2 tons of smoky air per day; every house, on the average, 8 1/2 tons. We thus obtain the estimate of five millions of tons of smoky air sent up the household chimneys of London in one day. Some allowance has also to be made for the 14,500 factories of London, which are not altogether innocent in the matter of smoke. I have no accurate idea what the allowance should be, but taking a factory chimney as equivalent to thirty house chimneys we should get an additional 2,000,000 tons of air fouled with smoke passing up the factory chimneys; that is in the aggregate about 7 1/2 million tons of air are used per day in London to carry away smoke, as compared with about a million tons of water to carry away sewage. The cost of dealing with the sewage is about 600% per day. I have, of course, no means of estimating what the cost of dealing with smoky air would be, but supposing that a ton of dirty air could be "treated" for the same cost as a ton of sewage, the cost of clearing the air of London must be set down at 4,200% a day, equivalent to a rate of 10d. in the pound.

I would mention incidentally that to move air is a comparatively cheap matter. An electrically-driven fan will do the work of a single chimney as regards smoky air at a cost of about a penny under suitable conditions. A single colliery fan has been made to deliver as much as 200,000 cubic feet of air per minute, and its output therefore amounts to about 20 tons a day, or sufficient to carry the smoke of more than 1,000 London houses on the scale mentioned above. Five hundred of such fans would carry the household smoke of the city of London. It would mean a huge aggregation of power, but London means the same.

A layer of air 60 feet thick over the 75,000 acres comprised in the administrative county of London would weigh about 7,000,000 tons. The calculation suggests that on a day of dense fog there is very little horizontal movement of air, there is a more or less complete circulation of the air through the chimneys and back to the streets and houses during the hours when chimneys are

These figures show that although the volume of smoky air is vastly larger than the volume of sewage, yet the cost of dealing with it for the purpose of treatment may not be of an altogether different order of magnitude from the cost of the manipulation of London sewage, and the point at which I wish to arrive is, that we are justified in asking practical men of science, as a first question, whether the treatment of smoky air, on a plan somewhat similar to the treatment of sewage, is mechanically possible, within reasonable limits of original outlay and current expense.

#### *Limitation of the Analogy.*

I have now, I think, traced the parallel upon which I set out, as far as it will safely lead, and beyond this point in the treatment of smoke it would be necessary to diverge from the plan adopted with sewage, both as regards the special method of dealing with smoke and as to the part which the local authorities should take in encouraging and assisting the purification of air.

I do not suppose that it is possible to establish a few main drains for smoky air corresponding to the main sewage drains, and to use one or two cleansing stations for purifying the air from smoke. I made a rough calculation and concluded that to deal in that way with the smoky air of London would require some forty tunnels of the size of the Underground Railway tunnels to carry away the air, but in the case of air it might be possible to achieve a similar result by a large number of systems on a correspondingly small scale, and the systems might be some of them municipal and some private. A single block of houses might have means for drawing off the smoke from all its fires into a chamber wherein the smoke could be treated before the fouled air was allowed to pass into the atmosphere, and if such a system were mechanically feasible we should then be able to put a second question to practical men of science, viz. whether it is not possible to completely deposit from the air as it passes on its way the solid particles which form the smoke. It has been shown that sooty particles coagulate under mechanical action, and some years ago Sir Oliver Lodge showed experiments on the deposition of smoke in a closed chamber by means of electricity. Since that time the means of production of electricity on an industrial scale have been greatly facilitated, but no further step has been taken, so far as I know, in the deposition of smoke particles. I should like now to ask whether it is not possible to make a further advance in the direction indicated by Sir Oliver of purifying air from smoke by that means. You will notice that I do not demand that no smoke shall be produced. I think that some people may prefer to pay the cost of abstracting the smoke if they are allowed the free use of open fires, to which in England we are so much attached.

#### *The Question of Cost.*

If the men of science give us satisfactory answers as to the physical possibilities, the question then becomes one of cost. Suppose that the cost amounts to the equivalent of a tenpenny rate. Would ratepayers be willing to expend a sum of that magnitude for the purpose of eliminating smoke from the atmosphere of London or Manchester?

In considering this aspect of the question it should be remembered that the result, if successful, would have some economies to set down per contra.

A bad fog in London, according to the *Times*, may cost 5,000% a day for additional gas alone; to that we have to add the loss due to interference with traffic and other incidental items. I have myself no means of estimating the whole cost of a day's fog. I have seen it estimated variously at from 20,000% to 50,000%, and the cost of fogs per annum is set, I think by Mr. Rollo Russell, at from three to five million pounds. If any of these estimates be true, the equivalent of a tenpenny rate would obviously be a very cheap, and to many people, even ratepayers, an agreeable substitute for the smoke of London. Certainly, whatever may be the material damage of a day's fog, the moral and intellectual damage should be reckoned as no inconsiderable addition, and if the indirect results of the dirt of London smoke could be avoided, even an additional tenpenny rate might be found acceptable to a majority of ratepayers.

It ought in fairness to be pointed out that the successful treatment of smoke would not do away with the effects of fog altogether. Under the most favourable circumstances as regards smoke there would still be fog, and probably more fog in London and other large towns than elsewhere, on account of the acid fumes among the products of combustion. The fog would be white, and white fog itself would cause serious interference with road, river, and railway traffic as it does with sea traffic now. But the large number of London fogs that are smoke and nothing else would disappear, and the avoidance of these and the abstraction of the smoke from the others would very largely diminish the losses attributable to fogs.

(To be concluded.)

## NOTES AND COMMENTS.

ALTHOUGH the Germans appear to be as eager to succeed in commerce as in arms, they will not suffer the face of the country to be degraded by such colossal advertising boards as are set up in England with impunity. An Act was passed in the last session of the Prussian Landtag which announces that, "With the object of preventing the disfigurement of places remarkable for their natural beauty, the police authorities are empowered to prohibit outside of towns (*ausserhalb der geschlossenen Ortschaften*) such advertising boards or notices or pictorial devices as disfigure the landscape by means of police regulations issued in accordance with the law of July 30, 1883. Such regulations may apply to particular areas or spots." A similar law was enforced in towns, but it was desired to protect landscapes also. The objection to advertisements was not altogether sentimental, although Germans enjoy their landscapes more sincerely than many other peoples. But it was apprehended that the tourist traffic might be diminished, and a pecuniary loss follow, if the country were allowed to be disfigured. The machinery of the Act is easily put in motion, for all that has to be done is to apply powers which the Legislature believe exist in an Act of 1883.

SIR JAMES CRICHTON BROWNE, M.D., in his address before the Sanitary Institute on the dust problem, gave an account of the experiments of Dr. MACFADYEN and Mr. JOSEPH LUNT to ascertain the number of particles of dust in a given sample of air. Experimenting in the yard of a London house they found that the average number of dust particles present was 300,000 per cubic centimetre, with an occasional rise to 500,000. Transferring the instrument to the roof of the house, a count became impossible, for millions of particles entered the chamber, illustrating the copious pollution of the air produced by chimney smoke. In a room of the house a number of successive counts were made, which ranged from 216,000 to 490,000 per cubic centimetre, but the slightest air current, or even a movement by anyone in the room, produced a temporary rise in the number of particles. When gas is being burnt or when smoking is going on in a room the dust particles increase from thousands to millions. A count was made before and immediately after lighting cigarettes. The number of particles at once rose from 360,000 to an estimated amount of millions in the cubic centimetre. Ten litres of open air in the centre of London, two specimens of which were tested, gave respectively 568,000 and 318,000 dust particles per cubic centimetre, contained eighty-three organisms, of which twenty-eight were moulds and fifty-five bacteria, and taking the lowest result obtained, viz. 318,000 dust particles in the cubic centimetre, it is seen that there was just one organism to every 38,300,000 dust particles present in the air. Ten litres of the air of a room which as the mean of twenty counts gave 350,000 dust particles in a cubic centimetre, contained nineteen organisms, twelve moulds and seven bacteria. In other words, amongst 184,000,000 dust particles only one organism could be detected. The scarcity of bacteria is remarkable, for experiment has demonstrated that from 1 to 22 micro-organisms per litre of air are habitually present in four-roomed houses in excess of those present in the outside air, and that in small tenements of one or two rooms the excess is from 6 to 240 per litre.

## ILLUSTRATIONS.

THE HEADLAND HOTEL, NEWQUAY, CORNWALL.

THIS hotel was erected from the designs of Mr. SILVANUS TREVAIL, F.R.I.B.A., of Truro and Palace Chambers, Westminster, president of the Society of Architects. It is the largest hotel in Cornwall, and is specially intended for the accommodation of the large tourist and holiday traffic which finds its way into this popular Cornish resort. It is particularly ample in the large area set aside for its general reception-rooms. The main lounge hall is over 90 feet in length, and has two spacious annexes opening out of it on either side. Large dining-rooms, drawing, billiard and smoking-rooms absorb

nearly all the remainder of the ground floor; and this from the social advantages that it affords makes the hotel one of the most popular in the West of England.

Above this are three floors of well-appointed bedrooms and sitting-rooms, approached by a very spacious grand staircase, which is fireproof, and also by electric lifts. Electrical energy is generated in the grounds, and is used for lighting and various purposes connected with hotel life, inclusive of the brushing machinery in the hairdresser's saloon.

Placed on a unique site over 5 acres in extent, which forms the neck of land connecting the headland with the mainland, the hotel enjoys the distinction of having an unobstructed sea view from every window. This also gives its guests immediate access to the charming promenade over the headland, which is a natural promontory many acres in extent which juts out into the Atlantic far beyond any other land in the vicinity, from which sea effects and sunsets are special attractions.

The materials used in the construction are local stone with terra-cotta facings. The roofs are of Cornish slate and the joinery throughout is of oak wainscot. The total cost, inclusive of site, engineering, furniture and general equipment, was upwards of 50,000.

The contractor for the building was Mr. ARTHUR CARKEEK, C.C., of Redruth; for the terra-cotta, Mr. HENRY DENNIS, of Ruabon; for the electrical work, Mr. F. H. HEADLEY, of St. Austell; and for most of the furnishing, Messrs. JAMES SHOOLBRED & Co., London.

## A MYTHOLOGICAL SCENE.

IT is remarkable that although JOHN BAPTISTE CIPRIANI was a Florentine he should have received his first instructions in art from HECKFORD, an English painter who had settled in that city. Afterwards while studying in Rome he met Sir WILLIAM CHAMBERS and JOSEPH WILTON the sculptor, and they persuaded him to accompany them to England. BARTOLOZZI, who was also a Florentine, was then in power in London as an engraver, and by his engravings he made CIPRIANI popular. When the Royal Academy was founded CIPRIANI became one of the original members. His paintings on a large scale wanted power. He was more successful in small allegorical designs like those for the royal state carriage and in his drawings, which show exquisite taste. He had Classic precedents for children endeavouring to frighten each other with a gorgon's head. It was allowable for him to utilize the sphinx as it was half a century afterwards by HEINE, who described the being as half brutish and half human—a lioness in trunk and claws, in head and breasts a woman. The winged Pegasus also seems to join in the revels, and we suppose the bird introduced to fill a vacant corner is to be taken as JOVE's eagle. CIPRIANI suggests his strength and his weakness in the design. His boys are equal to ALBANO's or STOTHARD's, but his imaginative beings are failures. The artist's industry was extraordinary, for after his death no less than eleven hundred designs which remained with him were sold at auction. He was the designer of the diploma for Royal Academicians and was presented with a silver cup by his fellow members in return. We may add that the companion print representing the Arts has already been published in *The Architect*.

LYOYD'S BUILDING, FENCHURCH STREET, E.C. CLASSIFICATION ROOM.

APOLLO THEATRE, SHAFTESBURY AVENUE, W.

THE chapel at Swanley Junction, of which an illustration was published in last week's issue, is now in course of erection (the two aisles being left for some future date). The building is being constructed of red brick with Bath stone dressings. The architect is Mr. ALBERT C. FREEMAN, of Clapham. The first contract, which includes the seating, is 1,890*l.*, and is being carried out by Messrs. GODDARD & SONS, of Farnham, and the heating let to Messrs. CHAS. P. KINNELL & Co.

## THE SANITARY INSTITUTE.

THE congress of the Sanitary Institute opened at Manchester on Tuesday, when the inaugural address was delivered by the Right Hon. Earl Egerton of Tatton. His lordship said:—

My first duty is to welcome to Manchester the members of the Sanitary Congress. We have had here recently a meeting to discuss the art of healing disease; we now have to bring before you the not less important art of prevention of disease. It is a truism that the foundation of health is pure air, pure water, pure food and well-arranged dwellings, and that the sound mind in the sound body is the aim of our Institute. Unfortunately, how seldom are all these conditions fulfilled? We have at last begun to recognise that we live an artificial life, and, though we cannot revert to the tent life of the nomads, that many if not all diseases are benefited by the patients being in the open air as much as possible. Our earliest laws on sanitary matters were given to the Jews by Moses to a nation who lived in tents or tabernacles, and modern inquiry has ascertained that the vitality and longevity of the Jews is beyond that of any other nation among whom they have lived, on whatever cause that may arise. "Our position as a nation depends on our national health, and on the endurance and progressive force of our national vitality," says Dr. Richardson, and does not our commercial position, threatened as it is by the vigorous races of North America, and by the trained intellects of Germany, depend on our being roused to greater vigour and adapting ourselves more readily to the change of circumstances produced by the introduction of new races, new motive powers and greater facilities of locomotion?

I regret that I have neither the qualification nor training of an engineer or a physician to give weight to any remarks I may make on sanitary questions, and am unable to follow in the steps of my distinguished scientific predecessors who have taken the chair at previous congresses. I can only speak as a resident in a populous district, and as one responsible for dealing with the dwellings of the poor, and the buildings on my estate connected with our farms, and as one who has taken a humble part in the various legislative measures which have been passed to improve the sanitary condition of our towns and the health of the people during the last forty years.

I can certify to the great sanitary improvements which have been made in the cottages, farms and farm buildings in my collection, and in the water-supply of our country districts, that we have been hardly sufficiently alive to the storage of our rain-water; the sanitary authorities still keep a watchful eye on the necessary supply of fresh air to our agricultural buildings, the cubical contents of our cow-houses and the supply of pure milk.

The water-supply in Manchester, though drawn from two mountain districts, was very inadequate during the exceptional drought of last summer, and the construction of the additional pipes from Thirlmere, which is now in progress and should not be long delayed, will give an ample supply to Manchester and the neighbouring districts.

It seems in vain to dwell on the question of pure air when we see the canopy of smoke daily drifting over the green fields of Cheshire, and sulphuretted hydrogen and chlorine gases affecting the vegetation for many miles round Widnes and Northwich. I served on the Royal Commission on Noxious Gases about twenty-five years ago, and I regret that their recommendations that manufacturers should use the best practicable means for preventing the discharge of all noxious gases into the air have not entirely remedied the injuries done to vegetation. I am afraid, till a new motive power which is not dependent on coal is more generally introduced, we cannot expect to see much improvement. The present law, even when carried out strictly, is inadequate for the purpose of controlling the ordinary consumption of coal required in works and its effects on our atmosphere. The larger use of gas, petroleum and electricity may create such an improvement in this respect as we cannot at present foresee.

I will rather mention in some detail what has been done to improve the purity of our rivers, and specially of those which supply the Ship Canal. The first step to prevent the pollution of the rivers Mersey and Irwell and their tributaries was taken at a conference convened and presided over by myself as chairman of the Canal in January 1888, at which sixteen corporations, forty-eight local boards and ten rural sanitary authorities were represented.

The Rivers Pollution Prevention Act was practically a dead letter, as it was difficult for an authority to bring proof of pollution against polluters outside the area of jurisdiction, and such authority was unwilling to purify its own effluent whilst others on the stream took no steps.

On August 23, 1889, a conference of sanitary authorities was held in the town hall, Manchester, at which I presided, when certain resolutions were passed which were forwarded to the county councils of Lancashire and Cheshire. Both these bodies decided to apply to the Local Government Board under the 14th section of the Local Government Act of 1888. In

December 1890, a local inquiry was held by the officials of the Local Government Board, and the outcome of this inquiry was a provisional order by the Local Government Board in 1891 constituting the joint committee of the rivers Mersey and Irwell.

This led to an application to Parliament for further powers, and since 1893 considerable progress has been made, and manufacturers have generally recognised the necessity for preventing the trade waste being thrown into the rivers and the justice of being required to do so; and the response to the joint committee's request has been without exception loyally carried out, and without the intervention of severer measures.

Solid matter from the works is to a great extent kept out of the rivers, but serious pollution is caused by soluble putrescible organic matters, or partially treated sewage. Much delay has arisen in the adoption by the sanitary authorities of various methods for the removal of such organic matters. Manchester and Salford are now making fair progress.

I am enabled to state what has been done in Manchester from the information furnished me by the Chairman of the rivers committee of the Corporation of Manchester, and by Mr. R. A. Tatton, the chief inspector of the Mersey and Irwell joint committee.

Manchester has constructed a network of sewers, the total length of which amounts to 1,700 miles. These sewers vary from 9 inches in diameter to the main sewer of 14 feet 10½ inches. The total cost for this sewage system serving all the population of over half a million has been upwards of 600,000*l*. These sewers convey daily twenty-six million gallons down to the purification works at Davyhulme. This quantity is enormously increased at times by the storm waters. At present the purification of this sewage is partly but incompletely performed in settling tanks by the help of lime and copperas, the clear effluent being sent into the Ship Canal, and the sludge being sent away to the sea beyond the Mersey bar. To accomplish this result a capital expenditure of over 200,000*l*. has been incurred. In addition a large scheme, founded on the investigations and recommendations of the best chemists and engineers, provides for a series of detritus tanks and septic tanks, in which the insoluble mineral matter in the sewage will be arrested, and as much as possible of the organic sludge digested by anaerobic organisms. In this way the present large expenditure in chemicals will be unnecessary, and the cost of sludge removal greatly reduced. The effluent from these tanks will then pass on to 46 acres of primary aerobic bacteria beds. From these it will be further purified by passing on to 46 acres of secondary beds at Flixton, and finally, if necessary, 100 acres of land are provided to complete the purification. In addition to the 46 acres of bacteria beds at Davyhulme there are also 26 acres of storm filters to be laid down there, which are intended to purify the occasional excessive flow in time of storm, and to serve also as a stand-by for the main bacteria beds. Thus the total capacity of the new works will be to deal with 126 million gallons per twenty-four hours.

The scheme of these beds has been laid out as far as possible on broad and simple lines, so as to promote ease and facility of working. The beds are, with few exceptions, of uniform shape and dimensions and the point of admission of sewage to each bed is in the centre of the longer side adjoining the supply channel, which serves as a rule an equal range of beds on either side, so that in general the distributing centres fall in pairs opposite each other. Supply channels are of adequate width and gradient to permit of delivering the volume of sewage necessary for filling two beds at once on the same channel in the minimum required time by gravitation to each distributing centre in the scheme. The sewage is admitted from the supply channel to a distributing reservoir, from which it flows over a cill or weir of circular form, and thence along channels cut in radiating form over the surface of the bacteria bed. These channels are lined with fine grade material, which tends to arrest suspended matters on its surface, and retain them from entering into the body of the bed. The under-drainage of each bed is also laid out in radial form, the drainage lines converging into a main collecting drain, which is concentric with the distributing weir, and which communicates at each end with manholes, or at the centre with an outlet well, from which the discharges enter the draw-off channel. The under drains are channels formed in the concrete bottom of the bed, covered with stoneware perforated slabs, set in rebates, so as to be flush with the surface of the bottom.

The average depth of the clinkers forming the body of the bacteria beds is 3 feet 4 inches, each bed having a cross fall of 2½ inches, and the space between the radial drainage lines being formed with a ridge in the centre to facilitate the discharge of the final drainage at the bottom. The body of the bacteria beds is composed of furnace clinkers from which the fine material has been removed by screening, and the coarsest material is used for covering more particularly the radial drainage lines and also the concrete bottom as far as practicable. About 12 acres of beds are now in operation, and the

following method of procedure is recommended for the successful working of contact beds:—

1. The bed should be worked very slowly at first in order to allow it to settle down and the bacterial growths to form. In this way there will be less danger of suspended matter finding its way into the body of the bed, while the material is still loose and open.

2. The burden should not be increased till analysis reveals the presence of surplus oxygen, either dissolved or in the form of nitrates in the effluent.

3. Analyses of the air in the bed may usefully be made from time to time during resting periods.

4. The variations in capacity should be carefully recorded. If the capacity is found to be rapidly decreasing a period of rest should be allowed.

5. Long periods of rest should be avoided during winter, as when deprived of the heat of the sewage the activity of the organisms decreases. If necessary the burden on the bed should then be decreased by reducing the number of fillings per day, rather than by giving a long rest at one time.

6. The insoluble suspended matter should be retained on the surface by covering, at any rate, a portion of the latter with a layer of finer material not more than 3 inches in depth. The suspended matter thus arrested should not be raked into the bed, but when its amount becomes excessive it should be scraped off. This should be done if possible in dry, warm weather, after the bed has rested some days. By placing the inlet and outlet penstocks (or sluices) as close together as possible the suspended matter will tend to concentrate in their vicinity, and its removal will be facilitated.

The total capital expenditure on sewers and purifying works in Manchester and neighbourhood will amount to 1,300,000*l.*, or rather less than 2*l.* 10*s.* per head of the population served.

With regard to the other local authorities in the Mersey and Irwell watershed, alumino ferric is used by nearly half the boroughs and district councils as a precipitant; nearly one-third use no precipitant at all. The sludge is mostly disposed of on the land, being either given or occasionally sold to the farmers as manure. Rochdale, Bury and Withington are also constructing new works on bacteria beds.

I desire to call special attention to the successful working of the joint committee in Lancashire and Cheshire, and to press upon the Government that similar legislation to that which is now confined to those counties and Yorkshire should be extended to the whole country and made compulsory. The manufacturers in these counties feel that all similar traders in the kingdom should be compelled to treat their trade waste in the same way, as the cost of treatment is a definite charge on the cost of production and should therefore be general.

The outlay by the manufacturers has been considerable, probably not less than 300,000*l.*, but the improvement of the river water is itself an important benefit to them when river water is used for manufacturing purposes.

The Royal Commission on Sewage is of opinion "that the general protection of our rivers is a matter of such grave concern as to demand the creation of a separate commission or a new department of the Local Government Board, which shall be a supreme rivers authority dealing with matters relating to rivers and their purification, and which, when appeal is made to them, shall have power to take action in cases where the local authorities have failed to do so."

We have in this great city triumphs of engineering and mechanical art applied to various industries, but the population which inhabits it has, as in other large towns, degenerated in size and physical power from the ancestor or progenitor who was attracted into the town by higher wages from the country districts. The same process is still going on, the large percentage of rejections from physical disabilities among those who offer themselves as recruits, even in Manchester itself, gives an alarming proof of the degeneracy of the town population. One of our great problems is to arrest this deterioration and to make up for the necessary drawbacks of town life by greater care in the physical education of the young, and in teaching them the principles of hygiene or the preservation of health. Though it is given to many of no great physical strength to succeed in the race of life, and by sheer brain power to triumph over physical weakness, yet in most cases a strong physical frame is necessary to supplement the endowment of the mind in most of the careers open to man. There are many other questions bearing upon the national health which will be profitably discussed during the present Congress. I have only attempted to deal, however inadequately, with a small portion of the large field open to me, and only with those subjects with which I have been personally brought into contact. I will only mention one further point which I think bears on the sanitary condition of the country. We are suffering from overcrowding in our towns, partly from the want of employment in our agricultural districts owing to the increased surface of land laid down to grass, and to the growing of corn being no longer as profitable as it used to be. It would be a great relief to that class if greater emigration were

to take place to our Colonies, where they would furnish with good customers for our goods and send us further supplies of the raw material for the food that we require. Canada and our other Colonies are being brought closer to us by the devotion they have shown to the mother country in the late war, and there is in the North-west of Canada a country which, when fully opened out by new settlers, would supply us with all the wheat we require.

South Africa is also an attractive field for all classes, both men and women, and there under a fine climate, and with the soil improved by systematic irrigation and opened out by railways, there is an opening for our farming class and for skilled artisans in all trades in the towns. In that country many of the delicate classes of our children, especially those with a tendency to consumption, would recover health if they were sent out by our Guardians, or emigrated with their parents at an early age. They would soon be able to earn their own livelihood in the purer air of the African highlands instead of being a burden and considerable expense to the country in our hospitals at home. I trust that this is not merely an imaginary picture, but one which might be carried out to the great advantage of our country and to many of those who are not strong enough to face the severe competition in our labour market at home.

There may be considerable ignorance in this country on sanitary questions, which it is the desire of the Congress to remove and enlighten, but at least we are far in advance in sanitary matters of other European nations, as far as my experience goes, and any improvements in sanitary matters in the hotels abroad have been borrowed from England to meet the requirements of English visitors.

In conclusion, I should like to express a hope that our deliberations may pave the way by improved sanitary conditions to the greater vigour and regeneration of our fellow countrymen, that we may not fall behind any of our competitors in either Europe or America by any decay in our race and as our soldiers have not shown themselves inferior in pluck or endurance in our recent war to any of their ancestors who have carried the English flag round the world, so our artisan may still hold their supremacy, both in skill and in physical strength, by a recognition of those sanitary laws which it is folly to ignore or disregard, and which it is the object of this Congress to make known.

## WEIMAR.

IT is notable how Thuringen flattens and grows dull as you approach its capital. If you are coming from Eisenach says the *Scotsman*, you will find nothing in the country around Weimar to compete with recent memories of the Wartburg, and, if you have travelled up through Jena out of the heart of the Thuringian Forest, you will find that the trees have receded and the hills smoothed themselves out before half-way is reached. The villages seem to lie less picturesquely; there are no memories of battles; the land is striped monotonously with grain and grass. And when you arrive and pass through the station square, past the bright line of 'buses into the newer streets, this disappointing impression is at first hardly lightened. There are no spires in the distance with a promise of better things. The few churches you pass have the clipped, Protestant look, so familiar in the reformed parts of Germany. The houses are not even strikingly ugly, and there are no extravagances of the new art of the country to amuse the traveller. The respectability of modern Weimar has resisted all attempts at comic relief. Only a certain slow dignity in the minor officials one meets at every turn, and a note of wilful elegance about the shop-fronts proclaim that you are in the capital of a country with a sovereign and a court of its own.

But when the dreary museum buildings and the usual hideous memorials of the patriotism of 1870 are left behind, the older and more sympathetic Weimar begins to uphold itself. Long, calm, white house-fronts line the pavements. The walls are decorated with touches of graceful eighteenth-century stucco in festoons and medallions, and the carved double doors are bright with well-polished old brass mountings. The attractions of the town seem to lie all in the past. It has not, like Jena, made for itself a bustling and a brilliant present. There is no university to keep it before the eyes of the intellectual world, and it is no longer the centre of movements and traditions. Even if it were to produce a new race of poets, or another statesman of genius, their name and fame would necessarily be transferred to other places, and even the advantage of being a capital city has very greatly diminished since the establishment of the Empire. It remains a blameless town, as towns go; is valued as an excellent place for boarding schools, and presents all the outward signs of progress. You may buy the latest Coronation portraits of their Britannic Majesties at any stationer's, and eat a passably cooked dinner in a perfectly modern restaurant whose frescoed walls are one

list of poppies, and whose very spittoons reflect the latest art fashions from Munich.

But somehow there is no great temptation to linger among these splendours, and one even forgets them as one turns to reminiscences of the past. The memories of Weimar are in a manner more individually distinct, more definitely linked into the chain of historical causes and events than those of Jena. There is a glitter of high politics about all the gay literary life of Weimar at its best. One remembers Goethe as the Minister of State, and does not forget that Sachsen-Weimar afforded the very first example of a German constitution. And whatever may be the transcendent glory of Goethe and Schiller, the Dioscuri of Germany in her troubled days, they always group themselves in any true perspective of history as the subjects of the great statesman and ruler, the Grandduke Carl August. This potentate appears to have been a man of many reputations. But as one looks at his genial portraits, the impression is rather that of the lettered and jovial sovereign, the companion of poets, the distinguished amateur, than of the wise diplomatist, who not only saved his Duchy from the consequences of the catastrophe of 1806, but by his liberal ruling and generous political ideals created the nucleus of the patriotism which was strong enough, a little later, to overthrow Napoleon himself.

It was the presence of his Court which made Weimar from a dull provincial capital into one of the most brilliant towns in Germany, and which filled it with the memories which make it worth while to this day to wander through its streets in search of fragments of the past. The relics of the State kept in those brilliant fifty-three years are concentrated in a little group of palaces which stand within hearing of the clamour of the market-place, and among the first trees of the grand ducal park. A little apart is the palace of to-day, the usual quadrangular structure, with high gilt-topped railings and sentinels in spiked helmets in front. It was built for Carl August under the superintendence of Goethe, and is otherwise uninteresting. But near by is a smaller, less pretentious building, without gates or courtyard. It is the French palace of old times, and since Goethe's day the grand ducal library. Here you may see in all manner of museum treasures, a sixteenth-century automaton made for a little prince of Weimar, who afterwards devoted all his leisure to turning ivory and carving cherry-stones; a model warship built in Holland by Peter the Great; Wallenstein's gala uniform and high boots; Goethe's own ministerial evening coat and the blue silk Japanese dressing-gown, clad in which he is said to have given readings of "Werther" to a circle of young lady admirers. The whole place is full of association with the prime of Weimar and the best days of Goethe's life. Under his direction the palace was transformed into a library and museum, the lighting was arranged so as to display pictures and sculptures to the best advantage; and the perfect arrangement of the collections, undisturbed almost as he left it, bears witness to his exquisite sensibility in the ordering of even the smallest details. And there are more tangible souvenirs. In the large library hall on the first floor, between the white and gold pillars, there was given a memorable performance of his "Iphigenie." The Grand Duke himself played Orestes, and all the other performers were members of the Court circle. Goethe acted as stage manager and audience. In this very room, too, is the "sacred floor," as the custodian puts it (and somehow it doesn't sound absurd) where Goethe stood one September night contemplating the exhumed bones of Schiller, which lay there awaiting transference to the vault of the princes of the house of Weimar.

The world has made inroads on the French palace since the days of Carl August. Time was when it lay quite in the seclusion of trees, and the surrounding part was "a paradise open only to princes and to poets," and now a broad new avenue has been cut right through, and the traffic rattles by on its way to the railway station. But you may still go to the window of Goethe's workroom in the upper storey, and look across to the house where Frau von Stein used to live, and where so much poetry was inspired. You reach a new, more vivid understanding of the life that was lived in those days, and details group themselves and build up a picture. Of Goethe's passage there are innumerable traces. It is remembered how he used to make ministerial journeys through the duchy, and how he would keep a sheet of MSS. underneath his official papers and add a verse or two to "Iphigenie" between the entries of rent and taxes. And even bills are still preserved wherein it appears that his Government frequently disallowed superfluous groschen, as beyond the modest state in which a Minister was expected to travel. You come on all manner of memories of the love affairs, pictures, verses, locketts, poetry-books, of the platonic passages, half-stately, half-tender, finissant par la main baisée, which passed in that age which had not forgotten the eighteenth century in its eager welcome of the nineteenth.

The historic sights of Weimar are scattered things. You may do what your guide-book tells you, and walk through the prescribed streets. You will find the park pretty and the older

town mildly quaint. But only here and there, as when you come upon Goethe's garden house, or reach Schloss Belvedere, the scene of so many grand ducal festivities in the great days, do you experience that quickened thrill of interest to gain which it is worth while to spend hours of blinding heat in a German third-class railway carriage. Still Weimar to this day makes a gallant struggle against the commonplace; and those who interest themselves in music or philosophy will turn reverently towards the town which contains the villa of Franz Liszt, and which a year or two ago witnessed the infinite tragedy of the last days of Friederich Nietzsche. The theatre, too, is there, to remind you of the most brilliant dramatic past in Germany. The laurel crowns bestowed on the first nights of "Faust" and "Wallenstein" are still to be seen in the museum; and here, in 1850, Liszt directed the first performance of "Lohengrin."

But the crown of all the attractions of Weimar, the memory of memories, is of course preserved in the two houses where Schiller and Goethe lived and died. Schiller's house is a modest building in the style of the century before last, retreating a little from the line of its more modern neighbours. It cost 300*l.* when it was new, and Schiller lived there the last five years of his life. You may see the apartments where Schiller wrote and received his company, a few relics, and lastly, the room in which he died. All is in the highest degree austere and dignified. The simplicity of these bare rooms has a real pathos of its own, and the well-read, impressionable tourist has sometimes been moved to the verge of tears at the thought of the struggles and the cares reflected there. But it is perhaps with a truer insight that others see in Schiller's house the habitation of a philosophically given and impersonal genius, one who never depended much on his immediate environment, and for whom it was impossible to spend hours caressing bibelots or lingering over title-pages. And in recognising this air of pure intellectual distinction which still hovers about Schiller's surviving possessions, one finds at last both the true meaning of his greatness and the reason why he is often unsympathetic to English readers.

Goethe's house makes a different impression. It looks important, even splendid. The street widens out respectfully before it, and it appears to fill the whole of one side of a square of less distinguished buildings. The long rows of windows suggest stately rooms lying behind. The dignified front door with its flight of steps seems still expectant of grand ducal carriages, and the whole house suggests the statesman, the minister, the intimate of sovereigns.

But, as you enter, this impression disappears in a keen and vivid realisation of Goethe himself. Any idea of a purely official prominence is happily eclipsed, and when you have passed the few pieces of sculpture on the plain unadorned staircase you reach no interior of cold stateliness. The rooms are smaller than one expected; any shooting lodge in Scotland possesses a larger dining-room than Goethe had. But they are full of the traces of his presence, and of his friendships and of his pursuits. The pictures, family portraits, friends, the reigning family, the great men of his day, hang just as he had them. The furniture, in the simple German rendering of the first Empire style, is just as he left it. The very decorations were chosen by him. A wise and pious management has decreed that, so far as possible, all shall remain as it used to be, and several of the rooms look as if they awaited his return from a journey.

His collections have been arranged more on the usual plan of a museum. There are royal gifts, laurel crowns of gold presented by admiring towns and communities, drawings by himself, silhouettes, the collections he made in Italy, precious and curious souvenirs; and among all the testimonies of admirers there is one which above the others is interesting to the travelling English. It is a long dark lock of hair, secured to a sheet of that old-fashioned embossed paper on which valentines used to be written. And on the paper is inscribed a quotation in a fine Italian hand dedicating the tress to Goethe, dated from Craigenputtock and signed Jane W. B. Carlyle. It is not the highest form of hero worship which lingers over the material surroundings of dead genius. But in the case of such a man as Goethe, who impresses the imagination with every one of the visible signs of greatness, the sight of the objects with which he was daily familiar is irresistibly affecting. And so the culmination of the visit to his house is naturally the room in which he wrote and thought in his last days. His desk, his chair, the books to which he would refer, the table at which he sat and dictated to Eckermann in the last year of all; and across the room the glimpse of the small bedroom, the bed, one elbow chair and the light of a little window, make an impression which can never be forgotten. The custodian arouses you with a tag. "Alles ist vergänglich," he says; and if you are a wise sightseer, you will refuse the invitation to view Frau von Goethe's roomy wardrobes in the garret above. You will leave the house and leave Weimar with the consciousness that now they have indeed nothing more to show.

## ASYLUM BUILDING IN ENGLAND AND SCOTLAND.

BY desire of the Edinburgh District Lunacy Board, Mr. George T. Hine has examined the plans prepared by Mr. H. J. Blanc for the new Bangour Asylum, in order to ascertain whether the cost could be reduced, &c. The following report to the clerk has been prepared on the subject:—

Referring to your Board's remit and our correspondence on the subject, I have at length completed my investigations and examination of the drawings and specifications of this building, submitted by Mr. Blanc, and have also carefully perused the various reports of your special committee and others relating to the matter, and am in a position to now formally reply to your letter of May 19 last. I have also, as you are aware, visited the site at Bangour in company with the chairman of your Board, Sir John Sibbald, your architect, and yourself, and have since spent much time in examining examples of different forms of building construction and obtaining particulars and prices of various classes of work in Scotland, and now beg leave to report to your Board as follows:—I should first explain that I understand from your reply to my inquiry of June 10 that the fourth instruction of your Board in their remit, viz.:—"and generally to advise the Board in the matter"—is not intended to invite my criticisms on the general scheme or principle of design, which, together with the site, have been determined and approved by your Board; I have, therefore, limited my inquiry to matters of construction as affecting the cost of the buildings which have been determined and approved by your Board. I desire to express my admiration of Mr. Blanc's designs generally, which, in my opinion, show evidence of the greatest consideration and most patient labour on the part of the architect and your Board's advisers. Whatever success may attend the working of an asylum in this country designed wholly on the villa system, I can say with confidence that the present drawings, if carried out in their integrity, could not fail to produce a building which would be an ornament to your country and a landmark in the history of asylum planning; and if, in furthering your endeavours to effect economies, I am called upon to recommend alterations which may have the result of marring the beauty of Mr. Blanc's designs, I shall do so with the greatest regret, particularly as I know that he must have spent an enormous amount of time and trouble in bringing them to their present state of completion. I desire also to say that I have very carefully studied the report of your special committee, and am in full sympathy with their endeavours to effect economies, and fully appreciate the very great amount of labour they have bestowed in arriving at the conclusions set forth in their report. The question of the cost of our asylums has of late years exercised the minds of many local authorities responsible for the erection of these buildings, as well as those members of H.M. Government who have the chief control of asylum matters and the expenditure of public money. I have been frequently called in to advise how this expenditure could be curtailed without prejudice to the proper treatment of lunatic patients, and am, therefore, in a position to thoroughly appreciate the efforts of your special committee, and hope to be able to advise you with a satisfactory result.

To your Board's first inquiry, "Whether the plans can be modified or remodelled so as to reduce the total cost to a sum representing 300*l.* per bed or less?" I would reply in the affirmative, subject to the following observations:—(1) I understand that the cost per bed referred to is intended to include only the cost of building works and engineering fittings, roads, drainage and sewage tanks, architect's and surveyor's commissions and furnishing; but excluding laying-out and planting the grounds, water supply, railway works and, of course, the cost of land and attendant expenses. (2) I also understand that in putting the cost at 300*l.* per bed, you refer to the completed asylum of 1,000 patients, and not to the buildings proposed to be erected in the first instance, which comprise an administrative department, including kitchen and stores, together with recreation hall, chapel, workshops, laundry and officers' residences, sufficient for an asylum for 1,000 patients, but with homes or wards sufficient only for 600 patients. Generally speaking, when considering the cost of an asylum it is broadly estimated that the patients' blocks account for half the total cost of the asylum, the other half being absorbed by the administrative and other buildings; and, therefore, in arriving at the cost per bed of the buildings erected in the first instance, comprising patients' quarters for 600 and administrative buildings for 1,000, you ought to divide the total cost by 800 (the mean between 600 and 1,000) to arrive at a fair estimate of the cost per bed. In replying, therefore, to your first question, I say it would be reasonable to limit the cost to 300*l.* per bed for the completed asylum of 1,000, or in forming an estimate of the cost per bed of the buildings erected in the first instance you must divide the total cost by 800. I should further point out that in speaking of the cost of the buildings of an asylum it is not usual to include furniture, which is a

matter of equipment not generally under the architect's control. In my own practice I make a rule of including in my estimates only such matters as I am responsible for, and if you observe this rule in the present case and deduct the 20*l.* per bed for furnishing, which is tacked on to the buildings estimate, it would reduce the price per bed in the present inquiry to 280*l.*—a most unreasonable limit to fix for all works under the architect's control. I will explain later on how I propose to reduce the cost of the buildings, but will first reply to your other questions.

2. "Whether the plans can be adapted to brick harled." In an architectural sense there is no difficulty in retaining the present designs so far as the plans are concerned, and adapting to them elevations suitable to brick harled work, but whether the same drawings can be utilised is another matter. Probably Mr. Blanc would find it simpler to redraw, at least, all the sections and elevations than to alter the existing ones. This, however, is a matter of detail which may be left to the architect.

3. "Whether by building with brick harled the cost will be reduced to any, and if so to what, extent?" This question has involved much consideration and also inquiry into the cost of various classes of work, followed by many measurements and calculations, with the result that I am now in a position to give you a fairly approximate estimate of the saving that might be effected by substituting brickwork harled for the present stone treatment of the outer walling, basing my estimate on the comparative value of the two classes of work when applied to the cubic contents of the buildings as already designed. I should also state that, for my own satisfaction, I have not accepted the figures supplied me by Mr. Blanc, but have remeasured the whole of the buildings myself, but without, however, finding any material difference. My estimate must, however, be accepted with some reserve, for the reason that the whole of Mr. Blanc's working drawings are not yet completed, and have had to refer to the competition drawings of several buildings, viz. the recreation hall, church, nurses' home, attendant cottages and the mortuary and pathological buildings, in order to complete my investigations.

You will understand that to give you anything approaching an exact estimate of the cost of your asylum in the two forms of construction would necessitate the preparation of numerous further drawings and schedules, which would prove a very lengthy and costly procedure, and which I assume you do not desire. I have, however, prepared a drawing of one of the blocks, viz. the home for thirty-two patients, taking Mr. Blanc's plan, and erecting from it elevations illustrative of a brick harled treatment of the simplest form of design, with no stone dressings to windows or doorways, but showing the harled treatment on the in-goings of the window openings, this being the form of construction on which I have based my estimate of the saving to be effected by adopting what I shall call in future reference the "simplest form of brick-harled treatment." If you refer to this drawing you will see that the whole character of the building is changed. All stone dressings are entirely dispensed with, excepting the window-sills; the windows are of the ordinary type of double-hung sashes and frames, the roofs are covered with slates of an inexpensive character from Ballachulish or Easdale, and the walling of brick or whinstone rubble, harled as before described. I have made, moreover, one alteration in the plan, but only to illustrate what might be done in the way of reducing the size of these buildings to their narrowest limits, viz. I have provided for the nurses' rooms on the second floor of the one wing, instead of taking up the whole building to a uniform height with the nurses' rooms in the centre, leaving the remainder waste space as shown in Mr. Blanc's design. This alteration makes the building more compact, and reduces its cubic capacity by about 20,000 feet. It is, however, intended only as a suggestion of what might be done with some of the other buildings to assist in keeping down the cost; but I have not considered this in preparing my estimates, but have measured the buildings as at present planned. I should also state that I have considered it necessary, in order to keep down the cost to the figure given, to vary the internal treatment of the buildings, denuding them of all ornamental or unnecessarily expensive fittings, omitting wooden dadoes in the rooms and substituting a chair rail at dado height, with cement face to the wall below and a plain skirting. I have also assumed the substitution of granolithic or papyrolith flooring in the lavatories, w.c.s, passages and other rooms and lobbies for the more expensive paving specified in Mr. Blanc's design. The lavatory and other sanitary fittings must be of sound but plain construction, and the fittings and finishings generally of the character adopted in the most recently erected London County asylums. Without, however, burdening you with a technical description of all the details, I wish you to understand that in this "simplest form of brick harled treatment" everything is assumed to be of the plainest character consistent with sound and durable construction. Assuming that the whole of Mr. Blanc's buildings for the completed asylum of 1,000 patients were remodelled and constructed as thus described, I am of

union that the cost might be reduced to 292,000*l.*, or 292*l.* per bed, including furnishing at the rate of 20*l.* per bed.

Having thus answered your three questions in a categorical sense, I will proceed to deal with your fourth instruction, and advise you generally in the matter." In the first place, I think it right to remind you that asylum construction has of late years undergone a marked evolution, and, in the laudable desire to assist in the cure of lunacy, experts in asylum construction have not always restricted themselves to cost in erecting and fitting up buildings best adapted to the treatment of the insane, and in this respect Scotland has certainly not been behindhand compared with other countries. The result of these endeavours to produce the most suitable buildings has led to a somewhat lavish display of decorative treatment, as is evidenced in the three modern asylums of Gartloch, Hawkhead and Hartwood, compared with which buildings Mr. Blanc's designs are certainly moderate, and show no undue extravagance, and I should therefore say that, without any distinct instructions to work on different lines, he was perhaps justified in following the lead of these asylums to the extent he appears to have done. I should further remind you that in erecting asylums, which are in the nature of Government buildings, the simplest construction and greatest durability should be aimed at, and that you would be erring in the other direction if you allowed your buildings to be erected after the manner of second-class suburban villas.

While investigating the different forms of construction in the neighbourhood of Edinburgh, I found that where harling was done it was only in quite the lower class of property that brickwork was used as a basis of construction, and in the better class property stone, which is the natural building material of the country, was used as a foundation for the harling. Further, I find that the cost of plain rubble walling is generally less than brick walling of equal thickness, and no more than brick walling 18 inches thick, which in England is regarded as a standard thickness for buildings of this class. I should further point out that the greater cost of stone buildings does not lie much in the walling as in the freestone dressings to windows and doorways, together with the copings, cornices, string-courses and other decorative features; and therefore the greater saving which it is possible to effect in the outer construction of these buildings does not depend so much on the substitution of brick for stone, or of harling for rubble facing, as in the omission of the freestone dressings, which, as I am going to show you, can be practically done away with without sacrificing constructional soundness and, not necessarily, much architectural effect. I have ascertained that, by using a little extra care in selecting and trimming the facing stones and neatly pointing the joints, plain rubble walling, with larger stones selected and trimmed for the rybats, may be executed at a cost that will not materially exceed the cost of harling, and with a result immeasurably superior to mere harled work, giving a substantial and lasting appearance, and involving little or no cost in upkeep, as in the case of harled work, which requires recolouring from time to time and occasionally renewing or repairing. Having regard, therefore, to the character and appearance of your proposed buildings, and to their substantiality and durability, I should advise that the present character be adhered to, simply denuding them of all expensive dressed freestone work where possible, and treating the walling and window openings in the way I have described. This will allow the existing drawings to be used, with some few alterations, and the present schedules can possibly be retained, so far as the quantities are concerned, by altering the descriptions and cutting out the freestone work altogether, with such of the minor fittings as are of an expensive character, and which you may think it desirable to do away with. If this is carefully done, and the pruning knife used somewhat unsparingly, I am of opinion that the total cost might be reduced to show an average rate of 300*l.* a bed, possibly less excluding the furniture, and in this way there will be comparatively little loss of time, which I understand is an important consideration.

If it is a fact that you are very seriously pressed for accommodation for your patients, I think it would be wise to proceed at once with the erection of the infirmary and administrative block, the drawings of which are already completed, and, as I understand, the schedules also. This block will give you accommodation for 40 male and 40 female patients, together with quarters for a certain number of officers and staff, with offices, kitchen, &c., without which it would be impossible to work any building as an asylum. The alterations to the drawings and schedules of this one block, sufficient to bring them within the terms of my recommendation, ought to be easily effected in about a couple or three months, which would allow you to commence building operations before the end of the present year. By adopting this course you will have an opportunity of testing the effect of the alterations I have suggested, and will be able to form a fairly accurate estimate of the total cost of the asylum treated in the same way before you commit yourselves to the principle generally.

I gather that it is not within the limit of my instructions to

criticise the design of these buildings, but I think I shall be allowed to suggest alterations in the plans of any buildings for which working drawings are not yet prepared, such as the recreation hall, which, in my opinion, is unnecessarily large for an asylum for only 1,000 patients. The floor area as designed covers nearly 8,000 feet, whereas in none of the London asylums, which all accommodate 2,000 patients or more, has the recreation hall a floor space of more than 7,200 feet, and in many cases less. In one of my latest asylums, which is designed ultimately for 1,250 patients, the recreation hall has an area of a little over 5,000 feet, and in your case a room of similar size ought to be large enough for your prospective requirements. Further, I may say that for asylum purposes a church of less pretensions than appear in the design submitted by Mr. Blanc in the competition would answer every purpose, and the medical treatment of the patients would not suffer in consequence. Indeed, I should state that in framing my estimate I have calculated for a church of simple design as well as a recreation hall of more moderate dimensions.

I ought also to state that in preparing my estimate I have given my careful consideration to Mr. Blanc's estimate of "further relative works" as set forth on page 6 of your report of December 1, 1901, and have amended these wherever I considered them excessive or insufficient. Further, in his estimate of "Furnishings, fees, &c.," on page 7 of the same report, I have reduced Mr. Blanc's commission to correspond with the reduced cost and also the measurer's fees, which are shown on the completed asylum to amount to 14,000*l.*, but there is probably something else included in this item, as in England a commission of 1½ per cent. on the cost, with some further allowance for printing, would be considered ample for this purpose. I may further state that in studying the reports submitted to me I noted the very reasonable suggestions of the Medical Commissioners of April 23, 1901, and think that Mr. Blanc should give consideration to them and amend his drawings accordingly. The Medical Commissioners conclude their memorandum by referring to the provisions to be made for escape in case of fire. If not going beyond my instructions, I should like to state that the English Lunacy Commissioners require that alternative ways of escape shall be provided from all dormitories—that is, two doorways to each room and two staircases in each block, one at either end, so that in case of fire in any portion of the building every patient can escape either one way or the other. I think Mr. Blanc's designs would be improved by the adoption of this principle.

In the report of your special committee some useful suggestions are offered—particularly No. 4—as to size of workshops and other buildings, but I do not think that much is to be gained by adopting their fifth suggestion. Very little will be saved in point of cost by increasing the accommodation of the homes to sixty, and in an asylum for only 1,000 patients I am distinctly of opinion that the utility of these buildings would suffer materially by thus increasing them, inasmuch as the opportunities for classification and segregation would thereby be seriously restricted. In conclusion, I beg to summarise my replies to your inquiries and my recommendations as follows:—

#### Summary.

1. "Whether the plans can be modified or remodelled so as to reduce the total cost to a sum representing 300*l.* per bed or less?"

My answer to this is, "Yes, subject to my correctly interpreting your meaning of price per bed."

2. "Whether the plans can be adapted to brick harled?"

To this I again reply in the affirmative.

3. "Whether by building with brick harled the cost will be reduced to any, and, if so, to what extent?"

I say in answer to this that by adopting the simplest form of brick harled treatment the cost may be reduced to something less than 300*l.* a bed.

4. "To advise the Board generally in the matter."

My advice is

(a) To adhere to stone construction, but in a less expensive form, and to modify the interior treatment of the different buildings, cutting down the cost in all legitimate ways. By doing this a more suitable form of construction than brick harled will be obtained at comparatively little extra cost, and much time and expense in other ways will be saved.

(b) To commence building operations at once by erecting the infirmary and administrative block. This will test the cost and suitability of the form of construction recommended, and relieve to some extent the urgent pressure for accommodation.

At the meeting of the Edinburgh District Lunacy Commissioners on Tuesday it was decided to act on the recommendations of Mr. Hine, and that Mr. Blanc was to consult with Mr. Hine and amend the plans, specifications and schedules in accordance with their views, to advertise for offers and to report.

## THE CHICHESTER CAMPANILE.

THE following report on the detached campanile at Chichester has been prepared by Mr. Somers Clarke at the request of the executive committee for the repair and restoration of the cathedral:—

The walls of the tower are in a splendid state, solid and sound. I cannot detect a crack or settlement in any part. It is the surface only that has suffered, and this has been eaten away by the weather to a depth in some places of several inches. The tops of the four-angle turrets, and the parapets both of the octagonal stage and of the square top of the tower, need attention.

The tower was originally faced with stone from Quarr Abbey—also known as Binstead stone—from near Ryde, Isle of Wight. In the fifteenth century this stone was a good deal used in the South of England, and may be found at Winchester Cathedral and other places. It is a limestone of not very enduring quality. The quarry is now closed and is said to have been exhausted.

Seeing that this tower is one of the latest of the cathedral buildings, dating from the fifteenth century, and that its surface has perished far more seriously than the surfaces of some of the oldest parts of the cathedral, it would be a folly to reopen the quarry on the chance of finding more of the indifferent material. It will be better to use where it is necessary a stone which has already been tried and not found wanting.

It would be an easy though perhaps an expensive remedy to recase the exterior of the tower.

By doing this very much of that look of majestic and venerable age, by which this tower is especially to be remarked, would be lost.

We should have a new tower and not the old one.

More especially would this be the case if the angle turrets and parapet of the octagon are seriously interfered with by fanciful restoration.

Certain old prints and drawings show us that at one time the angle turrets were crowned with a battlemented parapet. The evidence thus given does not, however, go so far back as to prove to us what was the original crowning feature of these turrets. Probably there were battlements.

It is quite certain that the existing parapet of the octagon is not now in its original state.

It was a pierced parapet, higher than it now is; but what was its height? Whether it had or had not pinnacles or other features at the angles cannot be told.

Is it not better to preserve what we have rather than to launch upon fantastic flights of restoration, in effecting which the little evidence we have will be destroyed?

I most strongly urge that the chapter accepts things as they are, and puts "restoration" far from it.

It will be impossible to avoid putting some new stone in the upper parts of the angle turrets.

The stone is in some cases flaking away and falling, sometimes in powder and sometimes in pieces of considerable size, so large as to be a source of danger.

It would be a good thing to place some iron hurdles round the tower, to prevent people loitering too near its base.

The parapets of the square tower top have been patched up at different times with Portland stone and are now falling to pieces; parts are, indeed, quite insecure.

The lead gutters behind these parapets are much dilapidated. It would be well to replace them with asphalt, which, once properly laid, is practically everlasting, and is a much greater security against wet and frost than leadwork.

In the tower there now stands a long flagstaff. This was, I understand, to have been placed on the top of the octagon roof secured to its roof timbers.

In some of the old drawings there are indications that a small pinnacle or spirelet stood up from the middle of the roof, but an ugly stalk of a flagstaff would not only be at variance with the grave horizontal lines of the tower itself, but would be a source of insecurity. The action of the wind on a long staff, even without a flag, is incessant. It worries the timberwork, and if stays be attached, as they have been in times past, to the angle turrets (structures not very solid in themselves) their masonry suffers.

If it is desired to set up a flagstaff it would be best to place its foot alongside the base of one of the angle turrets, and to steady it by short stays attached to the octagonal stage of the tower. The piece of the flagstaff on which the wind could act would then be comparatively short, and would not be a source of danger either to the roofs or the masonry.

As regards the preservation of the surfaces of the masonry of the tower, it is desirable that every effort should be made to indurate the surfaces of the existing stonework, only setting in new stones where they are absolutely necessary.

Professor Church (professor of chemistry, Royal Academy) has of late years turned his attention to the induration of stonework decayed by weather and the vitiated air of towns. He has satisfied himself that a solution of baryta is very efficacious, and at the instance of the Office of Works has made experi-

ments at Westminster Abbey, where the carvings and surfaces at the chapter-house were disintegrating very rapidly. There is certainly no better authority to which we can go than to him.

Specimens of dust from decaying surfaces of the bell tower have been sent to him. These he has analysed, and of opinion that the baryta solution may very properly be applied.

Professor Church recommends that the application should first be made on the north face of the tower. The builder has been instructed to set up a small platform, its floor level with the top of the plinth, and with boards arranged above it sloping roof, so that should any pieces fall from above they will not come directly on the heads of those applying the solution. Full details of the method of application and a machine with which to do it are in the hands of Prebendary Bennet.

If the solution solidifies the surfaces of many of the crumbling stones, it is obvious that very much money may be saved, whilst the tower will retain its appearance of venerable antiquity.

Until the efficacy of the solution has been tested it will not be desirable to begin any system of repair to the masonry by inserting new stones. Beyond small pieces coming off there is nothing to fear.

When the effect of the solution has been ascertained in some nine or ten months' time, the complete repair and statement of masonry where it is necessary could be taken in hand.

## SANITARY PROGRESS.\*

MY first duty is to thank you, and through you the Council of the Sanitary Institute, for the honour you have done me in electing me to fill this chair.

For my own part, I do not know whether it is altogether the best selection that could be made, for on the one hand I conceive that these congresses should to a large extent invite the criticism and suggestions of those public men who are professionally connected with the great and important subject with which most of us present are continually dealing; and on the other hand, I feel that I can claim to bring before you novel views, and were I left to my own inclinations, would prefer to sit as a listener that I might perhaps benefit by your deliberations.

Looking back at the advances in sanitary science which we have witnessed during the past forty years of my professional life, I must congratulate the Sanitary Institute on the great success which has followed their endeavours in promoting the health and happiness of the people of this country. Compared with forty years ago, the cleanliness and sanitation of our large towns has wonderfully improved; but not only is this the case, for there has grown up in the public mind during that period a conviction that it is only by the rigid enforcement of proper sanitary regulations that the public health can be preserved. Much has been learnt and many theories have disappeared. Increased experience led us to look at the subject from a practical rather than a theoretical point of view, and the main directions in which advances have been made are by endeavouring to conform to the great laws of nature which govern the removal of dead organic matter and the preservation in a state of purity of the air we breathe and the water we drink.

At an early period it was seen that it was dangerous to public health to live in the immediate neighbourhood of decaying organic matter. But as to the nature and cause of this decay little was known. In a general and in a not very clear manner it was conceived that dead and decaying organic matter was in some way acted upon by the oxygen in the air, and in a certain sense burnt up or reduced to innocuous substances. During the past twenty years this crude idea is after much study by many of the ablest scientific men of our day given place to a certainty which now rests upon an irrefragable basis. It is now known that the decay of dead organic matter is a very complex process carried on by countless numbers of micro-organisms, which in their turn divide the work to be performed into various stages. In this country, where most of our sewage is waterborne, the process is best illustrated by the functions performed by the liquefying and nitrifying organisms respectively.

This is not the occasion for me to dilate on the detail work which has been performed in this direction, but of which you will have an opportunity of judging when the valuable papers are read at the joint Conference of this and Section III.

At the present moment I am merely referring to the subject for the purpose of drawing attention to what I conceive to be the greatest advance in sanitary science during the past forty years. And the lesson which we learn is that advance can only be made by long and patient observations, such as those which characterise the work of such men as Pasteur, Koch and a host

\* An address by Sir Alexander R. Binnie, M.Inst.C.E., president of the Section of Engineering and Architecture of the Manchester Sanitary Congress.

others. Our object now is not to veil the process of decomposition by the introduction of what were called disinfectants or deodorisers, which too often merely resulted in substituting one unpleasant smell for another, which was more objectionable, but as far as possible to remove from our inhabited areas all decaying organic matter, and as far as possible by proper appliances, not yet completely understood, hasten those processes of nature which lead to the destruction of decaying matter from a harmful to a harmless condition.

While this may be said to be in broad general terms the way along which we are now travelling, yet its application is rendered more difficult than might at first appear, owing to the fact that most of the sewage of our large towns is water-borne sewage, in which the quantity of decaying matter bears but a very small proportion to the total bulk of fluid to be dealt with, as well as to the fact that even the smallest quantity of decomposing matter is sufficient to destroy the purity of exceedingly large volumes of water. And from these latter facts we have gradually learnt the lesson that in a humid climate like that of Great Britain perennial irrigation on a large scale cannot be carried out with that financial advantage which was at one time expected. I do not by this wish to be understood as implying that sewage irrigation may not form a very important function in the purification of our sewage effluents, but rather that such a process is not likely to prove profitable in the long run. Besides the water-borne sewage of our towns there is always a large amount of comparatively dry matter, such as street sweepings, ash-bin refuse, and the like, which does not enter the sewers, and which is an exceedingly expensive matter to dispose of, especially in the large and congested areas of our great towns. Gradually there is growing up for the disposal of these substances a return to one of the oldest known sanitary processes, viz. destruction by fire; and under the improved methods now adopted we are arriving at processes which can be carried on with celerity and without offence, in the immediate neighbourhood from which the substances are derived, and at the same time a certain amount of heat which is evolved in their destruction can be utilised for secondary purposes.

Intimately connected with sewage disposal and the preservation of the public health is an ample and sufficient water-supply, the importance of which has led almost all our large towns to resort to uncontaminated sources of supply far removed from the possibility of pollution.

And there can be no doubt that a pure and uncontaminated water-supply is one of the first necessities of public health. As to whether the water should be soft or hard is largely a matter governed by local circumstances, or in some cases by the requirements; and the experience which we have gained up to the present leads to the conclusion that provided that the water is otherwise pure and unobjectionable, the public health is little or not at all affected, except perhaps in the case of such diseases as calculus and the like.

I was brought up in the belief which I still hold, that a water-supply should be not only pure and uncontaminated, but beyond suspicion of any possible pollution whatever.

However, in recent years I fear that a little laxity, due probably to our improved sewage purification, is creeping in, so that we find large populations supplied with water which has received directly or indirectly many sewage effluents.

From this I draw the conclusion that either our large towns, such as Edinburgh, Glasgow, Manchester, Leeds, Liverpool, Bradford, Birmingham and many others, have uselessly expended millions of money in attaining an ideally pure water-supply, or that the people of London are running a great risk in continuing to depend almost entirely on the waters of the Thames and the Lea, which receive the more or less clarified sewage effluents of over a million and a quarter of persons.

And I am inclined to believe with the late Sir George Buchanan that large populations can continue to drink water which has been contaminated with apparent impunity, but that sooner or later such water takes upon itself morbid qualities which lead to death and disease.

Nearly connected with a pure water-supply is pure air. As to some extent is insured by proper drainage and house ventilation, but it cannot be denied that the air of our large towns is far less pure than could be desired. And this to a large extent is no doubt due to the smoky atmosphere in which our town dwellers reside, and this when combined with mist and fog becomes at times one of the greatest evils from which our urban populations suffer.

As to the prevention of fogs, no doubt a great improvement is effected by proper drainage, but when towns or cities are situated in large river valleys, such as the Thames, and like London, one-tenth of which is situated on areas below high-water level, it is unreasonable to expect that fogs can be abolished.

However, much can be done in the future to alleviate a great deal of the dirt and misery caused by a combination of

fog and smoke, by a proper and more economical application of our fuel for heating purposes.

As at present used the domestic fire in London, which burns coal in an open grate, is largely responsible for the contaminated state of the air; not only so, but it is a most wasteful mode of utilising our fuel.

What really is required is a cheap and economical heating gas; at present, however, our gas manufacture being principally directed to produce a pure gas of high illuminating power, owing to its expense is in most cases a bar to its utilisation for heating purposes.

However, it is not an impossibility to produce a cheap gas of great heating power, but of low illuminating efficiency, which latter can be increased by the use of proper incandescent mantles.

Nor is this an imaginary or ideal conception, for in the present Session of Parliament one of our largest London gas companies has obtained power to purchase 120 acres of land for the purpose, as stated by their chairman, Sir George Livesey, of carrying out a system of gas manufacture such as that I have above described.

With electricity for the internal illumination of our houses, with gas fuel instead of the crude coal for heating and cooking purposes, and a cheap incandescent-gas lamp for street use I feel certain a great improvement could be made in the air breathed by our urban populations.

One of the greatest evils of our modern town life is the crowding together in congested areas of vast masses of the less affluent members of the community, and unfortunately owing to their circumstances they are unable to live in any but the poorest tenements. The difficulties which surround this problem are due in great part to the large rise in the value of land in our great towns, owing to that aggregation of population the evils of which we desire to avoid. But perhaps we may draw a lesson and see how this problem of increased urban land value versus dense population, is working itself out in a class somewhat above the poorest.

The City of London, properly so called, and the districts of Holborn and the Strand, as an example, were formerly thickly inhabited by traders and tradespeople, together with the vast commercial population which follows commercial life. Within the last fifty years, however, so enhanced has become the value of land and houses for purely business and commercial purposes, that the former residents have found it impossible to reside in those districts and more economical to migrate to suburban areas; consequently our census returns show us that the resident population in the City, Holborn and the Strand is rapidly decreasing.

The consideration of these facts at once points to the conclusion that some means of transit must be afforded for the workers, who are employed in our centres of commercial industry during the day, to their places of residence in the suburbs.

Much has already been done by the provision of railways and tramways to meet modern requirements, but I think that the lesson that we have to study in the future in dealing with this question is the dispersal of our redundant population over larger areas, and the removal, as far as practicable, of our manufactories from our towns into the country.

This latter with our improved telegraphic and telephonic communication should not be impossible of achievement, and may even prove an economy to the manufacturer by locating his works in districts where land is cheap, which would allow of the construction on an enlarged area of more healthy dwellings for the labouring population.

The dispersal of our London population in the manner above suggested has been well illustrated during the past few years by the result of the working of the Central London Electric Railway and the Electric Tramways, which extend from its western extremity towards Hounslow, Isleworth and Uxbridge.

An investigation of the low fares at which our working population can travel by this route, together with the fact that the Central London Railway alone is able to pay its shareholders 4 per cent. per annum on their investments, should prove an encouragement to other persons to do likewise. But when we have done our utmost to disperse our population as far as practicable, there will always remain a very large proportion of workers who must from the nature of their occupations reside on or near the site of their labours, and for their accommodation improved dwellings must be provided, and we have in London in the Boundary Street area, opened some years ago by the King and Queen, and in the new buildings being erected at Millbank by the London County Council, examples of what can be done to improve the habitations of our labouring classes.

In the above remarks I have briefly touched upon what have been the great improvements in the past, and on the various topics which to my mind deserve attention in the future. This is not the time to dilate upon the details connected with these various subjects, even were I qualified to grapple with

them; they, however, will be more fully brought before you in the papers which will be read before this and Section III.

To attain, however, the desired ends, I consider that much could be done if all these subjects touching upon municipal life, such as drainage, water supply, gas supply, housing problems and transit, were left more fully in the hands of the governing bodies of our large municipal towns.

These bodies are elected by the public suffrages of the rate-payers; they are representative in the fullest sense of the word, and their members are all of them (and I have had a life-long experience of our municipal bodies), fully competent to deal with these subjects, and could do so, I feel confident, were they relieved from many of the restrictions now placed upon them by our sanitary legislation. Could this be effected not only would a great advance be made in the carrying out of these important sanitary improvements, but the Imperial Parliament would be relieved of a vast amount of work which now presses upon our legislature.

I cannot conceive a greater waste of energy and valuable time, which could be devoted to matters of higher national concern, than to see committees of Parliament and the House of Commons discussing for hours and days matters of purely local interest, of which its members can have in most cases little knowledge and still less interest.

I feel strongly as an old municipal officer that more is to be gained by giving a free hand in all these matters to our local governing bodies and county councils, than in devising new sanitary legislation, which unfortunately appears to hinder rather than expedite the great objects which we all have in view.

In the above remarks it may be said that I have brought before you but the old questions which have been so often discussed. I refrain, however, from troubling you further with a more extended address, as I think that I have suggested some points which are worthy of your consideration, and I feel that if good is to be done in the future it does not flow from addresses such as this, but from the consensus of opinion which the Sanitary Institute has always cultivated, and which is gradually permeating the whole body of the people.

### GENERAL.

**Mr. Silvanus Trevail, F.R.I.B.A., J.P.**, president of the Society of Architects, has been invited to continue in office for the ensuing session, and has consented to be nominated for the second time.

**The Bishop of Reading** has presented a decorative font-cover, designed by Mr. G. F. Bodley, A.R.A., to the cathedral at Oxford, in memory of his late wife.

**M. Paul Albert Besnard** has been elected president of the jury of the exhibition of decorative arts at Turin. Mr. Walter Crane is the honorary president. The other members of the international jury are:—Fierens Gevaert, Charles Gross, Albert Hoffmann, E. de Radisics, E. von Suhr, E. Folcher, Francis Newberry, David Calandra, Alfredo Melani, Jean Tesorone, Joachin, Toesca di Castellazzo.

**The Local Government Board** has requested the Metropolitan Asylums Board to supply information regarding the spread of smallpox by workmen who have been engaged in building hospitals for patients suffering from the disease.

**The Shah of Persia** has received in Paris M. Gervex, the painter, who brought him the portrait for which he sat two years ago, and the artist was invested with the Order of the Lion and Sun.

**The Petersfield Rural District Council** resolved at their last meeting to grant the road surveyor (Mr. L. Waters) 2½ per cent. on the amount (about 1,000*l.*) recovered from the War Office in respect of excessive military traffic over the district roads; in consideration of his extra work in preparing estimates, &c.

**The Belgian Government** has practically decided to construct an electric railway between Brussels and Antwerp. This will be the first long-distance rapid electric service in Europe. The contract will call for a speed of about a mile a minute. The route is twenty-six miles long, and the trains will do the distance in twenty-five minutes.

**The Queen** has graciously consented to continue her honorary membership in the Royal Anglo-Australian Society of Artists, which, as Princess of Wales, she did the Society the honour to accept in 1895.

**Mr. E. P. Hannaford**, who was for several years chief engineer of the Grand Trunk Railway, died suddenly at Montreal on August 18. He was born in Devonshire in 1834, and was employed up to 1855 on the South Devon Railway.

**The Firms of Dorman, Long & Co., Ltd.** and Bell Brothers, Ltd., have amalgamated. Sir Lowthian Bell will become chairman of Dorman, Long & Co., and three of the directors of Bell Brothers are to join the board, Mr. Dorman taking the position of vice-chairman and managing director. The capital of Dorman, Long & Co., when this operation is

completed, will be 1,050,000*l.* The two firms concerned are the largest iron and steel manufacturers of the north.

**The Prussian Forests** have since 1900 yielded in volume 861,000,000 cubic feet, in addition to 2,709,000 cubic feet of oak-tanning bark, 3,408,000 cubic feet of osiers, and 1,809,000 cubic feet of other wood, a total of nearly 869,000,000 cubic feet. The 86,151,083 acres of land in Prussia, 20,435,499, or 23·7 per cent., are occupied by forests and orchards.

**The Duke of Bedford** has offered to the Amptill Rural Council a site of 17 acres and a donation of 500*l.* towards the cost of a permanent isolation hospital for the use of the district, which includes the whole of the Duke's Woburn Abbey estate. The Council had been deterred by the expense from carrying out this long-desired project.

**The Improvements** to the parish church of Whippingham, Isle of Wight, which are to be carried out at the expense of the Royal Family as a memorial to Queen Victoria, have now been commenced. The sanctuary is to be enlarged, and the reredos to be erected will represent the Last Supper, the figures being in a panel of alabaster. A portion of the chancel roof over the sanctuary is to undergo alteration, and the chancel floor part laid with marble. The memorial of the parishioners of Whippingham is to consist of an oak pulpit and a reading desk.

**The Remains** of Roman smelting-works have been discovered during the drainage operations at Stamford. A large number of coins, including gold angels, have been discovered near the site.

**The Manchester Dock and Warehouse Extension Company** are about to expend half a million sterling on dock sheds, electric cranes, &c., in connection with the Ship Canal.

**The Greek Government** have decided to restore the "Lion of Chæroneia," the monument erected in honour of the heroes who fell in the battle of Athens and Thebes against Philip. The monument erected by the Athenian Treasury, the parts of which have been found in the excavations made by the French School at Athens, will also be restored. Delphi under the care of M. Homolle, director of the school at Athens.

**Mr. Albert E. Barton**, of the surveyor's department of the county borough of West Bromwich, has been appointed surveyor and waterworks manager to the East Cowes Council.

**The Metropolitan Asylums Board** have received the official approval for the plans of the additional staff accommodation at Caterham Asylum, to be erected at a cost not exceeding 3,790*l.* The Board have accepted the revised tender of Messrs Entwistle & Gass, of Atlas Works, Bolton, for the supply and fixing of laundry machinery and plant at the Joyce Green Hospital at the sum of 7,682*l.* 2*s.*, in accordance with plans and specifications prepared by the engineer to the Board.

**The Oldham Art Gallery** has been increased by five works bought from the spring exhibition. Three of these are from the brush of the late Mr. William Stott, of Oldham, while the other two are by Mr. S. Melton Fisher and Mr. Arthur Tucker.

**The Countess of Milltown** has made over by deed to the National Gallery in Dublin all the pictures, plate, furniture and other objects of value in her eighteenth-century residence at Russborough, Blessington (county Wicklow), and directs them to be kept in separate rooms and marked as the Milltown Museum.

**M. Hanotaux**, the French ex-minister, has presided over a congress on hydraulic-power which took place at Grenoble. A State monopoly or regulation of water-power was among the subjects discussed.

**Mr. Arthur S. Cope, A.R.A.**, has been commissioned to paint the portrait of the Earl of Northbrook, which is to be hung in the county buildings at Winchester as a public memorial of his services to the country and to the county of Hampshire, of which he has been for many years Lord Lieutenant.

**In the Cape House of Assembly** on Friday last, Sir Gordon Spriggs moved the second reading of the Harbour Board Loan Bill, providing for a loan of 2,795,400*l.* for improving the harbours of Table Bay, Port Elizabeth, East London and Mossel Bay. The Premier urged that greater facilities would be required at the ports to meet the anticipated expansion of trade. Mr. Merriman expressed his willingness to support the Bill as it would be referred to committee.

**The Congress of the British Archæological Association** will begin on Monday next with a meeting in the Westminster town hall. During the week there will be visits to Rochester, Cobham, Godalming, Guildford, Colchester, Westminster, Harrow, &c.

**The Work** of widening London Bridge, for which Messrs Pethick & Co., of Plymouth, are the contractors, is being rapidly pushed forward. Large steel structures have already been erected on either side of the bridge to carry the extended footways.

## EDITORIAL NOTICES.

view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

authors of signed articles and papers read in public must necessarily be held responsible for their contents.

communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

respondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

## TENDERS, ETC.

As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

## COMPETITIONS OPEN.

BERMONDSEY.—Sept. 16.—Designs are invited for artisans' dwellings to be erected on land at Rotherhithe, within the parish of Bermondsey, and known as the Fulford Street area. Premiums of 100*l.*, 60*l.* and 40*l.* will be awarded. Mr. Fredk. town clerk, Town Hall, Spa Road, S.E.

BIDEFORD.—Sept. 25.—The Town Council of Bideford are to erect municipal offices and a public library upon a site opposite the west end of the Long Bridge, Bideford, and invite designs for the proposed buildings. Premiums of 50*l.* and 10*l.* respectively are offered for the designs which may be placed by the Council first, second and third in order of merit. Designs and descriptions, &c., are to be delivered to Mr. Wm. B. Seldon, town clerk, 18 The Quay, Bideford.

CAPE TOWN.—Jan. 31.—The Council of the University of Cape of Good Hope invite designs for the erection of university buildings. Premiums of 400*l.*, 200*l.* and 100*l.* will be awarded to the authors of the designs placed first, second and third respectively. Particulars of the competition may be obtained on application to the Registrar at Cape Town, or to the Agent-General in London.

GREENWICH.—Oct. 9.—Designs are invited for a public library (with chambers for chief librarian's residence) to be erected at a cost of about 6,500*l.*, with fittings, on a site about 7,000 feet super, in the borough of Greenwich. Premiums of 50*l.* and 30*l.* are offered. Particulars can be obtained on application to the Greenwich Borough Council.

INDIA.—Nov. 1.—Competitive designs are invited for the erection of a memorial to Her Majesty the late Queen Victoria at Allahabad. A premium of 2,000 rupees will be awarded to the design selected by the committee. Mr. H. Nelson Wright, Indian Civil Service, honorary secretary, Queen Victoria Memorial Fund Committee, Allahabad, India.

LIVERPOOL.—Sept. 15.—Designs are invited for new labourers' dwellings to accommodate about 2,500 persons, to be erected on the Hornby Street area. Premiums of 250*l.*, 150*l.* and 100*l.* respectively are offered for the first three selected designs. Particulars will be supplied by the Town Clerk.

MAIDENHEAD.—Oct. 1.—Designs for free library. Premiums offered of 50*l.*, 20*l.* and 10*l.* respectively. Mr. John Kirk, town clerk, Guildhall, Maidenhead.

NEWARK.—Oct. 14.—Designs and suggestions are invited for alterations and additions at the infirmary, Bowbridge Road, Newark, comprising a board and committee-room, a new mortuary and provision for twenty extra beds. A prize of twenty guineas is offered for the best plans sent to the office of Mr. M. H. Colton, clerk, 27 Lombard Street, Newark.

STROOD.—Oct. 15.—Plans are invited for further hospital accommodation on a site recently acquired by the Strood Rural District Council in Whitehill Road, Cobham. A premium of 15*l.* 15*s.* is offered for the best set of plans submitted.

## BUILDING AND BUILDERS.

THE estimated cost of new workshops about to be erected for Mr. J. Joseph, of Hollybush Gardens, is 1,157. Mr. Edward Brown, of 150 Minories, London, E.C., is the architect.

THE new operating-room about to be built at the infirmary, East Dulwich Grove, London, will be from the designs and under the supervision of Mr. G. D. Stevenson, of 13 Regent Street, Cheapside, London.

A MEMORIAL-STONE has been placed in the spire which is being added to South Leith United Free church. The church was built over twenty years ago, and the spire, which will be 125 feet high when completed, was presented by a lady, Miss Cant, in memory of the life and reign of the late Queen Victoria. The stone, which was laid by Miss Cant, bore the simple inscription, "V.R. 1837-1901."

RICHARD WALLACE, a painter in the employ of the Ball Corporation, was engaged on Monday morning in painting property in Carr Lane, standing on a ladder about 20 feet high. The rung on which the man was standing gave way, and he fell to the ground. He was picked up insensible, and died shortly afterwards. He was 49 years of age, and it is reported that he has left a widow and eight children.

THE second annual excursion of the Master Builders' Association and Building Trades Exchange of Edinburgh took place last week to Alloa. A company numbering about fifty gentlemen travelled from the Waverley station to Alloa, thence in brakes to Rumbling Bridge. Rain fell heavily during the greater part of the day, but the weather cleared up in the afternoon, and the drive back to Alloa was made under pleasanter conditions.

# The "ONE" Range.

PATENT 1331/01.

M. F. Co. LD. R.

These Ranges are Exhibited by the following London Firms:—

R. ADAMS, Newington Causeway;

CLARK, HUNT & CO., Shoreditch;

O'BRIEN, THOMAS & CO., Upper Thames Street;

R. H. & J. PEARSON & CO., Ltd., Notting Hill Gate;

ROWNSON, DREW & CO., Queen Victoria Street.

Agents for Liverpool:—

THE WELL FIRE CO., Ltd.

The above shows the heat concentrated under the boiler and the waste heat passing under the hot plate.

This Independent Range is fitted with hot water circulating boiler as shown in the sections, and the heat of the fire passes direct under the bottom of the oven.

A Fire Brick Dome and damper is fitted over the fire, which enables the heat to be concentrated at pleasure on the hot plate or boiler, the waste heat of either passing under the other, thereby utilising what is usually lost.

The above shows the heat of the fire concentrated on the hot plate and the waste heat passing under the boiler.

The casing and oven door are lined with slag wool and a third oven can be arranged if required.

At the monthly meeting of the Ossett Town Council, held on Monday evening, Councillor Horsnell, chairman of the general purposes committee, moved the adoption of Part III of the Housing of the Working Classes Act, 1890. He stated that there was a considerable demand in Ossett for more working-class houses, and especially for those of an improved kind. A sub-committee had inquired into the matter and consulted the town clerk as to the Council's powers, and unanimously reported in favour of the course which he now proposed should be taken. Councillor Taylor seconded the motion, and mentioned that the Council had three or four acres of land that could be used for the purpose of building houses. The motion was supported by a number of members, and carried almost unanimously.

"ACCIDENTAL DEATH" was the conclusion arrived at at the coroner's inquest held in regard to Henry Russell (26), bricklayer, of 36 court, 6 house, Park Lane, who fell from a scaffold upon which he was working, near Trinity Road, Birchfield. Deceased was engaged in "filleting" a roof 21 feet from the ground on the morning of the 30th ult., and owing apparently to the step-board on which he was standing being slippery after the rain he lost his balance and fell over the side, sustaining a fracture of the breast-bone and internal injuries. He was removed to the General Hospital, but died on Friday morning last. Messrs. Wilkinson & Waterman, the builders who employed the deceased, stated, in reply to Mr. Jackson (inspector of factories for Staffordshire), that they were not aware that the Home Office had issued recommendations for carrying on of building operations with greater safety. They would be pleased, they said, to obey the suggestions of the Department.

### ELECTRIC NOTES.

THE Darlington and Tebay branch of the North-Eastern Railway crosses the river Eden at Kirkby Stephen at a point where the river forms a noisy and foaming cataract well known as the "Coopkarnel Hole." The North-Eastern Railway Company have for some time been engaged upon the erection of a power-house, and are now utilising the "force" at the waterfall for the working of a turbine and dynamo, to provide electrical power for the station and mineral sidings at Kirkby Stephen. Close to the spot whence the electrical power is derived the rocks in the bed of the river contain a great

number of holes, 1 to 7 feet in diameter and 6 inches to 9 feet in depth, whilst in some places the clefts or cavities are so wide as to receive the whole river, which in some seasons is thus rendered stagnant. To provide against a temporary failure of the water supply, the North-Eastern Railway Company are having an electric motor, which is replacing the present steam-engine for driving the machinery in the workshops, arranged so that it can be driven as a dynamo from the old steam plant, and so keep the accumulators charged. All the station buildings, locomotive workshops and sheds, signal cabins and signals are to be supplied with the electric light, whilst the cattle mount and turntables will also be similarly illuminated. The works are now practically completed, and the new illuminant was adopted on Friday last.

THE annual report of the Ayr Burgh electrical engineer (Mr. A. J. Fuller) states that the number of units sold for private lighting was 102,553, giving a revenue of 3,765*l.*; for public lighting, 330,560 units, giving a revenue of 2,147*l.*; and for traction, 132,105 units, yielding a revenue of 827*l.* The total revenue was 6,973*l.*, and the expenditure was 4,483*l.* The surplus balance of 2,490*l.* was 756*l.* short of meeting the payments to interest and sinking fund. The capital expended on the works to date was 78,999*l.*, an increase during the year of 22,841*l.* Mr. Young, convener of the lighting committee, stated that of 101 provincial towns reporting, only sixteen showed less works' cost than Ayr, the cost being 12*d.* per unit.

### VARIETIES.

NEW schools and lecture hall in connection with the Baptist church at East Finchley were opened on Sunday last.

THE new premises of the Manchester Zionist Association in Cheetham Hill Road were formally opened on Sunday afternoon by Mr. Jacob Moser, of Bradford.

SPECIAL arrangements have been made by the Chancery Lane Safe Deposit Company for the temporary safe keeping of securities to meet the public convenience during the holidays and long vacation.

At a meeting of the committee of the Town Council of Crewe on the 4th inst. the competitive design of Mr. Henry T. Hare, F.R.I.B.A., for new municipal buildings was awarded the first prize. The new buildings are estimated to cost about 14,000*l.*

AT the Sparkhill police court on Monday Mr. W. G. Madeley, chairman of the justices, announced that that was the last sitting of the Court in the Institute Buildings. Next Monday the business of the division will be transacted in the buildings which have recently been erected.

A NEW Board school for infants, built by the Stockton School Board to meet the requirements of Portrack, a working-class district of the town, was formally opened on the 2nd inst. The school has cost about 1,700*l.*, and will accommodate 200 scholars.

ON Saturday afternoon the Nurses' Homes erected near to Conon Bridge, Ross-shire, at a cost of 1,520*l.*, as a memorial to the late Sir Kenneth S. Mackenzie, of Gairloch, Bart., were declared open by the Dowager Lady Mackenzie, widow of the deceased, who was accompanied by Sir Kenneth J. and Lady Mackenzie and family.

THE open competition amongst sanitary engineers for the drainage of Eaton Bray, Bedfordshire, has resulted in the plans prepared by Mr. J. R. Elliott, A.M.I.C.E., of Nottingham, being selected as the best, and he has accordingly been appointed engineer to carry out the work. There were fifteen schemes submitted.

THE National Association of Master House Painters and Decorators of England and Wales will hold their ninth annual convention on the 23rd to the 26th of the current month. Mr. J. D. Crace, H.F.R.I.B.D., and president of the Institute of British Decorators, is to open the exhibition, and a carefully thought out programme has been arranged to combine business with social enjoyment.

A TERRIFIC gale from the south-east raged in the Lockerbie district on Wednesday in last week, doing great damage to property. About midday, when the storm was at its height, the front and central gable of the Carnegie Free Library, in course of construction, and composed of many tons of dressed stone, collapsed and fell on the street, and for some time completely blocked the traffic. Luckily no one was injured.

THE new schools erected at Spring Gardens, Stockport, which will accommodate 600 boys and girls in the mixed school and 220 infants in a separate infants' school, were formally opened on the 5th inst. Messrs. Stott & Sons, of Manchester, are the architects, and the builder is Mr. Josiah Briggs, Stockport. The principal room gives seating accommodation for about 1,000 persons. The style of the buildings

is English domestic, faced with red brick, with buff terra-cotta dressings and half-timbered gables.

THE Peter Memorial church, which has been built in the southern suburbs of Stirling for the United Free North congregation with money left by the late Mr. and Mrs. Peter members of the congregation, was opened on the 4th inst. by Mr. J. J. Stevenson, of London, is massive in character with a square tower intended to be surmounted by a crown, but which has, owing to the want of funds, not been proceeded with. The halls are commodious and convenient, and the whole building is lighted by electricity.

AT Pantasaph, Holywell, last week, was celebrated the golden jubilee of the Capuchin Order of St. Francis. At the same time the solemn blessing and opening of the new house for novices of the order, which has recently been erected and now forms part of the existing monastery buildings, took place. The novitiate is of local white limestone with Gwispur stone dressings, and is in the fifteenth-century style of architecture, in consonance with the older part of the monastery. The building is 112 feet long, 34 feet wide and 54 feet high, and on the ground floor there runs a continuous corridor 230 feet long. Pantasaph, it will be remembered, was intended as a Protestant church, erected by the late Earl of Denbigh when Lord Feilding, and Lady Feilding, but upon their entering the Catholic Church the new edifice was handed over to the church of their adoption, and directly afterwards the Friars of St. Francis Capuchin were invited to take over the charge of the church. Pantasaph therefore became the first foundation, after the relaxation of the penal laws, of one of the chief branches of the Franciscan Capuchin Order, which had come to England about 250 years previously. The community was formed in 1852, and their abode was the house once intended as the vicarage and now the guest-house of the monastery.

A GUIDE-BOOK that is well worth the perusal of those contemplating holidays is that issued by the General Steam Navigation Company, of 55 Great Tower Street, E.C. Besides a most attractive series of continental itineraries, covering Bordeaux, the Pyrenees, Auvergne, Algeria, Spain, France, Belgium, North Germany, Scandinavia, and Norway and Sweden, the company also affords exceptionally good facilities for visiting the Scottish Highlands. The convenience and comfort of passengers are studied in every way, and the tours are excellently designed. The company's steamers are well

printed and the cuisine all that can be desired. At all the principal resorts touched in the itineraries the leading hotels pour the G.S.N.'s coupons. Visitors to Scotland will find arrangement particularly handy. The cost of the Highland varies from 3*l.* 14*s.* 6*d.* for six days to 8*l.* 5*s.* for seventeen. The company is also running a service of daylight trips between London and Ostend. The twin-screw steamers "Lette" and "Swift" run from Irongate and St. Katherine's Pier, Tower Bridge, as follows:—From London, Tuesdays, Wednesdays and Fridays at 10 A.M., and Saturdays at 1 P.M., coming from Ostend Tuesdays, Thursdays and Fridays at noon, and Sundays at 1 P.M. A two days' trip to Ostend Saturday's boat (chief cabin), returning on Sunday, including board and carriage of bicycle, costs only 25*s.* 6*d.* A three days' trip, with meals on board and two complete days' hotel accommodation, with board, costs 31*s.* 6*d.* The boat saloon fare between London and Ostend (available for two persons) is 10*s.* 6*d.*, and the fore-cabin fare 9*s.*, but, of course, these charges do not include any meals. Altogether the facilities afforded by the General Steam Navigation Company are as good as any that can be found. The company will send on application (enclosing 2 penny stamps) to 55 Great Tower Street, E.C., a copy of the guide-book.

### TRADE NOTES.

MESSRS. COCHRANE & CO., LTD., Ormesby Ironworks, Loughborough, have received an order for 5,000 tons of 18-inch iron pipes in connection with the new waterworks scheme at Margate. The contract price is 30,000*l.*

THE additions to the Thornhill district hospital, Dumfriesshire, are being warmed and ventilated by means of Shorland's patent Manchester stoves with descending smoke flues and indirect exhaust roof ventilators.

MR. GEO. SHREWSBURY, of "Calda" fame, is just now putting out a series of price lists of his well-known hot-water heating apparatus which, as most of our readers are aware, covers a very extensive field, varying in cost from the modest radiatory heater at 19*s.* 6*d.* to comparatively elaborate installations suitable for the warming of halls, offices, &c. Shrewsbury also manufactures boilers of various kinds, dry and tailors' stoves, &c, while his excellent "Calda"

bath and lavatory heaters are too well known to need more than a passing reference.

MESSRS. GEORGE MILLS & CO., Globe Ironworks, Radcliffe, inform us that they have just received orders from the following companies for fitting up their premises with the "Titan" patent automatic sprinkler:—The Mutual Spinning Company, Ltd., Heywood (two mills); Arkwright Cotton Spinning Company, Ltd., Rochdale; Albany Spinning Company, Ltd., Middleton; and the Garfield Spinning Company, Ltd., Milnrow, near Rochdale; and that the following firms have just placed orders for their "Mills" horizontal flywheel pump:—The Gem Spinning Company, Ltd., Oldham; Monarch Spinning Company, Ltd., Oldham; Delta Spinning Company, Ltd., Oldham; Norman Spinning Company, Ltd., Oldham; Dawn Spinning Company, Ltd., Oldham; Magnet Spinning Company, Ltd., Oldham; Bank Top Spinning Company, Ltd., Oldham; Sun Mill Company, Ltd., Oldham.

### EAST FINCHLEY BAPTIST CHURCH AND SCHOOLS.

THE scheme for the erection of the East Finchley Baptist church and schools consists of a spacious church designed with nave and aisles and transepts and choir with three vestries, the seating all radiating on a circular plan from the pulpit. Accommodation is given for 764 adults on ground floor (including 72 in end gallery), or a mixed congregation of about 870 persons. A tower is placed at the corner of the church, which will stand at the corner of two roads, the Great North Road and Creighton Avenue.

The schools, which have now been opened, are of two storeys, consisting of a large hall with eight classrooms at the sides, partitioned off from each other by sliding panelled partitions, so arranged that the whole school can be thrown open into one large hall for use as a chapel until the new chapel is erected, and one at end opposite the platform. There are two front entrances and two staircases up to the galleries on three sides to be used for classes. There are also two very large senior classrooms in the rear, and a large infants' room, &c., and kitchen. The buildings are faced in front with split flints with stone dressings. Messrs. G. & R. P. Baines, 5 Clement's Inn, Strand, are the architects. The contract for the schools amounts to 3,634*l.*

**THE SANITARY INSTITUTE HEALTH EXHIBITION.**

THIS Exhibition, which is being held in connection with the Sanitary Institute Congress, was opened by the Lord Mayor at St. James's Hall, Manchester, on Tuesday afternoon, the 9th inst. It promises to be one of the most successful of those arranged by the Institute. The time is too short for us to give particulars in this issue of all the various exhibits in which our readers would be interested, but we hope to do justice to them next week. As usual a strong committee of judges have spent considerable time and given careful consideration in awarding medals to the latest productions and to improvements in well-established specialties of the various firms exhibiting. We append the preliminary list of awards:—

**Silver Medals.**—British Sanitary Co., for self-acting earth closet; Cannon Iron Foundries, Ltd., for enamelled cast iron; F. C. Calvert & Co., for carbolic acid preparations; Chalmers & Co., for van ambulances; Davis Gas Stove Co., for Metropolitan cooker; J. Defries & Sons, Ltd., for saturated steam disinfectant; William M. Glover & Sons, Ltd., for dust van; John Jones, for automatic air-tight manhole cover; Mather & Platt, for water softening apparatus; Vernon Parker, for Hassall's improved safety pipe joint; Shanks & Co., Ltd., for cast-iron porcelain-enamelled bath with quick accessible waste; W. Summerscales & Son, for laundry machinery;

**Bronze Medals.**—Ames Crosta Sanitary Engineering Co., Ltd., for Crosta surface water gully, with complete double trap; Ames Crosta Sanitary Engineering Co., Ltd., for stoneware conduits for electric cables; Burn Bros., for improved ball stoppers; Chalmers & Co., for two-wheel dust cart; Geo. A. Chattock, for reversible locking window; Davis Gas Stove Co., for cottage grill; Doulton & Co., Ltd., for spray lavatory with self-regulating valve; J. Duckett & Sons, for flushing tank and tipper; Eagle Range Co., for "Eagle" fire-grate with sliding doors; Ewart & Son, Ltd., for improved geyser apparatus with flue and dual valve; William E. Farrar, for adjustable bracket; William E. Farrar, for bead rim lavatory basin; William E. Farrar, for lattice gear quick-opening valve; Fireproof Plate Wall Co., Ltd., for fireproof partition walls; Fletcher, Russell & Co., for "Hurst" pipe joint; William Henry Gibbs, for spiral drain scraper; Hard York Non-Slip Stone Co., for Non-Slip materials; Wm. Harriman

& Co., Ltd., for Ford's stable channel; George Howson & Sons, Ltd., for urinals; George Howson & Sons, for white porcelain-enamelled fire-clay bath; John Jones, for connection for water-closet basins to soil-pipe; John Jones, for air-inlet ventilator for drains; Kenworthy & Co., for equipoise wringer and mangle; Kenworthy & Co., for Paragon washer, wringer and mangle combined; F. Nicholson Law, for improved dry seat; Loco Drainage apparatus Co., for rust pockets; Mather & Platt, Ltd., for water filter; Matthews & Yates, for fans for ventilation; Mellows & Co., for Mellows's eclipse glazing; J. Oakley Co., for glazed stoneware pipes; Oates & Green, Ltd., for glazed manger, with give-and-take fastener; E. Palmer, for ventilating column fitted with water fan; Vernon Parker, for silica filter for attaching to a domestic tap; Pendleton Sanitary Engineering Co., for movable ash-bin with metal case; Richard Ravenor, for Ravenor's drain-tester; Sanitary Appliances Syndicate, for the non-ball valve cylindrical store cistern; Sanitary Appliances Syndicate, for coin-receiving lock; Didon & Co., for automatic discharge regulator for reservoir; Shanks & Co., Ltd., for hospital lavatory, No. 2,085; Slack & Brownlow, for germ filters; Sharratt, for sanitary formaldehyde regenerator; Thomas Henry Tonge, for bakery fittings; George Barber Wilson, for gully and trap dredger; Outram & Co., for the Hassall water-closet.

*Deferred for Further Consideration or Practical Trial.*—Sanitary Block and Tile Pavement Co., sanitary block paving; William E. Farrar, "Torfit" urinals.

**Disinfectants, &c.**—McDougall Bros., Killgerm Co., H. Sanitas Co., Ltd., Hope & Sons, Jeyes's Sanitary Compounds Co., United Alkali Co., Ltd., Newton, Chambers & Co., B. Kühn.

**Supplementary List of Awards.**

**Bronze Medal.**—Vernon Parker, for blue brickware drain pipes; J. Hutchings, for Hutchings's cooking steamers; O. Howson & Sons, Ltd., for wash-tubs on pedestals; Mather & Platt, for automatic distributing and flushing valves; Lonon Tablet Co., for non-absorbent wall and ceiling covering; A. Thornton, for surveying and drawing instruments; Whyp Bros., for "Non-flam" safety flannelette.

*Deferred.*—Mather & Platt, gravity filter.

We understand that a further list of awards may be issued this week, and we venture to hope that one or two exhibits that have not yet received the recognition deserved may be included in it.

# SONNING BRIDGES.

THE agitation in connection with the proposed renewal of the bridges at Sonning, to which we referred last week, has elicited the following statement by Mr. T. Neighbour in the *Times* :—

As a member of the roads and bridges committee of the Oxfordshire County Council and also of the sub-committee which was appointed to inspect and report on the repair of the Sonning bridges, I ask you to allow me to state the plain facts of the case, so that the apprehensions which have been caused by the articles in your issues of August 28 and 29, and by the chorus which has been taken up by the lesser Press in consequence of your utterances, may be somewhat dispelled.

On April 19 this year local representations were laid before the roads and bridges committee, which consists of twenty members out of a total of fifty-nine in the whole Council, that attention to the condition of Sonning bridges could not any longer with safety to the traffic be delayed. A sub-committee, consisting of the chairman, Lord Valentia, and three other members, was appointed, who visited the bridges in company with the county surveyor and made a thorough examination of the structure. They considered and declared that it was absolutely necessary that the matter be taken in hand at once. In dealing with a business of this sort there are no considerations which I have not yet seen mentioned by any newspaper correspondent which it was absolutely necessary should be taken into account. First, the bridge must be strong enough to bear "the ordinary traffic of the district." The ordinary traffic of the district to-day includes steam traction-engines and the loads they draw. The second consideration is facility for the rapid passage of flood-water. Some hundred yards above this bridge the Conservators of the river Thames have recently put in a new weir, and the quantity of water which will in times of flood pass down the back stream—over which and over the mill-race these bridges go—will be greater than it ever was before. Two miles above this weir, on low-lying ground, the district of Lower Caversham is building houses and making streets with great rapidity, and it is probable there is no part of the river here provision for the effectual passing off of flood-water is more necessary than it is at Sonning. The existing bridges are composed of a brick pier by the French Horn, two short pieces of brick bridge somewhere near the centre of the whole, and a brick pier near the entrance to Mr. Witherington's mill. The intervening distances are spanned by wooden bridges

consisting of oak decking carried on "a forest of piles." I plead guilty to being the author of the rhetorical phrase to which your correspondent takes exception, the open side spaces being guarded by an iron beam and iron railings. The width along the whole length is 15 feet. I appeal with confidence to any one who has a knowledge of the river Thames in the winter as well as in the summer—which so many who talk about it do not possess—to say whether anything could be devised more likely to collect all the debris which floats down the Thames on the first heavy water in the autumn, and more certain to impede the flow of the water and impose a great and unnecessary strain on the structure which so retains such rubbish, than are the piles which to-day carry Sonning bridges.

It is absurd to speak of a blank cheque being given to the county surveyor; on the contrary, different plans of dealing with the bridges were discussed at great length and with great care at meetings of the sub-committee and of the roads and bridges committee at dates extending from April 19 to July 19, and the method which was finally recommended to the Council for adoption on August 6 was as follows:—The brick piers at either end of the bridges are to be widened and strengthened; the brick bridges near the centre are to be widened only, all on the up-stream side; and in place of oak decking and piles the spaces between the brick parts will be carried on steel girders, these girders to have one intermediate central support in the stream nearest the French Horn and two supports at equi-distances in the stream nearest to Sonning Mill. The sides of the bridges will be guarded by a lattice girder in place of the existing iron-rail fence, and this I somewhat regret. But I do most positively affirm that on the only public pathway from which the bridges can be viewed the sole visible alteration will be the lattice girder just referred to and the substitution of three very narrow supports in place of the oak piles. So far from the present appearance of the bridges being left out of sight it was a matter of earnest endeavour to retain it, and while having due regard to the widening and strengthening, it will be very largely preserved.

The division at the Council did not take place on the question of whether the alterations should be made or whether the plans were suitable, but simply whether it would be wise to proceed without the sanction of the Conservancy. No fear need be felt as to this. Everything that takes place at a public meeting does not find its way into the columns of the report, and an intimation was given even on August 6 that the scheme would without doubt receive the sanction of the Conservators.

Although the plans were not actually in the room at the time they were asked for, they were there within two or three minutes and were generally inspected, with the result that even those members who had at first demurred to the scheme afterwards expressed their approval. It is not to be expected nor, I suppose, desired that any public alteration should be carried through without meeting with public criticism; and in connection with this matter I personally am rather glad that the thing has been well ventilated, so that presently, when the work is completed and attention is again drawn to it, the action of the Council will be held to be justified.

### BRICKMAKING AND SANITARY LAW.

At the Sittingbourne Petty Sessions on Monday, Messrs. Smeed, Dean & Co., Ltd., of Sittingbourne, were summoned by the Sittingbourne Urban District Council under the Public Health Act of 1875 by reason of a nuisance arising from a large accumulation of London refuse upon their brickfield. On July 11 this heap of refuse, which was 40 yards long, 30 yards wide and 2 yards high, and is about 1,200 or 1,300 yards from the town hall, became ignited, and the fumes beat down into the town, causing much discomfort to the inhabitants. The evidence showed that correspondence had passed between the Council and the firm upon the subject, but no attempt had been made to put out the fire. Proceedings then followed. The London refuse, it was stated, consisted of the garbage and filth of the Metropolis, and the smell emitted from this when burning was unbearable. It was contended that this refuse was the rough stuff which had been sifted after the ashes used in the burning of bricks had been taken from it, and that for purposes of brickmaking it was useless. It was suggested that the defendants might have put up a destructor, as had already been done by one local firm with success, or they might have cut a trench through the heap and separated the burning portion, extinguishing the same with water or smothering it with earth. To all of these suggestions it was stated that those methods had been tried on previous occasions, and that the remedy was worse than the disease. Evidence in support of the prosecution was given by Mr. W. L. Grant (surveyor), Dr. H. G. Sutton (medical officer of health), Drs. F. Grayling and R. M. Boodle and Mr. F. G. Gibson (chairman of the Council), who spoke of the acrid, pungent nature of the smoke emitted from the refuse, which carried a long distance. The principal

witness for the defence was Mr. George Andrews, the manager, who said that his firm employed 1,400 hands and paid on 70,000l. to 80,000l. every year in wages. For the past 15 years the firm had burnt "rough stuff" without any prejudicial effect to health. What the public suffered from was, he maintained, the smell of the open sewer discharging crude sewage into the creek, of which complaints had been made by his firm to the Council for years. No attempt had been made by the defendants to put out the fire, as it was impossible to do so. It was stated that men working among the "rough stuff" had not suffered in health, but they had done so in consequence of the foul exhalations of the open sewer. The Court held in the case had been proved, and the defendants were fined 20s. were ordered to prevent a recurrence of the nuisance at their own cost, and to pay ten guineas costs. Notice of appeal to the quarter sessions was given.

### ELECTRIC TRAMWAYS IN LONDON.

SINCE the introduction of electric tramways in London last year extraordinary progress has been made (says the *Standard*) with this convenient and clean form of traction. True, the advantages have so far rested with the residents of West London, but it will not be long before electricity will supplant horse haulage on the southern routes of the London County Council, and then we shall have an excellent opportunity of judging the relative merits of the overhead trolley and the conduit systems of electric traction. The experts have been left to fight out amongst themselves the question which is the better method; the general public will doubtless vote for the cheapest, fastest, and most frequent and reliable service, and the most comfortable cars, irrespective of whether the motive power comes from underground or overhead.

Meanwhile, in view of recent and future developments it will be interesting briefly to relate the history of electric surface traction, having particular regard to the great progress it has made in London, and it will be seen that, considering the enormous difficulties which have had to be overcome, we are not so backward as is sometimes thought. Twelve years ago the passengers carried by tramcars in the whole of the United Kingdom numbered one million and a half a day, and of these London supplied one-third, although it had only one-eighth of the total mileage. In 1900, thanks to the introduction in various towns of electric traction, the passengers

umbered over 1,198 millions, and during the previous five  
ars 200 miles of track were added.

The first electric tramways operated in London were those  
om Shepherd's Bush to Acton, from Chiswick to Kew Bridge,  
nd from Hammersmith to Young's Corner, and these cars  
mmenced running in April last year, the whole distance  
ing 7½ miles. Since then great strides have been made, and  
ow it is possible to travel direct to Southall, Hounslow Heath  
nd Twickenham, and in the course of a few days Teddington,  
nd even Richmond, will be within a little more than an hour's  
omfortable journey from the centre of the city. But further  
r-reaching extensions, for which of course the necessary  
owers have been obtained, are in progress. To the west and  
uth-west the electric routes are shooting out and embracing  
the growing suburbs in the Thames Valley, and in a very  
w months we shall be "whizzed" in the open air to  
ampton Court, Kingston, Thames Ditton, Surbiton and other  
pulous districts. Nearly one hundred miles of tramways  
ill then be in operation on this particular system, and it is  
culated that no fewer than 200,000,000 passengers will be  
ried every year. The London United Tramways routes are  
rtunate in having the "Twopenny Tube" to connect the  
ank with the Shepherd's Bush terminus, and the Metropolitan  
nd District Railways to link the City with Hammersmith  
roadway. No doubt all the companies concerned, as well as  
e public, gain by these facilities for intercommunication,  
rticularly the Central London Railway with its frequent and  
pular service throughout the day. It is a matter for regret  
at the Metropolitan and District Companies cannot yet offer  
more attractive service, but that is only a matter of time and  
electrification." When the heavy and anxious task of con-  
rting the southern tram routes is completed, the London  
ounty Council will no doubt emulate the London United  
ramways and open up new districts and link others, and by  
at time—it is in the near future—London will be a con-  
nient place to live in and an easy place to get away from.

THE SANITARY ASSOCIATION OF SCOTLAND.

r the annual congress at Kirkcaldy. Dr. James B.  
ung, Edinburgh University, initiated a discussion on  
e provision for, and the maintenance of a wholesome  
mosphere in buildings, factories, workshops, workplaces,

&c., with special reference to the necessity for standards of  
pure air in such places. He said that in estimating the purity  
or otherwise of the air of occupied rooms, &c., the amount of  
carbonic acid present was generally taken as the index of  
pollution. For schools, churches, halls and public meeting-  
places generally ten parts per 10,000 might be taken as an  
attainable standard for good ventilation. For ordinary work-  
shops, e.g. where such industries as tailoring, printing, book-  
binding, dressmaking, &c., were carried on, a standard of  
purity in terms of carbonic acid should be fixed. The difficul-  
ties of ventilation there were not great, and the necessary  
means need not be very expensive. Very efficient fans, readily  
fixed, were now procurable at moderate cost, and electric  
current for driving them was, in most of our large towns, fairly  
cheap. One thing which had frequently struck him was that  
means of ventilation, which were amply sufficient, had been  
in many workrooms provided, but were not made use  
of, or only when the atmosphere became unbearable to some of  
the workers more sensitive than their neighbours. Whatever  
means were adopted they should be the simplest consistent with  
efficiency, and should be in charge of some responsible person,  
whose duty it should be to see that they were properly used.  
If a standard of air purity were prescribed and enforced,  
employers of labour would in self-protection see that the means  
of ventilation were regularly and properly used.

The president, Professor Glaister, said that in his experience  
the difficulty was not in the institution of measures of ventila-  
tion, but in seeing that they were carried out. It might be that  
in a particular workshop some employé who did not like what  
was called fresh air stopped the operation of the fan or plugged  
up the ventilating apparatus. The whole history of sanitary  
legislation in reference to the Factory and Workshop Acts had  
determined that they had got to protect the workman against  
himself. In the suggestion of a standard, four things were  
required—first, a minimum standard in terms of carbonic acid;  
second, that appropriate means of ventilation should be insti-  
tuted to keep to that minimum standard; third, that the owner  
or occupier of the workshop should be charged with the obli-  
gatory duty of seeing that the ventilation was carried out; and  
fourth, that the inspector of workshops should be compelled to  
test the air for analysis just as they took samples of adulterated  
goods.

Mr. J. H. Waterston, Edinburgh, read a paper on the  
Factory and Workshops Act, 1901, and its effect on local  
administration. He spoke of the undue complexity in the

TAYLOR'S PATENT JUNCTION "

No. 12662.

For WATER CLOSETS, WATER PIPES, ANTI-SYPHON PIPES, &c.

APPROVED BY ALL SANITARY AUTHORITIES.

Junction has been invented with a view to enable anyone fixing closets overcoming the difficulty of the  
any angles required for the various makes, also to avoid the necessity of having joints inside the walls, which  
dangerous and not allowed by County Councils, Borough Engineers, Architects, &c. The 4 inch Junction can  
be adapted to any size from 4 inch downwards. Any plumber will see at a glance the great convenience of this  
as it only requires one junction for the many shapes and sizes. No Brass Thimbles or Calking required.  
Hot Gas and Watertight Joint can be made in a few minutes by any ordinary Plumber. In fixing this Joint,  
it is necessary to cut the Lead Pipe to the required angle, place on the loose Iron Flange, then flange back  
the Pipe ½ inch all round, coat the face of Flange with a little Red Lead Putty, bring the two Faces together  
and screw up with the Bolts, screwing up each Bolt a little at a time until they are all tight, then the Joint is made  
and will stand any test. Another great convenience is:—In case of any alterations or renewal of Soil Pipes, all  
required where this Junction is used is to unbolt the same, and the Closet and Pipe leading to it are left  
untouched. With all other Junctions it is necessary to take down the W.C., break open the wall, damaging the Pro-  
perty and causing other inconvenience.

- A—Is the front view of Junction and loose flange; the inlet being elongated, allows the lead pipe to be cut  
to any required angle.
- B—Shows the Joint fixed and ready for tightening up, and also a few of the angles which can be got.
- C—Shows the one size which can be adapted for 4 in. Soil Pipe, and a 4 in. x 1½ in. Invert Junction for Anti-  
siphon Pipes, &c.
- D—Shows how to arrange for a small sized branch.

Made in Three Strengths—Ordinary Rain Water, ½ and ¼ Metal.

CHARLES TAYLOR, R.P., Sanitary Engineer, ECCLES, MANCHESTER.

wording of legal enactments and the urgency of simplification and directness. So far as factory and workshop legislation was concerned they had some relief in the consolidating and amending Act of 1901. He gave a description of the provisions of the Act. The crux of the Act would lie in its administration. In default of efficiency in that respect it would, as regards protection to the workers, be without practical result. Speaking of the dangers of official overlapping, he said that there was created a situation of some complexity. They had now and again painful examples of friction between public servants, who by giving rein to their professional jealousies, advertised their own incompetence and endangered the interests of those whom they were paid to serve. The time had come when public servants who were foolish enough to obtrude their little weaknesses to the detriment of the public service would either require to adopt a more sensible rôle or suffer official extinction.

Mr. George Smellie, convener of the public health committee, Partick, read a paper on the housing of the working classes. He said that municipalities, as opposed to private effort, had certain advantages. They borrowed at a lower rate of interest; could from time to time better invest returns, and so with the best result, accumulate sinking funds. They could erect and hold larger blocks, making it convenient and practicable to have resident caretakers, with resulting advantages of economy in upkeep, fewer bad debts, and a general maintenance of order and tidiness. On the other hand, the private trader had certain first cost advantages. He saved contractor's profit, saved an architect, measurer, inspector and general administration, saved on interest during construction by studying chance of securing tenants and by throwing energy into the completion of his work. The strong point in favour of municipal or company schemes lay in their making a resident caretaker possible and practicable. Any municipal building scheme must of necessity be so limited in its nature and involve so many questions in selection of tenants and in defining and limiting the class of individuals for whom houses were available, that it became impossible by municipal building methods to deal with the evils to such an extent that any practical advantage would be secured. Probably for a limited time municipalities by modifying rates on houses of not more than two sleeping apartments might induce the private builders to erect blocks with desirable sanitary surroundings to be ultimately acquired by companies and managed under resident caretakers. Ultimately, when the

practice had become more general, the investing public would take kindly to the resident caretaker, and smaller but more certain returns. Slums would then gradually disappear. Why should any municipality play into the hands of the enemy and acquire decaying property at an artificial and inflated value? Time would silently but steadily dispose of the present insanitary buildings. In all the circumstances it would probably be found that municipal building schemes would not do more than touch the hem of the garment, and, on the other hand, involve the municipalities in speculation and complications, the ultimate results of which were not readily foreseen, and at the same time interfere with the private builders who at present erected large numbers of workmen's dwelling-houses every year.

Mr. Peter Fyfe, Glasgow, stated that the Corporation of Glasgow did not profess to have seriously tackled the question of the housing of the poor. It was, however, their intention to do so now, and with that end in view they had purchased twenty or thirty acres in the east end of Glasgow. They had invited architects and builders to furnish plans, showing single apartment houses, with a rental not exceeding 5% per annum, two apartments not exceeding 8%, and three apartment houses not exceeding 13%. He maintained that the building of houses for the poor would be better done by municipalities, or by some other responsible body, who would appoint caretakers, than by private interest, because private interest could not possibly have interest for the public good.

Mr. J. H. Waterston drew a distinction between the inhabitants of the slums and the ordinary working man, who required nothing from either the Corporation or private builders but a fair field and no favour. The real solution of the problem was to have these houses built by the Corporation, who would put in a proper caretaker. He believed they could supply good sanitary houses at a lower rent than was being paid for slum property. The question would not be dealt with efficiently until the land question was put on a proper basis.

Dr. Barras maintained that municipalities could deal with the question better than private individuals, but he asked why should the municipalities be called upon to face such a problem when the truth was that an immense number of people would do nothing for themselves?

The President said that unless they defined their terms they would make no progress. No commission would be of any avail unless it defined at the very beginning who were to be the poor. Unless that was carefully done, they would get on to

of evidence which would be absolutely irrelevant in the solution of the problem.

On the motion of the President, seconded by Mr. Peter Tyfe, it was decided to continue the remit to the Council on the housing question, and to offer evidence to the Municipal Commission to meet in Glasgow on the same subject.

### SANITARY HOUSE DECORATION.\*

On commencing the sanitary decoration of a house begin at the top, in the loft if there is one, and work downwards, cleaning and removing dirt from all recesses and hidden corners as you go.

Such places are often overlooked and left as disease spots in a smart house. The loft especially receives the floating dust and impurities in the vitiated air arising from the lower parts of the house; therefore clean it out, remove all dirt, provide a skylight that can be opened and brush down and whiten every part of the walls, floor and under surface of roof, either with lime wash or carbolic distemper.

Do not leave the open joisting and rough plaster to accumulate more dirt, but put a thin flooring all over the loft, and thus gain useful storage room, which being lighted and ventilated will make the whole house healthier. Where air and sunlight enter microbes will be conspicuous by their absence. Sunlight is a great germ-killer, wherefore all dwelling-rooms should have ample windows.

Descending to the sleeping apartments, and having perhaps admired the beauties of the smart new decorations, let us peel off that little piece of loose paper on the wall. To our horror we find that the "decorator" has forgotten to strip the walls before repapering them, and here are five or six layers of dirty old paper and decayed paste, in all probability holding vermin or even the germs of disease, behind the newest paper.

Let it here be uncompromisingly stated that every scrap of old paper on walls or ceilings and all old distemper should be soaked, scraped and washed off to the bare plaster, except perhaps in the case of a tightly hung varnished or painted paper, which already presents a solid impervious surface. Insist, as one of the first principles of sanitary decoration, on the stripping of walls and ceilings, and disregard all pleas or fears as to fetching down the loose plaster. If the plastering

\* Abstract of paper by Mr. Louis Hanks read at the Sanitary Congress, Manchester.

is so weak that it is held up by the paper or old whitewash that is surely a pretty good indication that it needs repair.

The desirability of enforcing the stripping of old wall-paper and distemper by the passing of a by-law to that effect may be commended to the attention of sanitary authorities.

Always use some disinfectant in the water employed in stripping and washing down the interior of a house, both as a sweetener of the rooms and as a protection for the workmen in case there may have been infectious illness on the premises. Safe and effective liquid disinfectants are so cheap nowadays that there is no reason for omitting this simple precaution.

A solution of soda in warm water facilitates the removal of old paper and the effective cleansing of the surface.

Wherever there is a sign of dampness trace and remedy it at its source, to protect health and to prevent damage to the decorations.

In slight cases it may suffice to line the damp wall surface with lead foil or pitch-paper, or to paint it before repapering, but all serious dampness should be thoroughly removed.

Having stopped all cracks or imperfections in the plaster with Parian or Keene's cement and rubbed down the plaster to an even surface, the walls and ceilings are ready for decorative treatment, which must of course depend on individual taste and the finances at command.

In "clairecolling" or sizing walls or ceilings preparatory to papering, and also in the process of distemping, the smell of size is often very offensive, and this is not to be wondered at when its organic nature is considered.

This odour can be almost entirely neutralised by the addition of a gill of turpentine to a pailful of melted size or distemper. This is actually an improvement to the body and binding properties of the material as well as a deodorant.

In hanging papers, embossed pulp, or canvas materials on painted or varnished surfaces, a clairecolle of size and soda should be used—half a pound of soda to a gallon of melted size—to give a "bite" to the material to be hung and to prevent blistering. The clairecolle for unpainted surfaces should be melted size with a little whiting and turps as aforesaid, no water.

Many of the sanitary, washable distempers or water paints—so justly approved and largely employed nowadays—contain a percentage of turpentine, boiled oil, or other vehicles, as well as an admixture of dry white lead, zinc white or soluble glass, together with some disinfectant. Such truly sanitary pigments cannot be too highly commended, as they are cheap, produce

artistic and durable effects and possess better covering properties than oil paint. One hundredweight of such a distemper will cover 840 square yards, while the same quantity of oil paint will only do an average of 500 square yards.

Little need be said as to the composition or application of paint to walls or woodwork beyond urging the use of zinc white (oxide of zinc) or Charlton white, as being non-poisonous and therefore more sanitary than white lead (carbonate of lead), the poisonous nature of which is well known, although it may be safely used with proper precautions.

If white-lead paint is used it should be genuine old, ground white-lead, mixed with pure American turps and Baltic linseed oil, with the addition of litharge driers or terebene, according to the weather in which it is used; and such paint gives off little or no odour or volatile particles.

Do not use cheap white lead, as it is often adulterated with barytes (sulphate of barium), and avoid "young" or new lead as it is deficient in covering properties and damages colour in its oxidation. White paint is the most healthful of all paints, because, apart from its artistic effect, it shows dirt better than coloured paint, and thus indicates the necessity for cleaning. A glossy surface is more sanitary than a dull or "flatted" surface, as it affords less hold for dirt. In selecting papers or decorations for the walls of bedrooms, and indeed for all living rooms, avoid large, staring patterns and aggressive contrasts of primary colour in masses. The less pattern there is the better; a simple background of agreeable tone is more restful and suited to a bedroom than any assertive decorative treatment.

A room simply decorated with a pale cream (not blue-white) ceiling and cornice, cream enamelled woodwork, and papered, painted or distempered walls in a tint of soft non-arsenical green or blue for a warm, sunny aspect, or in warmer tones of terra-cotta, pink or yellow for cold, dark rooms, will be quieter and more soothing to the senses and thus more conducive to repose than more gaudy treatments.

In purchasing paperhangings take care to procure them from a firm of repute, who can furnish an authentic guarantee that no arsenical colours or other poisonous ingredients are employed in the process of manufacture.

The fermentation of the paste used in hanging papers and relief materials is a danger which can be avoided by the addition of a lump of alum, the size of a filbert, to a pail of paste.

This helps to thicken the paste, giving better and more adhesive body, as well as having a hardening and non-fermentive action.

The addition of a small quantity of oil of cloves also assists in checking fermentation.

Lastly, we have to consider the floor, which should be sized and varnished all over, merely having a loose rug, thus providing a thoroughly sanitary surface which can be kept clean and germ-free without the use of the scrubbing-brush. All open joints should be stopped to prevent dust dropping through into the space beneath. Permanganate of potash is an excellent dark stain for clean floor boards, and has the additional merit of its disinfecting qualities.

The same general principles apply also to the decorative treatment of the reception-rooms, staircase, &c., elaborated to whatever extent artistic inclinations or means may permit.

Paperhangings, where used, should be preferably those with a hard, smooth surface, such as the hot-pressed silk fibres or oil-printed papers, not flocks nor mica papers, which catch the dust, and whose particles become detached in course of time thus failing to comply with sanitary requirements.

Painted and panelled walls and ceilings, hand-painted decorations of flat ornament in monochrome, colour or stenciling, with the embellishment of gilding in mouldings and other ornamental details; plaster or compo-mounted enrichments, hardwood panelled wainscoting, parquet floors and every kind of decorative treatment that does not afford absorbent surfaces or dust-collecting ridges, shelves or scrolls, may be freely employed in an entirely sanitary scheme of decoration.

In bath-rooms and closets do not have wooden enclosures to baths, sinks or w.c.'s, as such places frequently serve to harbour filth and thus become a nuisance. Let every part of the sanitary fittings be open and above board, so that any leakage can be detected and every part accessible for daily cleansing.

Corners behind w.c.'s and corners of rooms generally would be more hygienic if slightly rounded to prevent the collection of dirt.

The walls of bath-rooms, lavatories and the domestic offices should be covered with varnished paper, paint or, preferably, with ceramic or enamelled metal tiling, so as to be impervious and washable. The latter forms of wall covering are strongly to be advocated for larders, pantries and store cupboards. The floors of bath-rooms, water-closets and lavatories, also larders, should be cemented or asphalted.

Mosaic of marble or glass is a material more often employed for the flooring of halls, steps and lavatories in this country than for mural decorations, due chiefly to questions of cost, but

It is a matter for regret that this sanitary, artistic and durable material is not more largely used for decorative purposes.

In conclusion, a word may be given to the necessity for ample inlet and outlet ventilation for every room, to promote the health of the occupants and to preserve the decorative ornaments. The least injurious form of artificial lighting in all respects is, of course, the incandescent electric lamp, and where gas is used every burner should have outlet ventilation to carry off the fumes.

Carefully search for cupboards under stairs, also cellars or vaults. See that all such places have cement floors. Lime-wash them twice a year, and do not let lumber and dirt accumulate. Abolish brick or wood dustbins, and have iron portable bins.

Bear in mind that soap and water, fresh air, sunlight and cleanliness in general are as much to do with health as elaborate drainage and the complications of modern plumbing, and there is the advantage, moreover, that such simple things are within the reach of all—the poor as well as the rich.

This rough sketch of a few points in the sanitary decoration and management of houses, while necessarily superficial, will have served its purpose if it provides material for discussion.

### RED LEAD AND LINSEED OIL.

A SPECIAL event has led me to consider, says Monsieur Vaillant in *L'Architecture*, the reasons which in former days led to the use of red lead, and lately of colcothar (improperly called minium of iron) for protecting iron from rusting. This protection of the metal from the effects of damp and acids has always been a subject of great interest for builders, but for all that I have found no trace of works showing any sign of that interest, and builders appear to me to have been content with the old traditions of the utility of red lead.

Our colleagues in the North of France think that it is unnecessary to paint iron which is shut up in masonry and sheltered from the weather, but others think that it cannot be regarded as being protected from damp even under those circumstances, and that it should therefore be always painted with red lead.

There is no process which gives complete security from the weather to ironwork exposed in the open air. If they are oil painted, the painting has to be renewed and renewed until all details are smothered. Enamel scales off. Browning only acts as a very temporary preservative. Horn used hot with oil

is still the best, but I have been unable to obtain any information about this singular process.

It is said that red lead and linseed oil form, in marked contrast to colcothar, asphalt or coal tar, a composition which adheres very tightly to iron and has no action on it. The red-lead coat does not crack in drying or after drying. It does not blister or flake off. When the painting has to be renewed it is not necessary to remove the old colour, and the other applications have to be scraped off, so that the new coat of asphalt, &c., can be put on a clean metallic surface.

The qualities essential for a protective coating for iron are impermeability, adherence and elasticity. It must respond without rupture to the expansion and contraction of the surface which it covers. The red-lead coating being a bad conductor of heat lessens these variations, so less call is made than would otherwise be the case on its elasticity.

Red lead is applied to ships' bottoms in the following manner:—The iron is first made clean with hydrochloric acid and the vigorous use of rotary wire brushes. It is then rinsed with water and rubbed dry. It is then painted with the red lead and oil, which is first made into a thick viscid paste, which will keep several days without hardening. Just before use this paste is thinned with oil till it can be conveniently applied with the brush. Twenty-two gallons of colour contain one cwt. of linseed oil and 400 lbs. of red lead, and will cover 120 square yards for the first coat and 144 for the second.

The proper preparation of the surface to be protected is of the first importance, while the other essential is that the composition should be good. Now builders pay attention to neither of these points. They clean the iron perfunctorily, or, which is just as useful, they don't clean it at all, and they paint it with inferior qualities of red lead, often adulterated with ochre or even with brickdust. Such alteration will remain undissolved if the suspected pigment is boiled in a solution of sugar acidulated with nitric acid, which dissolves minium rapidly.

Iron forged at an engineer's and brought to a building is left about in all sorts of weathers, and as above stated is imperfectly cleaned or not cleaned at all, and then painted with inferior red lead. Besides, careless work leaves joints insufficiently protected by the paint, and as soon as rust gets hold in a joint the work is as good as ruined, as much ironwork on outdoor carpentry testifies.

Although it must have been evident from the beginning of the use of iron its tendency to rust was its great drawback, no

success seems to have been achieved in its protection until the revival of oil-painting by Van Eyck, and the discovery that linseed oil had the power of drying in the air and covering surfaces with an impermeable coating. At a time when every painter prepared his own colours and made all manner of experiments, it was quite natural that the increased drying power conferred on linseed oil should have been found out. No doubt the early attempts to prevent iron from rusting were confined to greasing it, and once the effect of lead on linseed oil had been observed it was not a great step to paint iron with red lead and oil. But so far as I know no systematic attempts have ever been made to establish clearly the conditions of painting iron with red lead and oil to compare its results with those of the anti-rust methods. Cloez did something towards it when he showed that the drying of oil was due to absorption of oxygen, and the influence of light, heat and extent of surface on that absorption. There is very little oxidation of an oil by the air in the dark, and less with coloured light than with daylight, and less at low than at high temperatures. The special capacity of linseed oil in painting has thus been defined, but it is very doubtful whether that can be said of the bodies which are mixed with it, and which seem merely to give opacity and consistency.

It is unfortunate that the great difference in price among oils and the great difficulties in the way of recognising them when mixed together are the cause of much adulteration. Chemists have long been trying to find out means of satisfactorily analysing mixtures of oils, and it cannot yet be said that they have been entirely successful. The difficulty lies in the close similarity between the composition of different oils, and in the fact that tests which give a sharp reaction with a pure oil do not do so in mixtures containing it.

Hence the exaggerated demand for special siccatives. Some there are of these which can be of service when used with prudence and with reference to some particular object to be attained, but unless used in very small quantities they lessen the adhesion of the paint, and create a tendency in it to scale off, by making it less elastic and hence less conformable to the effects of changes of temperature upon the metal.

Insufficient cleaning of the surfaces to be painted, and the use of other applications than red lead and linseed oil are probably between them responsible for most of the failures experienced in iron painting. However that may be, there can be no doubt that red lead and linseed form a very suitable composition for protecting iron. Recent researches tend to show

that an actual compound of linseed oil and a minium, a so of lead-soap resembling india-rubber, is formed. These researches also controvert a curious objection which has been made to painting iron with red lead. It has been said that the painted iron suffers by reason of a galvanic action being set up between the iron and the minium. It is singular that no one has ever advanced this objection to the painting of iron with white lead and linseed oil, an application which is exactly on all fours with the composition of red lead and linseed oil. Objectors to red lead and not to white lead also seem to have forgotten that the oil, especially when dry, is so bad a conductor the passage of any current seems absolutely impossible. At Bremen an iron coated with red lead eighteen years before was found to be absolutely insulated, so that it did not affect a galvanometer with tensions of 150 volts. In fact, the director of telegraphs at Hanover was led to suppose that even atmospheric tensions might be resisted by a mixture of red lead and linseed oil.

A paste of red lead and linseed oil is the only substance capable of closing hermetically joints subjected to great pressure from gases or water, and it is used in the manufacture of secondary batteries to protect metals from oxidation. The experiments of Hacketal have shown that a paste of linseed oil and red lead applied to vegetable fibre provides a solid insulating, weather-resisting envelope, capable of replacing gutta-percha for overhead wires. The resistance of the dry mass is more than 640,000 megohms per square inch. The tissue impregnated with linseed oil pasted with from four to five times its weight of red lead loses completely its hygroscopic properties and becomes an insulator equal to india-rubber. It is insensible to all kinds of weather.

Two threads of bronze, each one-twentieth of an inch in diameter, were exposed to chlorine gas for a month, one naked, the other painted with red lead and linseed oil. The latter was not in the least affected, and the other was eaten completely through.

The present agitation against the use of lead in any form, from its poisonous effects on the workmen using it, is taking a wrong form. The right course is not to prohibit the use of lead and its compounds, which have valuable properties probably impossible to secure with any substitutes, but to find out and adopt methods whereby they may be used without injuring the health of those who have to handle them. Such must exist, and up to the present very little attempt has been made to find them.

# The Architect.

## THE WEEK.

WE have already chronicled the death of EMERICH STEINDL on the 31st ult. in his sixty-third year. He was the architect of the Parliament house in Buda Pesth, which will shortly be opened. In Hungary there was a movement among many enthusiastic artists for the creation of a national style, and the examples produced were more remarkable for novelty than for grace. STEINDL stood aloof, for he had been nurtured in the Classic traditions, and he preferred in Gothic the works of the purest period alone. He was largely employed in the restoration of Mediæval edifices, such as the beautiful cathedral of Kaschau, the Abbey of Jak, the castles of Vajda-Hungad and churches in Bartfeld and Kremnitz. The Emperor of GERMANY was especially pleased with STEINDL'S Houses of Parliament. While allowing the two chambers to be expressed, the architect suggested their unity by means of a great cupola.

THE export of works of art from Rome is steadily decreasing. The value of the paintings, statuary and miscellaneous works which left the city last year amounted to 83,946*l*. In 1898 such exports were 116,930*l*; in 1899 there was a reduction to 113,115*l*, and in 1900 to 103,483*l*. It will thus be seen that last year the value was not quite three-fourths of the total four years ago. According to the British Consul the falling off is probably due to two causes: the first is the strict enforcement of the rules bearing upon the transfer from the country of works of art, chiefly specimens of old art; and the second is the tendency on the part of the present generation to follow commercial pursuits as yielding more tangible and early profits than an artistic career. An influential cause arises from the more accurate knowledge of works of art which is prevalent among visitors to Rome. There was a time when there was no difficulty in passing off sham antiques on strangers, but people have now become more sceptical. The works of modern Roman artists are also less appreciated than formerly.

A PAPER on "The Lia Fail, or Stone of Destiny at Tara, and the Election of Kings by Augury," was read by Mr. SIDNEY HARTLAND at the meeting of the British Association. This is by some supposed to be the Coronation-stone in Westminster Abbey. Mr. HARTLAND said it had an authentic history of 600 years. At the time of the conquest of Scotland by EDWARD I. it was the stone on which the kings of the Scots were according to immemorial custom installed, and was then removed from Scone to Westminster Abbey. Its earlier history was abundantly supplied by legend. Regarded as sacred, it was even identified with the stone used by JACOB as a pillow. The attempt was thus made, by connecting the ruling race in Scotland with the legends of the Hebrew patriarchs, to confer upon the stone the united sanctity of religion, antiquity and patriotism. The history of the stone had been subjected by SKENE, and more recently by Mr. O'REILLY, to an exhaustive analysis, which rendered it clear that there was no trustworthy evidence that the Stone of Tara was the Coronation-stone now at Westminster. The antecedent improbability was great, and even if it were indisputable that the stone in question was no longer at Tara in the eleventh century, the chasm between that period and FERGUS, whose very existence was legendary, would still have to be bridged and the variants of the story would need to be reconciled.

It is a popular belief that parsonage houses are as much the property of the parish as the church itself. Surprise and alarm were therefore excited by the announcement that the Vicarage House and 8½ acres of glebe land at Cowfold were about to be sold by public auction. A few years ago a similar attempt was made, but the then Bishop of CHICHESTER, at the request of the Commissioners, refused his consent. The present bishop with the patron of the living, the Bishop of LONDON, and the Archbishop of CANTERBURY gave their permission. A memorial was

accordingly sent to the prelates by the parishioners asking that the sale should be prevented. The explanation of the vicar was that it was impossible for a clergyman whose income was only 330*l*. a year, and who was not provided with a curate, to keep up a fine mansion with five acres of pleasure grounds, orchards and gardens. The vicar denied that the late bishop was opposed to the sale. The vicar also wished to erect a house that would be better adapted for a man with a limited income. But the parishioners consider that a cheap house built near the entrance gate will not only depreciate the value of the present vicarage, but will be so wanting in privacy that the living will be deprived of one of its great charms. The vicar's reply was that the new building will be erected under the rules of the Ecclesiastical Commissioners at a cost of 1,500*l*, and the plans will require the sanction of the three bishops. According to the solicitor of the vicar, the inhabitants of a parish have nothing whatever to do with the residence of an incumbent. It is not their property, never was their property, nor have they contributed in any shape or form one single farthing to its erection. In days gone by pious persons built churches and parsonages on their own land, dedicated them to pious uses, and endowed them with land, tithes, &c. They thus became the property of the Church, and each of the holders of the benefices thus created became the freeholder of the church, parsonage house, glebe lands, &c., during his incumbency. The parsonage house provided a roof over his head, and the glebe lands and other emoluments provided for the necessities of his maintenance and that of his family. Of late years the old parsonage houses, many of which had become dilapidated or were far too small for the requirements of modern times, were rebuilt under the auspices of Queen ANNE'S Bounty, which lends money under certain enabling statutes to incumbents for the purpose of rebuilding their parsonage houses. In spite of the opposition the sale took place on Monday last, the freehold of the vicarage, with stabling, finely timbered gardens and grounds, ornamental water stocked with fish, and a piece of meadow land of about 8 acres 2 roods 36 poles being sold for 4,000*l*.

THE executive committee of the Carnegie Trust propose to expend 200,000*l*. among the four universities of Scotland within the next five years. The money will be available for improvements in teaching and for new buildings. A sum of 40,000*l*. will be allotted to Glasgow for buildings which will be utilised for the departments of physics, physiology, forensic medicine and materia medica. To Aberdeen University 5,000*l*. will be allotted, mainly for laboratories. A similar sum is to be given to St. Andrews University. With contributions from other individuals the funds available for building purposes at St. Andrews reach a sum of over 40,000*l*. It is hoped to provide better accommodation in Edinburgh University for the classes of natural philosophy and engineering. The Trust will contribute 40,000*l*. towards the expense on the understanding that the plan is approved. A charter has been granted under the Royal Sign Manual for the incorporation of the Carnegie Trust.

IT was said by HEINRICH HEINE that in listening to CHOPIN'S compositions he forgot the performer, and thought only of the great tone-poet whose place was with MOZART, BEETHOVEN or ROSSINI. CHOPIN made himself so much at home in Paris, he might with reason be looked upon as a Frenchman. But the French no longer care about him or his romantic career. A few years ago some of his surviving admirers resolved to erect a memorial of him, and a site was assigned in the Parc Monceau, Paris. That would be an appropriate position for a celebrity who was once much appreciated by the fashionable world. Then there was a change in the official mind, and the Luxembourg Garden was substituted. It was also decided to allow no more than a bust, accompanied by a single figure. Vandalism has, unhappily, made its appearance in Paris, where the simplest work of art used to be respected, and the emblematic figure has already suffered mutilation. The sculptor, M. GEORGES DUBOIS, is afraid of a renewal of the attempts, and he therefore proposes that the figure should be cast in bronze. The expense would not reach 100*l*.

PAINTERS' ARCHITECTURE: CLAUDE.

### SCULPTORS AND PAINTERS.

IT is impossible to prevent men from exercising their self-esteem, and consequently the society, profession or calling to which some belong is extolled beyond those in which they have no part or interest. In that way the purpose of nature is served and there is progress. Even in the serene atmosphere of the British Association we find the same spirit existing. Rarely are philosophers allowed to imitate BACON in taking all knowledge for their province. They have to make their choice. The public also copy the specialists. Some sections are crowded, whilst in others the readers of papers have only a few men like themselves as listeners, and indeed in occasional cases the papers have to be taken as read.

The pursuers of science are, however, only imitating the conduct of painters and sculptors in the palmy days of the Renaissance. One of the subjects which was most fiercely disputed, and very often with swords and daggers as arguments, was the relative importance of the man who worked in marble, bronze or precious metals and the man who covered canvases with colours. It is recorded of GIORGIONE that he upheld the supremacy of his own art by insisting that a spectator without changing his point of view could see a painted figure under several aspects and even with different movements. That was a commonplace theory which might be convincing to people who had only a vague notion of art and wished to have its principles reduced to a few words. But when GIORGIONE was asked to give a demonstration of his assertion he went through one of those curious experiments which were frequent at the time, but which would not now convince children who had perused a few pages of a scientific primer. VASARI relates how GIORGIONE painted a man whose back was visible in the picture. Before him was introduced very clear water, which displayed the front part of the figure. On one side was a polished cuirass, and on the other a mirror, and the reflections were supposed to reveal the remainder of the body. The biographer tells us that the work received unlimited applause on account of its ingenuity, and it was accepted as establishing the superiority of painting over sculpture in having the power to combine in one view a great many aspects.

The sculptors, on the other hand, claimed their own superiority because it was necessary to be thorough in their work. They were not able to evade a contest with difficulties by means of shadows, foreshortening, perspective tricks, &c. Their statues were to be seen from many points of view, and were equal to sustain the test of touching. Even in reliefs it was sometimes expected that the figures were to be made so salient as almost to suggest they could be detached from the ground.

When it was a question whether painting or sculpture was most eligible for the decoration of a building, we can

well imagine that arguments of many kinds, and not always cogent, were forthcoming from the representatives of the two arts. The painters were willing to adorn the exterior of structures with frescoes regardless of atmospheric operations, while the sculptors believed the interiors to be adapted for statues and reliefs. In our time a competition of the sort is almost an impossibility. Buildings rarely are allowed to afford opportunities to painters or sculptors for the exercise of their arts. But it is noteworthy that in 1780, when the Royal Academy was still in a state of infancy—it was only ten years old—REYNOLDS felt it was his duty to discriminate between the principles of painting and sculpture and to demonstrate that sculpture has but one style, while there were several in painting. "The sculptor's art," said the President, "is not unlike that of dancing, where the attention of the spectator is principally engaged by the attitude and action of the performer, and it is there he must look for whatever expression that art is capable of exhibiting." REYNOLDS was not a scholar, but it is a remarkable fact that PLUTARCH made a nearly similar observation, the difference being that he refers to poetry instead of sculpture. SIMONIDES had said, and his words helped to inspire the *Laocoon* of LESSING, that painting was dumb or silent poetry, for in the old days poetry was more often listened to in the form of recitation than read. PLUTARCH, on the contrary, held it would be truer to say that dancing was mute poetry, and poetry a speaking dance, inasmuch as painting never employed the aid of poetry, or poetry that of painting, whilst dancing and poetry have a complete affinity. Painting, sculpture and dancing were consequently brought into relation. It would, however, be well to remember that dancing was a very different art with the Greeks to that which was popular in London during the eighteenth century. THACKERAY in one of his essays introduces REYNOLDS and GOLDSMITH at Madame CORNELYS', the former wearing a domino. REYNOLDS stated that dancers can wear masks with little diminution in expression, and he expressed a belief that in antiquity masks were also common. Hence he drew the conclusion that as the face bears so very inconsiderable a proportion to the effect of the whole figure, the ancient sculptors neglected to animate the features with the general expression of the passions. It was with the face rather than with the figure that REYNOLDS was successful, and thus his own practice was judged by him to represent exactly the province of painting and at the same time to define the limits between painting and sculpture. If it were pointed out to him that his figures did not suggest a study of the model or of ancient masterpieces in sculpture, he would have been able to reply that the figures of TITIAN and of RUBENS were attractive although they were not perfect in their proportions.

The Venetian and Flemish painters offered compensa-

tion for inaccuracies by the vivid power of their colours. A sculptor has no resource of that sort; if his contours are excessive or attenuated he must accept the consequences. No friendly apologists extol the glowing flesh or the richness of his costumes. He is treated as if he were a boy at school whose inaccuracies in arithmetic, grammar or geography are followed by punishment. There is no middle course for the sculptor; he must attain the standard which is accepted as the right one or his work will fail. It is also his misfortune, a circumstance ignored by the public, that with him the correction of faults is attended with such difficulties as to be almost an impossibility. A painter can change or modify his work to any extent that seems desirable, but there is not a process corresponding to painting out in marble. The clay model can certainly be altered, but an error in marble may be of a kind beyond remedy. In fact, an attempt at correction is not infrequently found to create a defect of a worse character.

When all this is called to mind it becomes an excuse for the utilisation of mechanical aids in sculpture. With a full-size model which is as complete and perfect as the artist can make it, an exact reproduction, which can be performed by assistants, not only diminishes risks costly to the sculptor and which he can ill-afford, but it may produce the most pleasing result. The cause of some of the disappointment which now arises on viewing works by JOHN FLAXMAN was his employment during the greater part of his career of models which were far smaller in size than the figures in marble. Dexterous as he was as an operator, he was not always capable of realising his original idea. Italian practice did not depend much on large models, and the sculptors were trained from entering the ateliers to carve the stone. But the number of unfinished works by MICHEL ANGELO will suggest that his powerful arm could not always make the marble express his thoughts.

The want of appreciation of the sculptor's art in England arises in a large measure from the difficulty which the public in general have in judging it rightly. They have become tolerably familiar with painting, and they have a notion that the dividing line between painting and sculpture is not so wide as theorists assert. Hence it is that sculptured tricks when displayed in foreign exhibitions, and which make the judicious grieve, are usually attractive for English visitors. In one sense it is true, as was remarked by Sir DAVID WILKIE, that in ancient art qualities exist of freedom of handling and light and shadow which become suggestive of great paintings. WILKIE accounted for this by saying that in the time of the Greeks statues and bas-reliefs were painted or produced in parti-coloured marble, while the pictures resembled coloured sculptures. But some modern efforts to combine the qualities of the two arts are pushed to extremes which would daunt a Greek. No one can properly judge sculpture who is not possessed of a canon of proportion more definite than that commonly employed in the judging of pictures. Indeed in assessing the value of pictures proportions are hardly recognised, or the defects are condoned by qualities which are more pleasing to the crowd.

The difficulty of criticism as applied to sculpture is of old standing. VITRUVIUS considered that the fluting of columns was no more than an attempt to imitate the drapery of the figures of women as represented in sculpture. It is only necessary to give a glance at the procession of the Athenian maidens which we see in the British Museum in order to realise how inadequate was the suggestion. We need not say anything about the want of artistic imagination which is imputed to the old architects, and their inability to produce effects of light and shade and variety of surface by channelling their columns. What is also suggested is that there was monotony in the folds of the garments; but it will be found that while there is a resemblance in the costume, for no doubt the Athenian girls who formed the procession were uniformly clad, yet we can see sufficient variety to confute the statement of VITRUVIUS.

Efforts are occasionally made of late to overcome an English peculiarity of long standing, and to have the grace which sculpture confers imparted to English buildings. But that end will not be attained if the works which are sought after do not possess the characteristics of genuine sculpture. Public bodies and private building-owners, as well as those who pass by and utter critical opinions with

the assurance of ignorance, must not allow themselves to be led away by a weakness for painting. Each art has its limits, and neither will be helped if the qualities are mixed and confounded. VASARI in his time endeavoured in the introduction to the "Lives" to persuade his countrymen that the old contest as to whether sculpture or painting was entitled to first place was labour in vain. A similar appeal is still more needed to-day in England. Sculpture cannot succeed if an untaught public opinion decides that the sculptor must do his best to make his work resemble the works of the painter, and possess those qualities which the material he uses is unfitted to express.

## THE EDUCATION OF CONSTRUCTORS.

THE importance assigned to education and to new subjects of study at the meeting of the British Association in Belfast must strike many of the old members with amazement. When BREWSTER projected the Association his desire was to have annual assemblies in which students of science could reveal their discoveries and obtain the applause they merited. The humblest explorer of nature in that way found an opportunity to exhibit the results of his investigations in the by-paths of science and to receive encouragement from those who were recognised as masters. At the early meetings of the Association many instances were forthcoming of men without renown who had succeeded in the ascertaining of facts relating to one kind of plants or rocks which hitherto were unknown or doubtful. They represented mainly sciences which were dependent on observation, and they were able to continue in the pursuit of their studies by the aid of small grants from the general fund. There were other men who were engaged in experimental science, and from time to time they imparted the results of long, costly and toilsome inquiries. That was only one side of the Association's utility. What was reckoned by many as more important was the facility which the meetings offered of bringing men together who lived in seclusion or far apart, and who could compare notes about the work in which they were engaged and give encouragement to one another. There could be no public record of what took place at conversations in which, perhaps, not more than two might join. But they may have been more productive of good than the open meetings of the Association.

As time went on the province of the Association was enlarged by the addition of new sections. It became necessary to play, as it were, to the public, and in that way the intercourse between devotees of the same pursuit was weakened. Many other changes have occurred, and it would now appear from what was said in Belfast as if prominent members were looking forward to a day when a different class of followers of science would take part in the proceedings.

Events have recently made this imperative. Although the British Association has accomplished so much it is evident that the progress of science has more advanced in countries where a similar itinerant institution is unknown. To a great extent the meetings gradually were taken to be occasions for pleasant excursions, and a week with the Association was judged by many to be the most interesting part of a holiday. Hence science was easily associated with pastimes, and men and women enjoyed themselves with playing with tremendous problems which, however vast in their conclusions, did not need much labour in obtaining information. JOHN TYNDALL spoke at a former meeting in Belfast about the scientific use of the imagination, but that power was long exercised by people who had never attended a lecture at the Royal Institution or read through a book on science. It was very agreeable to discuss problems in geology or evolution which could do without the support of evidence, but that mode of pursuing science was not adapted for business purposes in this world. A few years ago a German chemist apologised before the Association for the imperfections of the paper he was about to read, and which was on green dyes. He said it represented the work of only thirty years, and that time was insufficient to exhaust so important a subject. His words were no doubt regarded as mere affectation, but they suggested the thoroughness of German chemists, which has made them

supreme in chemical manufactures. Toying with science is not more in favour in Germany than toying with war. There is no difference in the grim earnestness with which both are followed.

We need not consider what was said about the necessity of a new mode of education and inquiry in the majority of the sections at Belfast. Anthropology has of late years pushed geology aside as the favourite science of amateurs. Yet we find the President speaking of the lamentable lack of precise information and of the generalisations resting on foundations which are so slight as to afford little chance of permanence. But the address to the engineering section by Professor JOHN PERRY should not be overlooked in the briefest review of the proceedings. Every man who is successful naturally thinks his own methods of education are the best. Professor PERRY served four years as an apprentice in a Belfast foundry, and he is therefore justified in concluding that manual work should be taken up at a very early stage by whoever aspires to become an engineer. In 1863 there was, he says, only one school in the North of Ireland, where practical geometry and mechanical drawing were taught. He also attended Queen's College, Belfast, for a course of civil engineering, and he supposes that never on earth was there a college so ill-equipped for such a study. The only apparatus consisted of a few surveying instruments. But he had for master JAMES THOMSON, the elder brother of Lord KELVIN, who was a great mathematician, and on that account he was not duly esteemed by the civil engineers of those days, or by railway companies, and we doubt if a structure from his design exists in Ireland. He was also a close observer of phenomena, and was therefore indisposed to accept the calculations which were then respected as infallible :—

One of his early lectures, says Professor Perry, was about flowing water, and he told us of a lot of things he had observed, which I also had observed without much thought, and he showed how these simple observations completely destroyed the value of everything printed in every text-book on the subject of water flowing over gauge notches, even in the otherwise very perfect Rankine. I felt how stupid I had been in not having drawn these conclusions myself, but in truth till then I had never ventured for a moment to criticise anything in a book. I have been a cautious critic of all statements in text-books ever since. Again, soon afterwards, he let me see that although I had often looked at the whirlpool in a basin of water when the central bottom hole is open, and although I had read Edgar Allan Poe's mythical description of the Maelstrom, I had been very much too careless in my observation. Among other things, Thomson had observed that particles of sand gradually passed along the bottom towards the hole. When he found out the cause of this it led him at once to several discoveries of great importance. Indeed, the study of this simple observation gave rise to all his work on (1) What occurs at bends of pipes and channels, and why rivers in alluvial plains bend more and more; (2) The explanation of the curious phenomena that accompany great forest fires; (3) The complete theory of the great wind circulation of the earth, published in its final form as the Bakerian Lecture of the Royal Society in 1892.

JAMES THOMSON revived Mediæval days, when professors influenced a large number of students with little external aid, for ability can dispense with costly apparatus of most kinds. But Professor PERRY was then sufficiently competent to take advantage of what he heard. He believes that with such a teacher boys from public schools like those who now join engineering classes would be handicapped, and they would gain more by entering works at once than by entering a great engineering school. "Our school system," he affirms, "resembles the ordinary type of old-established works, where gradual accretion has produced a higgledy-piggledy set of shops which one looks at with stupefaction, for it is impossible to get business done in them well and promptly, and yet it seems impossible to start a reform anywhere. What is wanted is an earthquake or a fire—a good fire—to destroy the whole works and enable the business to be reconstructed on a consistent and simple plan. And for much the same reason our whole public school system ought to be 'scrapped'."

The principle which was adopted by Professor PERRY with his colleagues, Professors AYRTON and ARMSTRONG, at the Finsbury Technical College, was that the teacher should take the pupil's point of view rather than the pupil the

teacher's, and that the student should be instructed how to teach himself rather than be taught by them. Their students are now to be found everywhere in good posts. Boys were instructed to make drawings in pencil only, also tracings and blue prints such as would be respected in the workshop, and not the drawing-class drawings which are respected nowhere. The spirit of the system was suggested by the rejection of a 100-ton testing machine, for it was thought preferable to improvise means of testing by an old screw-jack or a lifting machine, or by loading wires and twisting things. Four directors of electric companies entered into the spirit of the institution, and for many weeks occupied themselves advantageously in conducting experiments made with an old fly-wheel bought at a rag-and-bone shop.

It would seem as if Mr. SQUEERS had hit upon the sort of teaching which is best adapted for those who have to construct railways, machines or buildings. The pupil of Dotheboys Hall first went through an orthographical exercise by spelling "winder," and then was sent to clean one. Language and practice were thus combined. The majority of teachers until recent times were like pupils who knew only of "winders" from the spelling-book, and to this day a great many learned professors would be unable to describe the anatomy of one of the windows in their study. The knowledge required in practice is not of the kind that will be produced by definitions alone. Many pupils in architects and engineers' offices become quickly disgusted when they realise that words have meanings which are unknown to them, and which only can be discovered by an examination of the objects which are referred to. The national *mauvais honte* deters them from asking explanations, and they continue to go through routine in a manner that is unsatisfactory to themselves if they are honest, but which they have not the courage to remove. One sometimes thinks that in such cases it would be an advantage if words were not used until clear ideas of things were obtained by means of the senses. Every subject ought to be taught, Professor PERRY declares, "through illustrations from the professional work in which a student is to be engaged. An engineer has been wasting his time if he is able to answer the questions of an ordinary examination paper in chemistry or pure mathematics. The usual mathematical teacher thinks most of those very parts of mathematics which to an ordinary man who wants to use mathematics are quite valueless, and those parts which would be altogether useful and easy enough to understand he never reaches; and so it is also in chemistry. An engineer teaching mathematics would avoid all futilities; he would base his reasoning on that experimental knowledge already possessed by a student. He would know that the finished engineer cannot hope to remember anything except a few general principles, but that he ought to be able to apply these, clumsily or not, to the solution of any problem whatsoever."

It must have been startling for those who are conversant with the history of the British Association to hear those revolutionary methods announced. All branches of science are supposed to be represented in the sections, and anyone who is accepted as a genuine student should be able to take part in each of them without trouble. But Admirable CRICHTONS, however useful in conversation, do not aid in the practical work of the world. To master any one subject properly, if it were only green dyes, requires the devotion of a lifetime. With concentration and a good method a zealous student can, however, render himself capable of becoming useful to his generation. Nor is it necessary for him to conduct elaborate experiments or to employ costly testing machinery if he can fully understand that nature is uniform, and that small things rarely differ from those which are large. Sir JOHN HERSCHEL was of opinion that a lover of science could discover much in a common soap-bubble, and would be usefully employed in endeavouring to produce them on a large scale. What is true of the bubble is applicable to much else in science. But the experiments must have another object than the gaining of a little reputation by talking about them.

Two Bursaries and three demi-bursaries will be competed for on the 27th inst. at the Paris School of Electricity.

## THE EDUCATION OF THE ENGINEER.\*

Not only do I think that every teacher in an engineering college ought to have some acquaintance with engineering, but it seems to me equally important to allow a professor of engineering, who ought, above all things, to be a practical engineer, to keep in touch with his profession. A man who is competing with other engineers in practical work very quickly becomes antiquated in his knowledge; the designing work in his drawing office is altogether out of date; he lectures about old difficulties which are troubles no longer; his pupils have no enthusiasm in their work because it is merely academic lifeless; even when he is a man distinguished for important work in the past his students have that kind of disrespect for teaching which makes it useless to them. If there is fear that too much well-paid professional work will prevent efficiency in teaching there is no great difficulty in applying a remedy. One most important fact to be borne in mind is that efficient teachers cannot be obtained at such poor salaries as are now given. An efficient labourer is worthy of his hire; an inefficient labourer is not worthy of any hire, however small. Again, there is a necessity for three times as many teachers as are usually provided in England. The average man is in future to be really educated. This means very much more personal attention, and from thoughtful teachers. Is England prepared to face the problem of technical education in the only way which can lead to success, prepared to pay a proper price for real articles? If not she must be prepared to see the average man remaining uneducated.

Advocacy of teaching of the kind that was given at Finsbury has met by the opposition not only of pure mathematicians and academic teachers, but I am sorry to say also of engineers. The average engineer not merely looks askance at, he is really opposed to, the college training of engineers, and I think, on the whole, that he has much justification for his views. University degrees in engineering science are often conferred on students who follow an academic course, in which they know little except how to pass examinations. The graduate of university, even, does not often possess the three powers to which I have referred. He is not fond of reading, and therefore he has no imagination, and the idea of an engineer without imagination is as absurd as Teufelsdröck's notion of a cast-iron man. He cannot really compute, in spite of all his mathematics, and he is absurdly innocent of the methods of the true engineering of nature. This kind of labelled scientific engineer is now manufactured in bulk because there is a money value attached to a degree. He is not an engineer in any sense of the word, and does not care for engineering, but he sometimes gets employment in technical colleges. He is said to be a good teacher when he is really only impressing upon deluded pupils the importance of formulæ, and that whatever is printed in a book must be true. The real young engineer, caught in this net, will no doubt find his way out of it, for the healthy influence of the workshop will bring back his common sense. The average pupil of such graduates there is no help. If he enters works, he knows but little more than if he had gone straight from school. He is still without the three qualifications which are absolutely necessary for a young engineer. He is certain to be a nuisance in the works and to try another profession at the end of his pupilage. But if it is his father's wish he can make a show of knowing something about it, and he is usually called an engineer.

Standardisation in an industry usually means easier and better manufacture, and a certain amount of it may be good even in engineering; but when we see a great deal of it we know that in that industry the true engineer is disliked. Consider that in the scholastic industry there has been far too much standardisation. Gymnasium and polytechnic systems have been standardised in Germany, and there is a tendency to import them into England; but in my opinion we are very far indeed from knowing any system which deserves to be standardised, the worst we can copy is what we find now in Germany and Switzerland. What we must strive for is the discovery of a system suiting the British boy and man. The English boy may be called stupid so often that he actually believes himself to be stupid; but of one thing we may be sure, I find in some way or other an escape from the stupefying effect of schoolwork to which the German boy submits. And if it is possible to make the average English boy of nineteen such a silly school-leaving examination as the German would be little employment among common sense engineers for such a manufactured article. But is it possible that British boys could be manufactured into such academic machines, without initiative or invention or originality, by teachers who are none of them engineers? We must have a British system of education. We cannot do much longer as we have done in the past without engineering education, and, furthermore, it must be such as to

from the address of Professor John Perry, president of the Engineering Section of the British Association meeting at Belfast.

commend itself to employers. Of my Finsbury students I think I may say that not one failed to get into works on a two or three years' engagement, receiving some very small wage from the beginning and without paying a premium. To obtain such employment was obviously one test of fitness to be an engineer, because experienced men thought it impossible. One test of the system was the greater ease with which new men obtained employment in shops which had already taken some of our students. It is certainly very difficult to convince an employer that a college man will not be a nuisance in the shops. In Germany and France, and to a less extent in America, there is among employers a belief in the value of technical education. In England there is still complete unbelief. I have known the subscribers of money to a large technical college in England (the members of its governing board) to laugh, all of them, at the idea that the college could be of any possible benefit to the industries of the town. They subscribed because just then there was a craze for technical education due to a recent panic. They were ignorant masters of works (sons of the men who had created the works), ignorant administrators of the college affairs and ignorant critics of their mismanaged college. I feel sure that if the true meaning of technical education were understood, it would commend itself to Englishmen. Technical education is an education in the scientific and artistic principles which govern the ordinary operations in any industry. It is neither a science, nor an art, nor the teaching of a handicraft. It is that without which a master is an unskilled master; a foreman an unskilled foreman; a workman an unskilled workman; and a clerk or farmer an unskilled clerk or farmer. The cry for technical education is simply a protest against the existence of unskilled labour of all kinds.

To have any good general system the employers must co-operate. Much of the training is workshop practice, and it cannot be too often said that this is not to be given in any college. The workshop in a college serves a quite different purpose. Now, how may the practice best be given? I must say that I like the Finsbury plan very much indeed, but there are others. When I attended this college in winter I was allowed to work in the Lagan Foundry in summer. In Japan the advanced students did the same thing; they had their winter courses at the college, and the summer was spent in the large Government workshops; the system worked very well indeed. In Germany recently the great unions of manufacturers made facilities for giving a year of real factory work to the polytechnic students, but it seems to me that these men are much too old for entrance to works, and besides, a year is too short a time if the finished product is to call itself a real engineer. Possibly the British solution may be quite different from any of these. A boy may enter works at fourteen on leaving a primary school, or not later than sixteen on leaving a secondary school. In either case he must have the three powers to which I have already referred so often. It will be recognised as the duty of the owners of works to provide, either in one large works or near several works, in a well-equipped school following the Finsbury principle, all that training in the principles underlying the trade or profession which is necessary for the engineer.

No right-thinking engineer has been scared by the newspaper writers who tell us of our loss of supremacy in manufacture, but I think that every engineer sees the necessity for reform in many of our ways, and especially in this of education. People talk of the good done to our workmen's ideas by the strike of two years ago; it is to be hoped that the employers' ideas were also expanded by their having been forced to travel and to see that their shops were quite out of date. In fact, we have all got to see that there is far too much unskilled labour among workmen and foremen and managers, and especially in owners. There may be some kinds of manufacture so standardised that everything goes like a wound-up clock, and no thought is needed anywhere; but certainly it is not in any branch of engineering. Many engineering things may be standardised, but not the engineer himself. Millions of money may build up trusts, but they will be wasted if the unskilled labour of mere clerks is expected to take the place of the thoughtful skilled labour of owners and managers. I go further, and say that no perfection in labour-saving tools will enable you to do without the skilled, educated, thoughtful, honest, faithful workman with brains. I laugh at the idea that any country has better workmen than ours, and I consider the education of our workmen to be the corner-stone of prosperity in all engineering manufacture. It is from him in countless ways that all hints leading to great inventions come. New countries like America and Germany have their chance just now; they are starting, without having to "scrap" any old machinery or old ideas, with the latest machinery and the latest ideas. For them also the time will come when their machines will be getting out-of-date and the cost of "scrapping" will loom large in their eyes. In the meantime they have taught us lessons, and this greatest of all lessons—that unless we look ahead with much judgment, unless we take

reasonable precautions, unless we pay some regard to the fact that the cleverest people in several nations are hungry for our trade and jealous of our supremacy, we may for a time lose a little of that supremacy. In the last twenty-three years I have written a good deal about the harm done to England by the general dislike that there is among all classes for any kind of education. I do not say that this dislike is greater than it used to be in England; I complain that it is about as great. But I have never spoken of the decadence of England. It is only that we have been too confident that those manufactures and that commerce and that skill in engineering, for which Napoleon sneered at us, would remain with us for ever. Many writers have long been pointing out the consequences of neglecting education; prophesying those very losses of trade, that very failure of engineers to keep their houses in order, which now alarms all newspaper writers. Panics are ridiculous, but there is nothing ridiculous in showing that we can take a hint. We have had a very strong hint given us that we cannot for ever go on with absolutely no education in the scientific principles which underlie all engineering. There is another important thing to remember. Should foreigners get the notion that we are decaying we shall no longer have our industries kept up by an influx of clever Utilanders, and we are much too much in the habit of forgetting what we owe to foreigners, Fleming and German, Hollander, Huguenot and Hebrew, for the development of our natural resources. Think of how much we sometimes owe to one foreigner like the late Sir William Siemens.

But I am going too far; there is, after all, not so very much of the foolishness of Ishbosheth among us, and I cannot help but feel hopeful as I think lovingly of what British engineers have done in the past. We who meet here have lived through the pioneering time of mechanical and electrical and various other kinds of engineering. Our days and nights have been delightful because we have had the feeling that we also were helping in the creation of a quite new thing never before known. It may be that our successors will have a better time, will see a more rapid development of some other applications of science. Who knows? In every laboratory of the world men are discovering more and more of nature's secrets. The laboratory experiment of to-day gives rise to the engineering achievement of to-morrow. But I do say that, however great may be the growth of engineering, there can never be a time in the future history of the world, as there has never before been a time, when men will have more satisfaction in the growth of their profession than engineers have had during the reign of Queen Victoria.

And now I want to call your attention to a new phenomenon. Over and over again has attention been called to the fact that the engineer has created what is called "modern civilisation," has given luxuries of all kinds to the poorest people, has provided engines to do all the slave labour of the world, has given leisure and freedom from drudgery, and chances of refinement and high thought and high emotion to thousands instead of units. But it is doing things more striking still. Probably the most important of all things is that the yoke of superstitions of all kinds on the souls of men should be lifted. The study of natural science is alone able to do this, but education through natural science for the great mass of the people, even for the select few called the distinguished men of the country, has been quite impossible till recently. I say that it is to engineers that the world owes the possibility of this new study becoming general. In our country nearly all discoveries come from below. The leaders of science, the inventors, receive from a thousand obscure sources the germs of their great discoveries and inventions. When every unit of the population is familiar with scientific ideas our leaders will not only be more numerous, but they will be individually greater. And it is we, and not the schoolmasters, who are familiarising the people with a better knowledge of nature. When men can hardly take a step without seeing steam-engines and electro-motors and telegraphs and telephones and steamships, with drainage and water works, with railways and electric tramways and motor-cars; when every shop-window is filled with the products of engineering enterprise, it is getting rather difficult for people to have any belief in evil spirits and witchcraft.

All the heart-breaking preaching of enthusiasts in education would produce very little effect upon an old society like that of England if it were not for the engineer. He has produced peace. He is turning the brown desert lands of the earth into green pastures. He is producing that intense competition among nations which compels education. If England has always been the last to begin reform, she has always been the most thorough and steadfast of the nations on any reform when once she has started on it. Education, pedagogy, is a progressive science; and who am I that I should say that the system of education advocated by me is that which will be found best for England? In school education of the average boy or man England has as yet had practically no experience, for she has given no real thought to it. Yet when she does, I feel that although the Finsbury scheme for engineers may need

great improvement, it contains the germ of that system which must be adopted by a race which has always learnt through trial and error, which has been led less by abstract principles or abstract methods of reasoning than any race known in history.

## THE ECONOMICS OF MUNICIPAL HOUSING\*

AS great cities grow, it becomes convenient that the centres should be devoted to offices, warehouses, shops, and that people who work in these places, and still more their families, should live in the outskirts. I do not know that anyone has denied this. Certainly the great majority are willing to admit it. At one time it is believed that a quarter of a million people lived in the square mile comprised within the City of London; no one supposes that would be convenient now. There is no reason to suppose that further change in the same direction will not be desirable in the future. Yet, incredible as it will appear to future generations, public opinion, the House of Commons, the London County Council, and some town councils think, or at any rate act as if they thought, that the process has now gone far enough and ought to be stopped, as if the state of things reached about the year 1891 was too permanent, to last for ever and ever. Private owners are indeed still allowed to pull down dwelling-houses and erect shops and offices, but they are abused for doing so and their liberty is at least threatened. But if a new railway or a new street is made—in all probability with the intention of increasing the accessibility of the centre from the suburbs—if even a new London Board school is built, and houses inhabited by persons who have less than a certain income are pulled down in any of these processes, it is required by law or Parliamentary resolution that other houses for these people must be built in the neighbourhood. So it comes about that there are in quarters of London most unsuitable for the purpose enormous and repulsive barracks dwellings, the sites of which are devoted in *secula seculorum* to the housing of the working classes; while the immense cost of devoting them to this instead of to their proper purposes is debited to the cost of improving the facilities for locomotion or to education, and is defrayed principally by the rates on London property, which chiefly consists of houses, and to some extent by the higher charges on the railways consequent on the restriction of facilities for extension. Fifty pounds a head is the average loss involved to the rates of London on every man, woman and child for whom these dwellings are provided. Such is the wisdom of practical men uninformed by instruction in economic theory. This palpable absurdity could never have been perpetrated if the general working of the economic organisation had been understood. In that case it would have been seen at once that the extrusion of over 200,000 inhabitants from the City of London in the past, which is admitted to have been desirable, was effected by the quiet operation of the law of value. It would have been seen that as it became desirable to turn the City to other purposes, the ground in the City became too valuable to use as bedrooms and as living-rooms for mothers and children, and this increase of value drove up the 200,000 inhabitants.

It would have been seen that the change had not come to an end, and no responsible body would have dreamt of putting themselves in opposition to it by buying sites and writing them down to 2 per cent. of their actual value in order that they might be tied up for ever and ever to the homes of a certain number of persons with less than a certain income. If such an unusually dense individual who had failed after many attempts to pass his examination in economic theory had proposed a policy which has been adopted, he would have been asked 70 questions—first, "What peculiar sanctity is there about the position occupied in the closing years of the nineteenth century? Why should this be stereotyped for all time? Why should not the position at the end of the seventeenth century have been maintained? Why should we not endeavour to restore the working-classes to their old home in the City, and remove the Bank of England to Tooting?" Secondly, "Will you imagine you will benefit by the policy you propose?" It is difficult to conceive of any answer to the first question. To the second the reply of the dunce would, of course, be that he thought the policy proposed would benefit the people housed on these expensive sites. This answer would at once be condemned as unsatisfactory. To build houses on land worth 100,000%, and let them to the first-comers of respectable antecedents at rents which would pay if the land were worth 2,000%, would be a very stupid sort of almsgiving if these respectable first-comers actually got the difference between the interest on the 100,000% and the 2,000%. But no one supposes that the

\* From the presidential address by Edwin Cannan, M.A., LL.D., to the Section of Economic Science and Statistics of the meeting of the British Association at Belfast.

et this difference or any considerable part of it. The difference is almost entirely pure loss to the community.

The chief immediate effects of the policy are, first, to retain the centre the men, women and children who inhabit the wellings; secondly, to retain other workers who perform various offices for these inhabitants; and, thirdly, to insure a supply of labour for factories which would otherwise (to the advantage of every one concerned) be driven into the country by the pressure of the high wages necessary to bring workmen to the centre, or to pay their house-rent if they lived there. So much for the utility of economic theory in preventing obstruction of desirable changes. My second claim on its behalf is that it serves to hinder the adoption of specious but illusory projects. This, I think, may be illustrated by examples closely connected with those which we have already considered.

The people who are most anxious to obstruct changes in the channels of trade which are coming about of themselves cause they are profitable, are often extremely anxious to promote changes which will not come about of themselves cause they are not profitable. For this end one of their most favourite devices at present is a State or municipal subsidy to promotion or transport between particular points. So we have "subsidies, free grants to light railways, the construction of unprofitable telegraph lines by the Post Office, and advocacy, at any rate, of the construction of unprofitable railways by municipalities. The practical man, uninstructed in economic theory, feels uneasy about such projects because he does not see where he is to stop, and he feels obscurely that universal subsidisation would mean ruin. But he does not see why he should not go a little way, and he goes sufficiently far to involve a loss quite worth considering.

A knowledge of economic theory would come to his assistance showing him that, as a rule, the most profitable enterprises are those which it is most desirable to undertake first, and that subsidisation of the less profitable does not create new enterprises, but merely changes the order from the more to the less desirable.

Then, too, we find people who are not quite so stupid as to think the working classes should always remain in the places where they were at the end of the nineteenth century, alleging that the way to cure overcrowding is for the local authorities to enter the building trade in a general way, and build houses inside or outside their districts, wherever it seems most convenient. To the mind uninstructed in economic theory it seems obvious that the larger amount of housing there is the more overcrowding there will be, and that the more housing the local authorities provide the more housing there will be. Economic theory, with its explanation of the general working of the organisation of production, suggests two objections. First, an addition to the housing in any locality will not be actual in diminishing overcrowding, in so far as it attracts inhabitants to the spot; a policy which assumes that the comparative plentifulness of houses is not a factor in the determination of the enormous and perpetual migration of people from place to place, which is indicated in the tables of marriages and births and deaths in the census, is doomed to failure. Secondly, economic theory suggests the reflection that the mere fact of a local authority building some houses will cause the whole number to be greater, if for every house built by the local authority one less is built by private enterprise, and that this is very likely to happen. Houses have been built by private enterprise in the past, and in these houses is the whole population is at present housed.

I have seen an enthusiast for municipal housing stand in the empty streets of a town late at night, when every soul in the town was evidently housed, and say, in a tone of conviction, "Private enterprise has failed." In that town four thousand houses had been built by municipal enterprise and more than ten thousand by private enterprise, and private enterprise was adding hundreds every year, while the housing committee of the corporation was meeting once a year to re-elect a chairman. Is it likely that private enterprise will build as much when it is competed with or supplemented by—the term does not matter—municipal enterprise? Why should it? If the municipality turned baker, would the private bakers continue to bake as much bread? Is not the attempt to stop overcrowding by inducing local authorities to build houses exactly the same thing, and just as absurd as it would be to attempt to stop under-feeding by opening municipal butchers' and bakers' shops?

In the long run, I admit, experience teaches. Protection has been alien once in this country, and I have little doubt that it will fall again if it becomes considerable. The policy of obstructing the removal of dwellings from the centre of a city already excites opposition in the London County Council, though unanimity still reigns in those last homes of the "old superstitions, the Houses of Parliament. Chancellors of the Exchequer and finance committees may be trusted to offer a stout resistance, on what they call financial grounds, to the really great development of the system of subsidies. There is even that the municipal building policy may be checked

by the laborious inquiries which show by statistics what everyone knows, that the poor are ill-fed and ill-clothed as well as ill-housed, and therefore lead people to consider how the poor may be made more able to pay for houses, among other things, instead of simply how houses may be built in the absence of an effective demand for them. But I claim that in matters such as these a more widespread appreciation of economic theory, and the quickened intelligence which that would produce would save us much painful experience, many expensive experiments and an enormous mass of tedious investigation.

## THE PALACE OF KNOSSOS.

A REPORT was presented to the British Association by Mr. Arthur Evans on his continued excavations of the prehistoric Palace of Knossos, in Crete. He explained that the work had been arduous and costly beyond expectation, but the discoveries had not fallen short in importance of those of the preceding years. The greater part of the palace, embracing an area of about 5 acres, had now been uncovered. Important new rooms had been disclosed adjoining the halls and "grand staircase" excavated in 1900, and it had been possible to preserve a great part of the upper storey throughout the whole region. A very interesting feature was the complete system of drainage, including latrines with flush pipes, and a succession of stone shafts descending from the upper floors to a network of stone ducts beneath the pavement of the lower rooms, large enough for a man to make his way along them. A highly interesting discovery in this part of the building was a shrine belonging in its existing state to the late Mycenaean period, with the cult objects and idols in place. A painted clay figure of a goddess, cylindrical below, bore a dove on her head. The central cult objects seemed to have been double axes rising between two pairs of sacred horns wrought in stucco. Each of the latter showed the socket for the handles of the cult object between the horns. A small double axe of steatite lay against one pair of horns. Fresh fresco paintings were discovered, including one of a lady in a very modern jacket, dolphins and other fish, and naturalistic foliage and lilies. Fragments previously found and now put together gave exciting scenes from the bull ring, in which girls as well as male tereadors took part. Very beautiful ivory statuettes also seemed to represent similar figures in high action. Further large deposits of tablets inscribed with the linear prehistoric script came to light, mostly referring to the Royal inventories and accounts, and concerning the armour, granary and other departments, many of them dealing in percentages. Clay cups were also found with ink inscriptions, a new departure in the prehistoric script. The exquisite ivory figures of youths showed "the art of Dædalos" in its highest perfection, displaying naturalistic details not found again in such work till the age of the Italian Renaissance. Another extremely interesting find was the remains of a large mosaic of porcelain plaques, many of them representing houses, so that a whole street of "the city of Minos" as it existed about 1500 B.C. could now be reproduced. Here, too, were strangely modern features—houses of three storeys, some semi-detached, and showing windows with four or six panes, oiled parchment having perhaps been used in place of glass. The whole seemed to have formed part of a large design showing scenes of peace and war analogous to those of Achilles's shield. The palace was found to climb down the eastern slope of the hill to a point about 90 metres below the northern entrance, the lowermost terrace having been supported by a quadruple line of wall. On the slope underneath the later Mycenaean palace had been found extensive remains of the magazines of what seemed to have been an earlier royal dwelling going back into the third millennium B.C. In these had been found beautiful painted vases, many of them of eggshell-like fabric, and some embossed in imitation of metalwork. The high civilisation of the kings of Knossos was thus carried back to about 2500 B.C. Below this, again, fresh explorations had been made of the deep Neolithic stratum underlying the whole site, which were productive of a fresh harvest of stone implements, pottery and primitive images of clay, marble and shell, perhaps the tridacna, and pointing to a prehistoric intercourse with the Indian Ocean. Fragments of vases of "Liparite," a form of volcanic glass unknown to the Aegean, from the first palace, pointed to almost as old a connection on the Italian side. The excavation of the south-eastern corner of the palace had still to be completed, and certain work of delimitation had to be carried out in other directions. The lower strata of the palace had also to be explored at several points, and continued researches into the Neolithic deposit were also desirable, as well as the examination of some neighbouring buildings and a renewed search for fossils. Unfortunately, the total amount that the Cretan Exploration Fund (including the grant from the British Association) had been able to contribute towards the year's expenses had again fallen far short of what Mr. Evans had been called upon to expend.

## NOTES AND COMMENTS.

WE have already mentioned the death on the 23rd ult. of Mr. CHARLES POLAND, after a long and painful illness. He retired some years ago, after a very successful practice as a quantity surveyor, in favour of his son, who continues it. Mr. POLAND's *clientèle* comprised several of the railway companies, the Metropolitan Asylums Board, the magistrates for the counties of Middlesex and Surrey, and many prominent architects both in London and the provinces. Among these was the late Mr. G. E. STREET, who at one time gave him the preparation of all his "quantities," as well as the large "measurements" of Bristol and Dublin cathedrals. This connection probably led to his being appointed on the Government side to prepare the quantities for the new Royal Courts of Justice in the Strand, which he did in association with the firm acting for the contractors. In his early days Mr. POLAND was a student of the Royal Academy and London University College, gaining medals and honours in the architectural branch of his profession and having some of his designs hung in the Academy.

A GREAT many people are incapable of realising that the creation of a town requires a large outlay in preliminary expenses. They are willing to admit that with ordinary business a start cannot be made without risking capital. But towns are supposed to come into existence without expense, or that all the burden will be borne by the earliest inhabitants. The opposition which has been raised to the drainage of Selsey exemplifies the peculiar feeling. A glance at a map of the South Coast will show that Selsey beach is the most southern point. Beachy Head does not extend so far. It has been necessary to lay down a line of tramway between Selsey and Chichester. With proper management the town ought to become an important addition to the various watering-places. But practically there is no systematic drainage, for cesspits and cesspools are common. It is now proposed to expend 10,000*l.* on a sewerage system according to plans by Mr. J. W. L. BARRETT. At first sight the expenditure may seem to be excessive, for the assessable value of Selsey is 5,504*l.*, and the inhabitants will be compelled to pay a rate of from 2*s.* 6*d.* to 2*s.* 9*d.* in the pound. But without a proper drainage system there is no chance for a village to develop into a successful town, and especially when the profits are to be derived mainly from visitors.

SEVEN or eight years ago it was resolved to carry out the restoration of the Madeleine, but as the work will be costly, and as the building is now a church instead of a Temple of Glory as originally contemplated, the authorities have some reason for the delay. The fate of the Campanile at Venice has, however, caused alarm in Paris, and it has been determined to make a show of commencing operations. It is believed that sufficient data have not been obtained from which to compute an exact estimate of the cost. It has therefore been decided to expend about 40,000 frs. on the erection of a scaffold, which will enable every part of the building to be examined. The structure will be movable, in order that along the four sides of the building the slightest defect in any of the details can be observed. The design for the present building was the work of VIGNON, and was adopted because it pleased NAPOLEON beyond any of its rivals. But a few years before the revolutions two sets of designs for a church on the site were prepared, one by CONSTANT D'IVRY and the second by COUTURE. The work which is about to be restored was completed sixty years ago.

MANY architectural drawings have a better right to be entitled works of art than drawings of a different class which are prized. It is, however, remarkable how rarely a drawing which can be assumed to have an architectural purpose has monetary value. They are of no account in sale-rooms or with dealers. What is more striking is that, however well drawn and coloured, they cannot be employed like other views. An architect who would hang his drawings in a room to which visitors were admitted would acquire a reputation for "shoppiness." It is only in a room which is supposed to be an office that they may be placed on the walls. In spite of this drawback, much ability continues to be spent on the preparation of drawings

and in imparting to them pictorial qualities. The number which are sent to the Royal Academy, most of which only a minority can be admitted, testifies to the desire of delineating a new building under a form which can be generally appreciated. The new edition of Mr. PHENÉ SPIERS'S "Architectural Drawing" (CASSELL & CO., LTD.) is evidence that there is no expectation of a change in the manner of producing drawings. Reproductions of pictorial drawings in colour and pen and ink are given as well as elaborate representations of details. An examiner under the Board of Education lately complained about the careless way of making working drawings. A study of such examples as those by Mr. WATERHOUSE and Mr. PLUMBE in the book should be sufficient to convince students that drawings cannot be too exact. Specimens are shown which are worth acceptance as models for all the varieties of drawings which are likely to be required in an architect's office in out-of-doors study. The new edition contains additional plates and information. It is superfluous to praise a treatise which has already deservedly obtained commendation.

THE Brown Book of the Architectural Association for the session 1902-03 has been issued. The annual general meeting will be held on October 3, when Mr. H. T. HARRIS will deliver his address and the prizes will be distributed. At the fortnightly meetings papers will be read on "Houses and Architecture" (T. R. SPENCE), "Roof Coverings" (F. C. EDEN), "Some Notes on Sanatoria for Consumptives" (CECIL C. BREWER), "Architectural Practice, Real and Ideal" (J. S. GIBSON, A.R.I.B.A.), "The Study and Delineation of Old Buildings" (W. H. BIDLAKE, A.R.I.B.A.), "A Few Thoughts on the Attitude of the Young Architect towards the Crafts" (J. DUDLEY FORSYTH), "What is the Real Value of Greek Work to the Modern Artist?" (Professor G. BALDWIN BROWN, M.A.), "The Aesthetic Treatment of Modern Bridges" (H. H. STATHAM, F.R.I.B.A.), "Competitions" (H. B. CRESWELL and A. W. S. CRESS, F.R.I.B.A.), "Ancient and Modern Town Houses" (HENRY WHITE, A.R.I.B.A.), "Palladio," illustrated by lantern views (BANISTER F. FLETCHER, A.R.I.B.A.), "Architecture and the Public" (A. NEEDHAM WILKINSON, A.R.I.B.A.). The day school will be opened on September 29, and the evening school on October 6.

## ILLUSTRATIONS.

LYDD'S BUILDING, FENCHURCH STREET, E.C. : PRIZE, 1ST FLOOR LANDING. BOARD-ROOM FIREPLACE.

CATHEDRAL SERIES.—HEREFORD: THE RETRO-CHOIR. IN SOUTH-EAST TRANSEPT.

RESIDENCE, BARNT GREEN, WORCESTERSHIRE.

THE residence, Barnt Green, Worcestershire, is now being built, but it is intended to be constructed with 1½-inch Leicester bricks, the roofs to be tiled with Welsh shingle. There are to be the following rooms:—Dining-room, drawing-room, small study, larder, pantry, kitchen and scullery, lavatory and large entrance hall; first floor—two bedrooms, bath-room and lavatory, and two attics. It is estimated to cost 2,250*l.*, including small stable and coach-house for two horses, with small motor-house at side. The woodwork outside to be stained with creosote, the wood being left rough. Mr. E. STANLEY MITTON is the architect.

GORING CHURCH TOWER, OXON.

HOUSE AT SOUTHEND.

THIS drawing represents a residence which has recently been erected, with some modifications, by Mr. J. W. WATSON, of Southend. It occupies a good position, and has a side view of the sea. The contractors were Messrs. WHUR & CAMPKIN, of Southend, and the contract price was 984*l.* 16*s.*

PRINTERS' PREMISES AT CROYDON.

THIS is a reproduction of the drawing in this year's Royal Academy, and represents the new portion of Messrs. ANDRESS & CO.'S premises. At present the alterations have only been partly carried out. The materials are red-brick and Bath stone dressings. Messrs. WM. SMITH & SON, of 202 London Road, Croydon, are the contractors.

## HISTORIC WESTMINSTER.

THE fifty-ninth annual congress of the British Archaeological Association was opened at Westminster on Monday. The members met at Caxton Hall (the old Westminster Town Hall) in the afternoon, when the mayor of Westminster, Lieutenant-Colonel Clifford Probyn, president, formally declared the congress open. St. Margaret's Church and Holland House, Kensington, were visited.

The President delivered an address, in which he said that more appropriate place than Westminster could not be found for the congress of the British Archaeological Association. Westminster was more ancient than the City of London, according to Sir Walter Besant, for Thorney or Bramble and—the former name of Westminster—was an important trading centre long before Londinium grew out of the marshes. Mayor of Westminster he was bound to regard with approbation the increasing attention paid to the study of ancient memorials of a national character rather than to the exclusive admiration of the more remote remains of the Romans and the Greeks. At one time nothing that was not "classical" was deemed worthy of the attention of the antiquary. But the Association, being so emphatically the British Archaeological Association, had taught us that archaeological research, like charity, best began at home, rewarding us with richer and more informing results, involving a more devout veneration for those who had gone before us, who it better than they knew, and inspiring a more knowledgeable pride and affection for our native land. He marked with the warmest approval that particular object of the Association—the preservation, as far as was possible, consistently with the operative requirements of the living, of our ancient monuments. Old houses and historic alleys must, for example, never old and picturesque, give way to improvements such as those now being conducted in the Strand, with which he had great deal to do in his official capacity, but much could be done to preserve from wanton destruction or ignorant neglect the works of ancient times that still existed everywhere throughout this England of ours. He would be wanting in appreciation if he did not mention the work of the London County Council in this respect. He desired to see the powers of the Ancient Monuments Protection Acts conferred upon the Westminster City Council, so that the Council might be enabled to preserve such a monument as the old Roman bath on the Strand, that might perchance be any day swept away by the ruthless speculating builder, after having weathered the rigors of centuries. It should certainly be his business to press upon his Council their imperative duty to collect, catalogue and catalogue the invaluable monuments and records, many of them almost unknown to the antiquary, of the eleven centuries that constituted their city, to which students could have ready access. He considered that such a work would commend itself to that Association as worthy of the city, and their President he should feel it incumbent upon him to stress its importance upon his Council. The notorious Colonel Blood, whose attempt to rob the Tower of the Royal Crown had been immortalised by the author of the "Romance of London," was buried under the green turf of Christ Church, 1, Victoria Street, opposite Caxton Hall. Blood died, after fortnight's "distemper"—diagnosis in those days was not very precise—on August 24, 1680, and was decently interred five days after in the Broadway Churchyard, as it was then called.

## PRIMITIVE UNDERGROUND DWELLINGS.

At the Anthropological Section of the meeting of the British Association at Belfast three papers were read which related to ancient subterranean dwellings in the British Isles.

The first was by Mr. William J. Fennell on "Some Ulster souterrains." He remarked that the north-east corner of Ireland was peculiarly rich in evidences of prehistoric man. Though no houses of any kind were known to exist attributable to the Stone Age, there was another class of built structure—souterrain—which might be claimed as the primeval architecture of the country, for these souterrains existed in great numbers, and fresh ones were constantly coming to light. A souterrain might be defined as a subterranean place of refuge, in that sense only a dwelling. The entrance was either naturally difficult of approach or cunningly hid, and the interior was generally long, low, narrow and winding, and beset with frequent barriers, locally known as "difficulties," through which one person could pass at a time, and then only by creeping.

If these were the abodes of peace this succession of barriers would have no meaning, although one at the entrance might be useful. That they were not burial-places was evident, as no relics of early cremation or remains of human bones, or in fact of any kind, had been found in them. The souterrains were not burrows, but walled chambers connected by passages well defended by built of dry masonry walls and roofs, and afterwards

covered up by earth and eventually hidden by vegetation. The exterior covering was always very thin, so that in many cases they were close to the surface. The construction was invariably of rough unhewn stones from the neighbourhood, and the roof was invariably formed by the overlapping of one stone on another, a system followed in much more recent times. The barriers were formed of walls rising from the floor almost to the roof, then a space of 12 or more inches to the next wall, which descended from the ceiling to within 15 inches of the floor, and leading in some cases to a long, low tunnel 16 inches or 18 inches high, with a similar barrier at the other end. No two souterrains were alike in plan; some were straight, or almost so, with chambers branching off. Some were extremely short, while others were considerably over 100 feet long. The souterrain at Muckamore was a solitary example of a two-storey building, entered from the field level to the upper floor, and from that to the lower one. Mr. Fennell thought that it was impossible to assign a date to these rough, rude structures, but the diminutive one at Connor, county Antrim, had two ogham stones inserted, so that at least some of them must have been erected much later by a race who used an alphabet. It showed a distinct advance in building construction in the use of a series of lintel stones—including the ogham ones—to support the roof, but even in this case it seemed to have been simply a place of refuge.

The paper by Mr. George Clinch, F.G.S., described "Some Ancient Subterranean Chambers Recently Discovered at Waddon, near Croydon." He said that excavations for a sewer at Waddon House in June 1902 revealed three subterranean chambers cut in a bed of Thanet sand, and partly occupied by sand which had fallen or been washed into them. In each chamber, however, a compact floor was found at about 15 feet below ground. The chambers were of beehive shape, about 7 feet high and 12 feet or less in diameter. Each had its independent entrance opening on the south-south-east side, but no other means of access till the domed roofs were cut open by the sewer trench. Below the sand which covered the floors of the chambers several cores and chips of green-coated flints were found, with small fragments of imperfectly baked pottery and larger fragments of Romano-British pottery. The small dimensions and the form and plan of the Waddon chambers, the absence of a perpendicular shaft and their occurrence in sand differentiated them entirely from the so-called "deneholes;" nor had they any feature in common with the "flint mines" of Grimes's "Graves and Cissbury," nor with the beehive-shaped cavities found in the Isle of Purbeck in 1883. On the continent of Europe the most similar chambers were those at Pelmella in Portugal, which M. Cartailhac had ascribed to sepulchral purposes in the latter end of the Polished Stone Age. Similar chambers had been noted in Brittany and elsewhere. The subterranean "beehive tombs" at Mycenæ also were identical in plan, though different in dimensions and material. Bones of animals had been found in the loose sand in the Waddon chambers, but no human bones; nevertheless, the evidence seems to show that the chambers were primarily sepulchral. South-east and east of Waddon there were many hut circles which had been attributed to the Neolithic Age. They were circular in form, with marks of entrances on the east and south-east side, and exhibited general resemblance in dimensions and plan with the Waddon chambers. The Waddon discovery was therefore of some importance as evidence for the size, shape and plan of prehistoric dwellings; the vaulted roofs cut in hard sand reproducing in general form the interlaced boughs, benders and wickerwork of the ordinary surface hut, and the lateral passage the doorway of the neolithic dwelling. The same idea of interment within a house survived during the Bronze Age; but when cremation came into vogue a miniature copy of the Bronze Age house—the "hut urn"—was sufficient repository for the ashes. The tradition of the circular neolithic hut was carried on in the Celtic beehive dwellings of Cornwall, Wales, Scotland, Ireland and Gaul; and probably in the circular buildings of subsequent English architecture. The Bronze Age dwellings, on the other hand, which were reproduced in the "hut urns," might be regarded as the prototypes of the square or angular forms of ecclesiastical and domestic architecture.

Mr. David MacRitchie read a paper on "Underground Dwellings in the British Isles," in which he described certain primitive underground habitations as typical of a class of structures apparently existing at one time throughout the British Isles, though the greater part of the specimens now remaining were found in Ireland and Scotland. It was hardly possible to conceive of human dwellings more archaic in character, and yet some of them, if not all, belonged to the times that are quite historic. Two specimens, one at Crichton, in Mid-Lothian, and the other at Newstead, in Roxburghshire, must have been built after the arrival of the Romans in Britain—and probably a long time after that date—for the reason that a number of dressed stones with Roman orna-

mentation had been used in their construction, presumably taken from Roman ruins. That these underground structures were used as places of human abode was obvious, because they contained domestic utensils, such as hand-mills and personal ornaments, as well as the broken bones of animals used by man as food. In a few instances they had a fireplace, but this was very exceptional. Like the similar dwellings of the Eskimo, these underground habitations were so well protected from the cold of even the keenest winter that a fire was not necessary, and oil lamps sufficed for heating, lighting and cooking. From their characteristics therefore these underground structures quite justified the name of "earth-house," which was given to them in the Norse sagas, and also in living popular speech. In appearance they varied considerably, but most of them had their roofs about a foot or two below the surface of the ground, entrance being obtained from above by one or more downward-slanting passages. They were built of rough, undressed, unmortared stones, the walls gradually converging until they met in a "cyclopean" or "false" arch, completed by large flagstones laid across. In some cases their very small dimensions supported the traditional belief that they were built for a dwarfish race.

Professor Boyd Dawkins said the whole question of date, structure and use was one of very great difficulty, which was not diminished by the comparatively small areas of the distribution of these underground structures in the British Isles, those being the districts mentioned in the papers, and the Orkneys, the West of Scotland and Cornwall in the neighbourhood of Penzance. Their structure was not far removed from that of the souterrains of the Pict houses. He did not know of any evidence bearing on the date except that brought forward by Mr. MacRitchie. The date was certainly after the ogham time, which he thought Professor Rhys was right in dating from the time of the Roman occupation of Great Britain to the twelfth century. In respect to the Waddon chambers discovered by Mr. Clinch, as the evidence stood he looked upon them as ancient habitations and not as tombs.

Dr. Monro pointed out that the beehive structure, which did not exist in Scandinavia or France, necessitated building from within with weight above, either a mound or pressure of soil. The chief question was whether there was any evidence that the structures were pre-Roman. The answer seemed to him to be in the negative, and that the structures were not prior to the Iron Age but post-Roman and even Mediæval. He thought that there was no subject in British archaeology which required more care, attention and collection of evidence than that of the papers read that afternoon.

Mr. Coffey said there was no evidence in Ireland that souterrains went back to pre-Roman times. Very few objects had been found in them, but these few pointed to their existence between 600 and 1000 A.D. The ogham stones used showed that they were later than pre-Roman times. There were a number in Ireland around the forts erected in Danish times, and the reason for making them was that it was difficult to find a better system of defence than these souterrains. In respect of the pigmy question, he agreed with Professor Boyd Dawkins that the size of the structure had no direct relation to the size of the people, and it was necessary that they should be restricted in size to place difficulty in the way of the enemy. Many primitive peoples had small entrances to their dwellings by which they had to creep in, though they were full grown themselves. If the structures were within the historical period of the Roman occupation it would be very difficult to maintain the theory of their occupation by pigmies.

The president (Dr. Haddon) said he had visited a few of these structures, and the evidence seemed to him to point to a post-Roman date; and, further, that no traces of a pigmy race had been discovered as existing at that time.

Mr. Fennell, in replying, said he still held that they were places of refuge, and that the ogham stones and Roman pottery found was no evidence of age, the ogham stones having been probably plundered and worked in at a later date.

Mr. MacRitchie also replied in a few words.

### SANATORIA FOR CONSUMPTIVES.\*

AT the invitation of the Council of the Sanitary Institute I have undertaken to-day to address you on the subject of sanatoria for what is called the open-air treatment of persons suffering from consumption. The subject is one of much practical interest to all, and primarily to those who are charged with the duty of safeguarding the public health. It will of course be understood that I am in no way dealing with the medical side of the question, but solely with the question of providing hygienic buildings specially designed to give medical men every opportunity of practising their curative and preventive art. In this Congress and at this time, one can hardly

\* A paper by Mr. Edwin T. Hall, F.R.I.B.A., read at the Congress of the Sanitary Institute at Manchester.

pass to the consideration of our subject without first expressing our joy and gratitude to the Most High for the restorative health of His Majesty the King, who has lent the weight of great authority and energy to press on all our consideration the study of means by which the great scourge of tuberculosis may be removed from suffering humanity.

Now, a sanatorium is not only a place where patients are lodged to undergo a medical "cure," but it is a school where they are taught how to live so as to attain and preserve health; a school where the principles of hygiene are systematically regularly taught from day to day. Its educational advantages are among the greatest benefits conferred, and each inmate sent forth as a missionary to disseminate his knowledge to his family and friends. Were there nothing else, the value of this to the community would alone justify the erection of such buildings all over the country and their equipment with a staff of able and devoted medical experts as teachers, but what is added is the fact that the patients or scholars are in all cases relieved, and in a large percentage of cases cured of a distressing malady, they are themselves object-lessons enforcing the doctrines they preach.

It need hardly be said that a sanatorium should itself be a model of a hygienic abode, and only those who are intimately acquainted with the subject know with what minute study of the smallest detail this end can alone be attained.

There are three important factors for consideration in connection with every project for a sanatorium. These are (1) the site, which involves the questions of subsoil, altitude, shelter, prospect and aspect; (2) water supply; and (3) sewage disposal.

First as to site. A sandy or gravel subsoil should be selected if attainable, so that rain may be readily absorbed. Stiff clay is impervious, and a site with clay not far from the surface gets waterlogged. Evaporation creates ground mists or fogs, which are very bad for consumptives. But a well-lying site on sand or gravel is as bad, because the subsoil water percolates through the subsoil and renders the earth moist and cold. This percolation also forces outwards ground air, air charged with carbonic acid gas. The ideal site is the southern slope of a hill, sheltered from north and east winds by trees. On sandy soil the trees will generally be some species of pine, the resinous exudation from which is health-giving, imparting a clean and brisk flavour to the air.

It is sometimes held that the near presence of sheets of water is objectionable, but that, I think, only applies to stagnant waters. A rapid river may be beneficial owing to the change of air to which its movements give rise. Witness the case of Nordrach in the Black Forest, where the Hammerbach, coming from the higher lands, passes through the village, close to some of the buildings of Dr. Walther's colony; or again, Harlaching, near Munich, standing on a hill above the torrential Eiser.

There are in our beautiful country scores of sites where the life and movement of such waters have a bracing and energising influence on every person, whether sound or sick.

Given, then, a suitable site amid trees, the next thing is to place the sanatorium in an elevated position. It is not good to put it on a flat plain. Shut in by woods, with a strictly limited prospect, the influence on a patient is bad. There is a sense of confinement most depressing to all nervous temperaments. Hohenhonerf, not far from Cologne, is high up on a mountain, with beautiful and very extensive views of the Rhine. Nürnberg-Engelthal, in Bavaria, commands a wide stretch of scenery. From Falkenstein, in the Taunus mountains at Cronberg, near Frankfurt, the panorama is only limited by the power of sight. Dr. Walther's sanatorium at Crookesbury Ridges, in Surrey, has in a less elevated position also extensive views. The Brompton Hospital sanatorium at Frimley, in Surrey, is on a high site above the Bury Road, to the south of which stretches Frimley Common.

Again, there should be a wide clearing on the south side of the building and in a less degree on the other sides. Admit of building and to gardens plenty of sunlight. The curative value of sunlight, with its germ-destroying power, is immeasurable. The clearing, too, gives the sense of freedom and expansiveness. The charm of the seaside is largely the gratification of this sense. On the north and north-east sides get all the shelter that trees afford from the cold winds.

Another point of great value is to set the building well away from a high road, and in a sandy district this is of especial importance. Dust of any kind is, of course, very bad for affections of the throat or respiratory organs, and the dust from a high road, laden as it is liable to be with faecal matter and carried about by high winds, is worse than all.

Of course, a good water supply is essential. Where a public service is not at hand, a spring should be available on the higher side of the sanatorium. It will there not be in danger of contamination from sewage, and the water will flow by gravitation to the building—a great saving in expense of maintenance.

Sewage purification and disposal are important matters. In small institutions earth closets are satisfactory in every way.

the limited quantity of liquid refuse, such as bath and sink water, can easily be dealt with; but in larger sanatoria some form of underground sewage disposal becomes a practical necessity. Where there is a public sewer at hand there seems to be no objection to its use. As, however, a good sewer for a sanatorium is generally far from all public sewers, the other method of disposal of sewage must be considered, and it may be of interest to lay before you information regarding what is done in various places in South Germany and at Nuremberg.

As found in South Germany both in sanatoria and general hospitals it was the common practice to treat the sewage with a suspension of sulphur earth, a natural product, of which, I have seen, there are considerable deposits near Cologne. The treatment was a very simple process. At Falkenstein the mixture was contained in a closed vessel placed in the outlet chamber of a divided sewage receiving tank. The inlet chamber received the sewage, from which, by a screen or tray, paper, was separated. This chamber, at a certain level, emptied itself by a syphon. To the top of this syphon a small pipe in the mixture vessel was attached, and as the sewage passed it drew a charge of the mixture by suction. The effluent was then conveyed from the second chamber to another receiving tank at a distance divided into two chambers, and ultimately into four settling tanks, used in rotation, and after resting there a period ranging from two to four weeks, the liquid was discharged on to the land. There was no smell whatever, the extreme simplicity of the installation was commendable. At the Nuremberg General Hospital, which is quite new, a more elaborate apparatus is used. The main drains discharge into a cesspool or receiver, with an outlet trough at the level of the inlet pipe. This trough discharges on to a species of water-wheel contained in the central of three open brick tanks. The two side tanks contain the sulphur earth mixture, kept in constant motion by agitation to prevent precipitation. The rotation of the wheel is arrested as the bucket comes into position under the trough and is filling. While the filling is going on two small streams of the sulphur earth mixture flow in from the side tanks. The treated sewage then passes over a weir to a settling tank, with an iron screen over it to catch foreign substances, and thence to two large circular settling-tanks, intended to be used alternately, with funnel-shaped bottoms about 7 metres in diameter in the centre. Suction pipes are fixed to near the bottom of these tanks, and the heavier deposit is pumped up to a hydraulic press, when the sewage is formed into cakes to be used away for manure. The liquid from the tanks passes

at Harlaching, after similar treatment with sulphur earth, the sewage passes into the rapid Eiser; and I am told all the sewage of Munich passes into the river without ill effects, though, I suppose, to the tremendous current. At Nordrach the sewage goes into an ordinary closed cesspool. When the cesspool is emptied by means of a portable closed-tank apparatus, probably known to many officers of health and sanitary engineers. I did not hear of any case in South Germany where a septic tank treatment was adopted. In the sanatorium at Wokingham, in Surrey, there is a septic tank with two or three settling-tanks attached, and from these the effluent passes on to the land. Having dealt with these general features, there is one point of danger to the disease which demands a few words. The danger from consumption appears to arise from bacilli contained in sputum. When the moisture evaporates these bacilli are blown about and become a source of danger. In all sanatoria provision should be made for dealing with sputum by ventilation. At Nordrach each bedroom is fitted with a pair of wooden basins—one for washing, the other for spitting. It seems to me the waste pipes of the latter must become contaminated, and in any case I do not like the idea of sputum being blown into a pipe.

Passing from the consideration of site, water-supply and sewage disposal, we now turn our attention to the buildings to be erected. First, what should be the size of the institution? Ask for a county or large town a public sanatorium of about 100 patients will be found to be best and most economical for the minister. It may be objected that this is too large for a district, but it seems to me that when once the usefulness and advantage of these institutions are demonstrated and appreciated by the general public and by life insurance companies, this standard size will be found to be none too large to demand on it.

Assuming the size to be determined, we have to settle what should be the bases of the design, and these, I think, may be set forth:—(1) Let the whole be conceived on broad lines, and to suggest expansiveness—plenty of room to breathe and move; (2) plenty of sunlight and fresh air into and through the patients' rooms; (3) disconnection of all buildings containing w.c.'s and other sanitary appliances; (4) separation of patients into groups for classification of patients; (5) limitations of destructive fires and provision of means of escape; (6) air accommodation for those temporarily unable to walk;

(7) limitation of height of buildings; (8) housing the medical and nursing staff away from their daily work; (9) separation of administrative buildings from the hospital proper; (10) avoidance of all angles, ledges and crevices for the harbouring of dust.

There is one all-important detail to be settled at the outset before putting pencil to paper, and that is, shall patients be accommodated with single or multi-bedded rooms? On this question there is difference of opinion. By some it is held that for the poor rooms with more than one bed are best, as these patients like company.

There are cases where two or three beds in a room may be of advantage, as where hæmorrhage is likely to occur, when one patient may temporarily help another pending the arrival of the doctor or nurse. But the majority of doctors hold that patients who have separate bedrooms do the best as they are not disturbed by others, and the King's advisory committee have adopted this principle for the new sanatorium about to be erected by His Majesty.

From the consideration of this subject we are led to another, viz the external reclining balconies or Liegehallen, as they are called in Germany. In these are placed couches where the patient may lie in the open air all day, and perhaps all night. Dr. Walther, of Nordrach, does not adopt them, as he thinks they tend to make patients lazy, but they are very generally adopted, and in certain stages of the disease are doubtless of great value. Every inducement should in every case be given to make patients get out into the open air as much as possible, the bedroom being only used at night. Moderate exercise, as the patient improves, is recommended by all medical experts, and it is not uncommon to find patients doing their ten, twelve and fifteen miles walk a day after they have been some time in a well-organised sanatorium.

If the foregoing general principles be borne in mind it will be easier to appreciate the relative merits of the different buildings which I now propose to describe to you, and to illustrate by the drawings hanging on the surrounding walls, which I have prepared after visiting and studying all the buildings.

It will be noted that all the sanatoria submitted to your notice differ radically in planning. Unless otherwise mentioned, all the German institutions have double casement windows, are heated by low-pressure steam radiators with no fireplaces, and are electrically lighted.

In some of the latest institutions, as Harlaching and Krailing, the administrative buildings are separate and distinct from those containing patients, but not so in others, particularly in earlier ones. For example, at Falkenstein, which is the first institution I propose to describe, the kitchens, larders, &c., are in the basement of the block. It must, however, be borne in mind that this institution commenced in what had been a private house, and although by additions it is now a large place, the original house remains part of it. The staff, except the medical men, live in the block.

It will be seen by the general plan that there are detached blocks—engine and boiler-houses, stables for horses and cows, workshops, laundry, &c.

The main building, containing a basement and three floors above, one of which is in the roof, consists of a centre block facing east-south-east, with two symmetrical wings at a slightly obtuse angle, enclosing on three sides a terraced garden. To the east is a very large dining-hall open on the south-south-east to a wide verandah, which is continued in an easterly direction to the chief doctor's house, forming a covered promenade about sixty-five metres, or, say, 200 feet long. On the south side a long annexe, with an enclosed verandah or gallery facing east, leads to another doctor's house containing the consulting-rooms, &c. On the west side of the gallery are the gardener's house, mortuary, &c. The total frontage in a straight line measures about 1,000 feet. The sanatorium has accommodation for 120 patients of either sex, with seventy single and twenty-five double bedrooms, generally of a large cubic capacity. There are three main staircases.

The staff consists of a medical superintendent with three assistants and a managerial staff of four. The total staff, male and female, indoor and out, is ninety-two. There is one waiter to eight or ten patients. There is no regular staff of nurses, and no separate accommodation for them. They are only taken in if required by patients. There are only two slipper-baths for patients and a douche-room in the basement. The water-closets are contained in the building. The floors of bedrooms are covered with linoleum; the walls are plastered. There are no rounded angles. The Liegehallen are attached to the building, forming wide verandahs on the three sides of the terrace at the level of the basement floor, which is above ground on this side. In the grounds there are large open pavilions and smaller summer-houses containing couches, all fancifully and luxuriously appointed, and in the building are winter garden, reading, writing, billiard and music-rooms. Altogether this is a high-class hotel, medically conducted, where wealthy patients may live cheerful lives in beautiful air and glorious scenery.

Ruppertsheim, a few miles distant, near Königstein, is modern, is for poorer patients, and is more strictly a sanatorium. It is on plan a flat crescent three storeys in height, above a basement, with two short wings, and accommodates 122 patients, ninety male, thirty-two female. There are no separate administrative buildings, but the kitchen is in the west wing on the ground floor. There are eighteen rooms with one bed, seventeen with four beds and six with six beds, of a cubic capacity per patient for men of twenty to thirty metres, and for women of thirty to forty metres. The staff consists of the medical superintendent, with two assistants, a secretary and a lady superintendent or matron. There are three female and two male nurses, and twenty-four male and female servants. There are two main staircases from bottom to top. The patients' rooms face south and are in single file, with a corridor on the north side. There are nine slipper-baths for the patients and one douche for each sex, all in the body of the building. The floors of bedrooms are of plain uncovered deal boards; the walls and ceilings are of plaster. In the older portion of the building there are no concave angles to the rooms, but in that most recently built all angles are concave except at the floor, where they are most needed. At the ends of the building there are two-storeyed Liegehallen, about 12 feet wide.

One of the medical officers, who courteously showed me over the institution, was of opinion that wards with as many as six beds were not so good as those with only two or three. He thinks a few balconies to bedrooms, large enough to take beds, are desirable.

The Nürnberg Heilstätte, Engelthal, a few miles from Henferfeld, is a modern building—a parallelogram consisting of basement, three other floors and then rooms in the gables. There is no separate administrative block of buildings. It affords accommodation for fifty patients in seventeen rooms, two containing five beds, two with one bed, the others having three beds each. The cubic capacity per patient is forty metres. There is one staircase, which is not sufficient for so high a building with so many residents. All patients' rooms face south, and have a corridor on the north side. There is a medical superintendent, with no assistant. There are three female nurses and seven female servants. There are four slipper-baths and three douches, all in the body of the building. There are six water-closets for patients similarly placed. A handsome dining-room faces south, and is served from the kitchen in the basement. The floors are of uncovered deal boards. Walls and ceilings are of plaster and have concave angles, except at floor, which omission the doctor laments. The plastered surfaces are artistically decorated, a feature which I commend to the notice of our hospital authorities. The Liegehallen are quite detached, one being on the terrace at the south-west of the sanatorium, the other in the woods.

(To be concluded)

## PREHISTORIC REMAINS.

IN the Section of Anthropology of the British Association on Saturday some papers were read on prehistoric remains. The Hon John Abercromby read one on the oldest Bronze Age ceramic type in Britain: its close analogies on the Rhine, and its probable origin in Central Europe. He said that the oldest type of pottery in Britain was the "drinking-cup," for which he proposed to substitute the shorter term "beaker." Thurman recognised three types, designated *a*, *b*, *c*. Type *a* seemed to be the oldest and *c* to be derived from it; *b* had a different secondary origin from *a*. In 25 interments the beaker was accompanied by ancient objects; three with large flint daggers, three with buttons with the V-shaped perforation below, and five with stone wristguards, all of which objects belonged to the later Neolithic period on the Continent. None of the objects found with the remaining 14 interments were of later date than the thin, flat, broad knife-dagger. As no other ceramic type in Britain could show such a pedigree, it was clear that the beaker was the oldest, though before it died out several other types of fictilia came into use. The beakers found with food-vessels and burnt interments were shown by their form and ornament to belong to a rather late period. As ornamentation was a very important subject, 59 examples taken from the three types were exhibited and contrasted. The ornament, like the form, pointed to a different secondary origin for *a* and *b*. The localities where beakers have been found in Great Britain and Ireland were shown on a map. Though *b* was the least represented numerically, it had the widest diffusion, and extended from the coast of Sussex to Sutherland—perhaps to the Shetlands—and was the only type at present known in Ireland. Mr. Abercromby then compared ten photographic examples of type *b* from the Rhine, between Coblenz and Mainz, with ten British. Some of the ornament on the Rhenish beakers was borrowed from a different type, known as the "bell-shaped

beaker." This particular system of ornamentation was found west of the Rhine valley, south of the Danube, east of about the longitude of Vienna, or north of the latitude of Bern. The origin of type *a* could only be suggested, not demonstrated. Its form seemed derived from the much earlier "Schnur-becher" and its later offshoots. But the practice of distributing the ornament in zones or bands was probably owing to the influence of the "bell-beaker." This is an extension of Dr. Götze's theory. Type *b* was derived from a type much more influenced by the "bell-beaker," though some examples of it were perhaps merely later modifications of "bell-beaker." In type *a* the influence of the "bell-beaker" was much less direct, so that supposing both *a* and *b* to be offshoots of the "cord-beaker," they had different secondary origins, but went back to a common form at a point in the many centuries earlier. But the possibility was not excluded that the origin of *b* was to be referred entirely to the "bell-beaker," in which case *a* and *b* had an independent origin. The areas in Central Europe where the "cord-beaker" and its offshoots, as well as the "bell-beaker," were found, were Northern Bohemia and the region of the Saale, a western tributary of the Elbe. Type *b* fully developed occurred on the Rhine both at the centre of its course and near its mouth, and from the Rhine it passed over to Britain.

Mr. W. J. Knowles read a paper on "Objects of the Platin Kind from the Interglacial Gravels of Ireland," and exhibited the implements he had collected. In his paper on "Stone Axes Factories near Cushendall, county Antrim," he explained that there were several centres where stone axes had been manufactured in the neighbourhood of Cushendall, but they were most numerous in Glen-Ballyemon. One well-marked site, a field belonging to Mr. Richard McCurry, in the townland of Tanmaharry, or Tavnagharry, was observed about three years ago on the natural pasture being broken up. Many axes in a rudely-chipped state were found in it—some whole, others broken, probably in the course of manufacture. Mixed up with these were pick-like objects, scrapers and numerous round balls (evidently hammer-stones) of the same kind of stones that from which the axes were made; flakes, too, were in great abundance. Many of the flakes showed dressing or marks of use along the edges. The field containing these objects had an elevated position and commanded a fine view. There was probably an encampment at this place, though he could observe no signs of kitchen-middens or remains of food, such as split bones. While some of the axes in this and other sites in the same county were finely finished, others were very rude. All stages in the manufacture could be easily traced, from the boulder with a few chips removed, and specimens showing more and more chipping, to the completed axe. The axes were of various sizes. One fine specimen was  $14\frac{1}{4}$  inches long, and weighed  $8\frac{3}{4}$  lbs; some weighed 5 lbs, others 4 lbs. to 3 lbs. The average specimen would weigh about 1 lb., and some small chisel-like objects only 1 oz. or 2 ozs. The types were various, some of which might be considered of a newer pattern than others, either introduced or developed from an older type; but most types were among the rudely-made specimens—edges showing various forms of curve, expanding edges, square sides, swages and even kitchen-midden types—all made in the forms at the first, and apparently contemporaneous.

A third paper on "The Manufacture of Arrow and Spear-heads" explained that the majority of Irish flint arrow and spear-heads were made from flint flakes.

Mr. William Cunnington read a paper on a recent important find of palæolithic flint implements at Knowle, in Wiltshire, himself and Mr. William A. Cunnington.

Mr. Robert M. Young, in a paper on the excavation of a primitive site occupied by Irish elk-hunters near Groomsport, county Down, described the remains of a primitive settlement first discovered by him in July 1897 on the county Down coast. The site was adjacent to the sea, beneath a grass-grown field, formerly a sand dune. At a depth of several feet were found a number of burnt-clay hearths, about 1 foot in diameter, surrounded with charcoal and burnt stones. There were numerous fragments of bones, including those of the Irish elk, broken to extract the marrow. Professor R. O. Cunningham had also identified a small species of deer, boar, and probably goat. Shells of limpet and periwinkle of unusual size occurred in masses, and whelks, mussels, scallops and cockles sparingly. The principal relics found comprised a bronze pin, an amulet of flint with natural perforation, burnt-clay food-vessel, simply incised, and numerous implements of schistose slate. From the appearance of the deposit now covering the ancient ground surface, Mr. Young thought that it had been probably deposited by the sea, which to do this must have risen at least 10 feet above its present highest level.

Mr. G. Coffey read a paper on the "Hallstatt Style Ireland," and with the aid of the lantern illustrated it showing a series of slides of objects which had been discovered in several places. The series included the Hallstatt or Tanbrian bronze sword and scabbard chapes, rivetted caldrons, chains and pendants. Mr. Coffey explained in detail the

atures of the Hallstatt technique, and showed how abundant the style was in Ireland. On the question of the introduction of iron into Ireland he thought he deduced from the number of early La Tène in Ireland that iron was known before the close of that period. Mr. Coffey showed three rude stones decorated with La Tène ornament, which constituted a new ornament, as they showed for the first time La Tène on stone.

Mr. Ridgeway warmly supported Mr. Coffey's paper, and lauded the La Tène examples as forming one of the most important discoveries in recent archaeology.

## THE TREATMENT OF SMOKE.\*

(Continued from last week.)

### Incidental Advantages.

Questions that I have suggested as suitable for being put before practical men of science are two—first, whether mechanically and economically possible to substitute for the system of chimneys a method of collection of the smoke from houses by mechanical or thermo-mechanical means, and secondly, whether under these circumstances it would be possible to deposit the soot, electrically or in some part of the course of the air.

I like to point out that such a system would have several advantages. It would provide a persistent and efficient system of ventilation that would enable hot water or steam to be used advantageously much more generally than at present.

Ventilation of a domestic house under existing conditions is largely dependent upon its active chimneys, and treated accordingly. If one could rely upon the extraction of a definite quantity of air, it would be possible to modify the arrangement in various ways for the convenience of the household. To revert to my first suggestion, the sink waste pipe is one of the most useful of appliances, and a corresponding contrivance for the removal of smoke would be found after a little use to be serviceable—it might even replace the carbolic sheet for the isolation of inmates suspected of infectious disorder. At least among the advantages of such a system must be the facility it would afford for diminishing the smoke produced independently of the facilities for its removal after production. At the trials in connection with the Abatement Exhibition, South Kensington, the most successful results were obtained with grates that had what may be called downward draught, that is a draught that carried the smoke from the external coal through the fire. To manage that kind in an ordinary house requires special appliances, but with the provision of means for the constant removal of air, it would be easy to secure these most desirable conditions.

### Position of Local Authorities to the Solution of the Problem.

I proceed to consider the share which local authorities have in obtaining a solution of this problem. Hitherto they have been restricted to fining conspicuous offenders—for reasons which I need not now detail—the penalties for conspicuous failure is not effective; it is needed so long that we might now see whether it could be replaced advantageously by a system of rewards.

For the sake of definiteness I have set down the position of the local authority as equivalent to a tenpenny rate. It would not seem practicable for them to consider the same way as they do to the solution of the sewage problem, maintaining a single municipal system. They could contribute effectively by allowing a specific reduction of rates for properties within their area which were so situated as not to add to the pollution of the atmosphere by

the questions which I have mentioned are to be asked, it is that they should be put in such a manner that the men of science may be encouraged to work out answers, and for that purpose they must make experiments, the practical applications of science on the large scale are very expensive, and the only way of doing them is to take care that they are remunerative to anybody if successful. In this matter the local authority could be of great assistance if they were willing to rate in what seems to me a reasonable manner. The incidence of rating is such as to discourage all of this kind. If an enterprising architect were to design buildings and provide it with means of deliver-

ing its used air free of smoke at an outlay of, say, 1,000*l.*, with an annual cost of 25*l.* for maintenance, I presume the local authority would reward him for his public spirit by increasing the rateable value of the property on account of the outlay, and thus fine the owner some considerable sum per annum for his rash enterprise. The owner would also be placed in the unfortunate position that whereas by avoiding smoke he had conferred as much benefit upon all his neighbours as upon himself, he would have to pay the whole fine of increased rating himself, and would still have all the disadvantages of his neighbours' smoke.

I would suggest that instead of pursuing so unreasonable a course, the local authorities might recognise public spirit of this kind by reducing the assessment of a property that, to the satisfaction of its neighbours as well as of a surveyor or inspector, produced no smoke, so that the rates upon such a property should be decreased by, say, 6*d.* or 1*s.* in the pound instead of being increased. This would afford direct encouragement to practical men of science to design and keep in action means for the prevention of smoke, and would lead to gradual improvement.

In a question which has assumed the proportions of the problem of smoke disposal in our large towns, the possibility of gradual improvement is a very important matter. The suggested action of the local authorities would tend in this direction for two reasons. In the early stages the reduction in the rate would be practically a bounty to those who were willing to make the experiment of effective smoke prevention. It would be a legitimate bounty because in the earlier stages, assuming that the local authority itself initiated no appliances, the experimenters would bear the expense, though they would not derive any special benefit themselves, and would still suffer from their neighbours' smoke. Every fresh adherent would, however, diminish the effective amount of the bounty and also the general pollution of the atmosphere until in the end the distribution of rates would have reverted to its original figure, but on the other hand each householder would have been freed from the disadvantages of his neighbours' smoke.

It would naturally appeal with the greatest force in those quarters where rateable value is high and the advantage of open fires relatively small, and in such places it would be really worth while for practical men to make a serious effort to qualify for the reduction of rate. In the City of London, for example, there must be many properties with very high rateable value, whose facilities for contributing smoky air are already limited to one hot-water furnace and a few open fires. For such establishments it would be an experiment on a very small scale to arrange matters to obviate smoke altogether, and satisfy the surveyor or inspector that the property was smokeless and thus secure the reduction of rate. There might be some difficulty at first in establishing a qualification, but it could not be greater than the difficulty of establishing a right to a Parliamentary vote. In the course of time the smoke producers would be a few exceptional persons paying exceptionally high rates, a very rational state of affairs; and when the City of London had by the gradual extension of such experiments freed itself from its own smoke, I think we might safely rely upon the citizens to take care that the indirect economies to which they would be legitimately entitled by their public spirit were not destroyed by the unrestricted smoke production of the surrounding boroughs.

I have made the system of the general collection of smoke by mechanical means for the purpose of treatment the basis of my remarks, but I have already disclaimed any desire for exclusive privileges for that particular form of experiment in the purification of smoky air. If it be feasible on the commercial scale it has the advantage in an especial manner of making successive improvements possible. The smoky air of London is injurious, not only on account of its visible soot, but also on account of the sulphurous acid and other invisible products of combustion which accompany the soot in the first instance. If it be found possible in the first place to deposit the soot particles, attention might next be turned to some means of dealing with the noxious acid fumes, at least, in those cases where they are specially abundant.

In setting down an estimate of the cost of the system as equivalent to a rate, I fear I may alarm some overburdened ratepayers. I therefore hasten to point out that I am not suggesting that the local authorities should levy an additional rate in order that they may experiment upon the mitigation of the smoke nuisance, nor indeed that they should necessarily levy any additional rate at all. Of course if addition is made to the domestic appliances of houses, the householders will, somehow or other, have to pay for them, and, therefore, when the system became complete, the distribution of cost would probably become assimilated to the distribution of rateable charges. But in the early stages it would be sufficient to encourage private and voluntary enterprise by the reduction of rates in the few cases where a qualification could be established, and the additional burden thus thrown upon the large majority of ratepayers not sharing in the direct cost of

\* Read before the Congress of the Sanitary Institute by Mr. H. W. Haw, M.A., Sc.D., F.R.S.

the experiments for the good of the community would be unimportant.

Such a system would thus be, in the first instance, a direct encouragement to progressive experiments, and in the end would enlist the active support of all those possessing arrangements for avoiding smoke in favour of effective compulsion for those who had not.

To put the questions I have indicated to men of science in this way would be merely a matter of business, and, if the questions were so put, I venture to express the confident opinion that the science of the twentieth century would give as satisfactory an answer to the question of the treatment of smoke as the science of the nineteenth has given to the question of the treatment of sewage.

### WEST HARLING CHURCH RESTORATION.

THE parish church of West Harling, a pretty village some seven miles from Thetford, and a little over two from Harling Road station, has just undergone a thorough restoration.

The work just completed comprises the entire renewal of all the roofs in English oak. The nave and porch are open-timbered, constructed on the lines of existing examples. The chancel roof is panelled beneath its timbers, and at the intersection of the mouldings are carved bosses. Externally, the roofs are covered with red hand-made flat tiles. The whole of the wrought stonework has been cleaned of whitewash, and its original surface exposed. As little new stone as possible has been inserted, and all tool-marks of the early masons have been jealously preserved. The walls have been underpinned and strengthened where necessary. The windows have been re-glazed, every piece of early glass being preserved. The warming is effected by one of Bradley's underfloor stoves. In the new reredos are embodied some interesting fifteenth-century carved panels, probably of Flemish workmanship, illustrating the early life of Our Lord.

During the work of restoration the lower stonework, more particularly of the transept and chancel, when exposed, bore decided traces of fire, but there appears no record existing of a conflagration. Most of the old stonework dates back to the thirteenth century, while in the nave the lower parts of the walls are very much earlier in date. In the nave an old stone staircase leading to the rood-loft, no longer in existence, was exposed and left. This is fourteenth-century work, and quite perfect, and traces of the iron fastenings for the door are seen. A piscina in fairly good order was found on the south side of the nave, also an archway, which formed part of the lady chapel, removed in 1730. The piscina appears to have served both for the church and the lady chapel. A doorway was discovered leading from the churchyard into the chancel on the south side, and several old windows have been exposed, including a lancet window opening from the church into the vestry, which was originally a mausoleum for the Crofte family. An aumbrey, double piscina and several sedilia have also been exposed, and some old stencilling, which has also been preserved. A very handsome new reredos has been erected, the frame being of oak, and the panels, five in number, of very old oak, illustrating the Birth of Christ, the Wise Men, the Annunciation, the Presentation in the Temple, and Christ before Pilate. The new roof has been raised to a good height, and in the chancel there are carved bosses in the intersection of the mouldings.

### THE INTERNATIONAL ART EXHIBITION, VENICE, 1903.

THE Municipality of Venice has opened a competition among Italian and foreign artists for the best design, modelled, for a large gold medal to be awarded to the most important works shown at the International Art Exhibition of 1903. The medal must bear on the obverse an allegorical figure of Venice and her artistic glories, surrounded by the inscription, "La Esposizione Internazionale d'Arte della Città di Venezia, 1903," and on the reverse side the words, "Gran Premio della Città di Venezia," leaving a blank for the name of the successful competitor, the whole to be surrounded by an ornamental border. Every competitor must send in the models of the obverse and reverse sides of the medal executed in either wax or plaster, the models must have a diameter of exactly 120 mm., and the competitors must send, together with the models, the respective photographic reproductions measuring 40 mm. in diameter, which will be the dimensions of the medal. The Municipality of Venice has allotted a prize of 3,000 lire to be awarded to the author of the model judged the most deserving of reproduction, and judgment will be given by a commission composed of the Mayor of Venice, president of the exhibition, the general secretary and three artists. The

models for competition must reach the office of the exhibition (Municipio di Venezia), post-paid, not later than January 31, 1903, and must be signed with a motto must also be written on a sealed envelope containing full name and address of the competitor.

### THE PROVISION AND CONSTRUCTION OF SANATORIA FOR TUBERCULOSIS.

IT is only possible in the limited time at my disposal of this interesting subject in a very sketchy manner. Many excellent sanatoria of Germany have done much for the cure of consumption, but it is advisable that there should be an extension of the same system at home in words, the establishment and maintenance of British sanatoria for British patients. No less an authority than Dr. A. C. S. has said:—There are many places in this country on a dry soil and in a sunny sheltered part on the south slope of some upland, most of the conditions can be obtained, which are now dearly bought and far sought, and the results obtained, in distant parts of the world. If they were adequately provided for the treatment of tuberculous cases, we do for all varieties of infectious fever, for the insane, and the insane, it is better that we should do so, rather than be obliged to send such cases far away in search of the possibilities of this cure "at home" should be open to the very poor as well as to the rich. Though sites of the kind of many of the continental sanatoria are not available, it is not everything, provided the principal requirements of a sanatorium and shelter be complied with.

Out of twelve British sanatoria for paying patients, three are at a greater altitude than 400 feet above sea-level, and good results are recorded at all of them. In the larger sanatoria large wards are not desirable, but a liberal provision of single bedrooms for the patient and the avoidance of the extravagance which the provision of single rooms would entail, it is well to have a few small wards for two or six beds each. The six-bed ward is about as large as can be found desirable.

Open balconies at the upper floor levels in front of the room windows, which should in all cases open down to the floor, are better than verandahs in front of the ground-floor windows; they need not be more than 4 feet in projection from the wall, as this is ample to allow of the bed or couch being laid longitudinally thereon, if the patient be too weak for outdoor exercise. The balcony is much more "airy" than a covered verandah—unless the latter can be arranged to open after the manner of those at Ruppertsheim in Germany, where they are lateral extensions to the east and west of the building, and, of course, offer no obstruction to the circulation of light and air. But of more importance is the ample provision of small shelters in the grounds at a reasonable distance from the building. These compel patients to enjoy a little walking exercise, and induce them to indulge fully in the "open-air" treatment, and these should be so arranged as to screen the occupants from the winds.

Large and well-lighted, cheerful and bright sitting-rooms should be provided, for though the "open-air" treatment is the chief object of the sanatorium, there are times when a little social intercourse amongst the patients is advantageously beneficial. Due attention, of course, must be paid to the upholstery of furniture, and the entire absence of heavy carpets and tapestry curtains.

The dining-hall should likewise be as light and cheerful as possible, and it is of great importance that it should be completely isolated from all other parts of the hospital, and equally so by means of a well-ventilated corridor from the kitchen. The kitchen should be lofty and well ventilated at the roof, rooms, of course, being placed over it.

Special attention should be paid to the proper planning of the sanitary adjuncts. The baths and water-closets should be placed in turrets, in themselves well ventilated, and should be completely isolated by means of cross-ventilated connecting corridors, entirely detaching them from the main building.

The further adjuncts of a well-planned and equipped sanatorium will readily suggest themselves, such as ample provision of patients' clothes stores, where garments not in general use can be put away, thus relieving the bedrooms of superfluous furniture, of which the less there is the better; bedrooms and boot-cleaning rooms are likewise useful accessories, and of course, in addition to the nurses' duty-rooms, servants' rooms must be provided, where the sundry domestic articles for cleaning, &c., can be kept.

In addition there are the thousand and one small details which will naturally suggest themselves to the skilled architect.

\* Abstract of a paper by W. Cecil Hardisty, read at the Congress of the Sanitary Institute at Manchester.

which cannot be dealt with in a short paper such as this, which will require their due and proper consideration. Nurses and domestic servants should be provided for in some little distance from the main building, for much attention is given to the healthy housing of the patients, no less care should be devoted to the homeliness and comfort of those upon whom devolves so much responsibility in the success or otherwise of the treatment prescribed. It should be remembered that the short walk from the one building to the other ensures an entire isolation from the atmosphere of the hospital, a veritable going "off duty," and a retirement for a while to the quiet and restfulness of home life. As in the sanatorium in the nurses' home, let brightness, cheerfulness and comfort be the keynote, and let all be done for the health and comfort of those upon whose strength and vigour depends the success of the treatment.

These conditions be carried out thoroughly, let us hope that the not far distant future it may be superfluous for this body to discuss the question upon which it has been called upon to address you.

## TESSERÆ.

### Qualities of Sculpture.

It may be described as that appropriate action or manner which displays beauty in its fullest degree, and from it all that is opposed to the impression it should produce. Animals are at all times graceful in their different motions because their motions are perfectly unrestrained, and adapted to the occasion; but in man grace is dependent upon inward restraining or governing of the body by the mind, guided by a certain inherent sense of the propriety of the action, which prevents in it the occurrence of awkward movements, or attitudes, and imparts to it at the same time the grace of its own inward sentiments or feelings; so it is that of art, whether considered as to their design or execution. An expression may be carried out in sculpture so thoroughly intelligible, a story may be told with force, and the means be not judiciously chosen, the attitudes as well as effective, the artist has not properly used the resources of his art; he has only copied, not selected. Grace, in sculpture, implies elegant variety of line, tasteful and judicious subordination of parts, delicate finish and appropriate workmanship corresponding in its style with the character of the entire design and aiding it in its effect. Grace is a false grace particularly to be avoided in sculpture, which arises from the action of the figure emanating, not from involuntary emotion of the heart, or from a sudden impulse, but from a vain desire to display the figure in its form. The movements caused by affectation are exaggerations of those lines of grace created by the influence of natural influences. Dancing, so far as it is concerned with joy and mirth and exhibits the effect of a flow of grace, but when studied for the display of the figure becomes affectation. Theatrical is a term applied to art when the expression is too powerful for the cause which it is derived, or the action too violent for its purpose, when the figure or group appears anxious to display others its action or emotion. Whenever strong and powerful movement is portrayed in sculpture it should be clearly defined and be of corresponding strength, and should say, be of still greater strength, for the outward effect of feeling as shown in the features and limbs is but a reflection from a shock received in a system passively and, like the rippling rings in the water, must be seen to further it recedes from its central or primary

### The Burgh of Mousa.

The Valley of Glenelg and in the Shetland Isles are the seats of several conical buildings, which are merely places of refuge without any means of assailing an enemy. The most famous of these is one in Shetland, well described by Dr. Hibbert in the Burgh of Mousa, and is situated close to the sea. It is most ingeniously contrived for mere security. The building is double and constructed of rude stones without mortar, and built in two concentric circles, each from 4 to 5 feet thick, with a vacancy between them of 5 feet. The distance from the out to the inside is 15 feet at the widest part. The two walls are united by long and broad stones which tie them together. These stones are so placed as to rise to the first platform, and are continued half round the building on a flat or horizontal line, so as to form a continuous platform between the walls, when the stair is again resumed to the second platform, and the gallery again formed half round in the same manner the stairs and galleries are continued to the top of the structure. The diameter of the building at the base is 150 feet, the height 42 feet, and the building is erected on a circular form like a glass-house, but towards the top it

leaves the conical shape, bulges out, and is carried up in rather a perpendicular line. This stronghold was quite open at the top, the galleries having each a square opening to the interior by way of window, served as chambers to the inmates, as high up in the building as the distance of the two walls would admit, for they gradually approached till they joined at the top; at the same time, the stairs and galleries bound the walls from top to bottom. There was no window on the outside. The only entrance was a low door through the outward wall only, then a passage led half round the base between the two walls, and an opening or door through the second wall (thus placed opposite the outward door) gave admittance into the interior open area. It was impossible to scale the building from its peculiar construction. If the only doorway was well blocked up by large stones, no entrance could be made; but if made, the inhabitants in the galleries could shower down stones upon the assailants.

### Engraving and Painting.

An engraving bears somewhat the same relation to a picture that a play read does to a play acted. It does justice to the intellect of the artist, but not to the power, splendour and magnificence of the art. No picture, the effect of which is wholly lost in a good engraving, can afford a real gratification or deserve to rank with the works of dignified art. It is a motionless spectacle, a painted melodrama, but neither tragedy, comedy, history nor good broad farce. Engraving cannot, indeed, bewitch the eye with colour, but it can give the most delicate gradations, combinations and interchanges of light and shade. The pleasure of colour is more in the sense than in the mind—the utmost skill in mere colouring only makes the painter a rival if he be not a rather humble imitator of the velvet manufacturer. Engraving, too, partakes of the ubiquity and reproductive power of printing. It enables many who can never visit the Vatican to satisfy themselves that the fame of Raphael and Buonarrotti is not a vain sound; and it will bear testimony to their glories if the works of their hands be doomed to perish like those of Apelles. Engraving, in fine, puts the enjoyment of art within the compass of moderate incomes, and fills up little room in a moderate mansion; therefore it brings art within the range of popular sympathy.

### Unfading Green Slates.

SIR,—In view of our having repeatedly had occasion to explain to architects and others our necessity for being unable to accept orders for "Eureka" slates excepting at higher prices than those we quoted when estimates were being prepared, we should greatly esteem if you would permit us, through your columns, to state that owing to the present "boom" in the United States prices of all slates there have gone up by leaps and bounds, including the prices charged by the "Eureka" Quarries. We have, in fact, having in mind the stocks we hold, not found it necessary at present to put on even the full advance charged by the quarries; and we trust that if your courtesy permits of the insertion of this letter, it will serve to assure both architects and contractors that the somewhat increased cost per square we now quote is caused by the rise in the quarry list price, and for no other reason whatsoever.

We need hardly add that orders placed with and accepted by us before the rise was advised are executed at old prices.—Yours obediently,

ROBERTS, ADLARD & CO.

September 12, 1902.

### Fireproof Wood.

SIR,—Your interesting extract in the issue of the 5th inst. from the *New York Times*, giving an account of tests with fireproof wood, shows a strange misconception on the part of the experimenters with the uses and purposes of this material. It appears that they subjected the fireproof wood to a temperature of 3,500 degs. Fahr. This, as every one knows, is a temperature which readily melts steel; it could, therefore, be only natural that the fireproof wood was reduced to carbon in almost the same time as the ordinary wood. A test of this kind is not only of no practical value, but tends to mislead persons unfamiliar with the material.

The object of fireproof wood is to prevent fires occurring at all. Wood is practically the only building material from which there is any danger as regards fire. Iron, concrete, brick, stone, glass, slate and other building materials in common use are perfectly safe from catching fire. It is wood and wood only that gets alight, forms fuel and spreads flame. A proper test of fireproof wood is to suspend two boards (one treated and the other not), say 6 feet long, 6 inches wide and 1 inch thick,

in a fire. In a minute or so the untreated board will have caught fire, and the flames will be spreading. In 7 or 8 minutes the untreated board will be totally consumed by its own flame. The fireproofed wood board, on the contrary, will be only slightly charred at the point where it is in contact with the fire. To destroy it by the same fire that consumed the untreated board would take instead of 8 minutes nearer 8 hours carbonising, because such could only be done little by little, inasmuch as there is no spreading of the flame.

It is really astonishing how little is known among architects of the extraordinary importance of fireproof wood. They do not seem to grasp the idea that now for the first time in the history of the world a building may be rendered truly fireproof and not sham fireproof as heretofore.

The following extracts from a letter written by Mr. L. Benoist, the distinguished chief of the Montreal Fire Brigade, after thorough tests of fireproof wood, show that practical men who have daily to fight fire are beginning to realise the capabilities of fireproof wood:—

“Montreal Fire Department,

“Montreal: May 20, 1902.

“Dear Sir,—Having investigated very carefully the process you employ in rendering wood fireproof at your factory at Cole, St. Pauli, also having made personal tests of the wood so treated, I have no hesitation in recommending it very strongly for use in buildings of every description, and more especially for public buildings and institutions.

“I am thoroughly convinced that any building having all the woodwork treated by the fire-resisting chemicals which you use cannot be destroyed by fire.

“I would state as the result of my investigations that I have come to the conclusion that where the contents or stock of a large ware-room or building should take fire, and should the woodwork be treated with your process, the risks to the lives of firemen in performing their duties would be materially lessened, and they would be greatly assisted in saving the contents and human lives in such a building, owing to the absence of smoke from the woodwork.

“I might also add that nothing during my experience—covering as it does nearly a quarter of a century—has so appealed to me as the fear which is unconsciously brought home to the average fireman when a fire occurs in what is termed a modern fireproof building.

“The fireman at once realises ‘fireproof’ usually means a steel-constructed building of steel beams, girders, &c., which under intense heat usually collapses, and he is caught like a rat in a trap; whereas, if the steel girders, beams, &c., were encased with fireproof wood he would be safe, for the reason that the heat could not penetrate the wood fireproofed by your process.

“I firmly believe that fireproofed wood is destined to become the most valuable feature in the construction of modern buildings, and it is at the present time really impossible to conscientiously estimate its great value and public worth.—Very respectfully yours,

“(Signed) L. BENOIST, Chief Montreal Fire Brigade.”

Hoping that the above will serve to dispel the prevailing misconceptions regarding this valuable material.—Yours faithfully,

W. C. DICKENSON.

22 Hereford Square, South Kensington, S.W.:

September 13, 1902.

## GENERAL.

**The Duke of Argyll** has appealed for 3,000*l.* or 4,000*l.* for the reparation of the Castle of Dunstaffnage, where the Coronation-stone was kept for centuries.

**The Royal Society of Antiquaries of Ireland** will hold their quarterly meeting in the Tholsel, Kilkenny, on October 7. After the business has terminated, places of interest in the city will be visited. Excursions have been organised for the following day.

**Mr. William Frederick Fairrell, M.I.C.E.**, of Sandhurst, Tunbridge Wells, who died on July 3, has left property valued at 135,900*l.* 15*s.* 8*d.*

**The Westminster Construction Company's** tender has been accepted for the new pumping station to be erected near the North Railway jetty in Portsmouth Dockyard.

**The Abbé Delapart**, the eminent French archæologist, recently died at Tebessa. His labours were chiefly confined to Algeria, where he worked for forty years.

**The Southend Technical School**, which provides accommodation for 375 students and has been built by the Town Council at a cost of 20,000*l.*, towards which the Essex County Council has contributed 5,000*l.*, was opened on Saturday. The building was erected according to the design of Mr. H. T. Hare.

**The Portsmouth School Board** have decided to borrow 4,513*l.* for the improvement of Kent Street school.

**The British Association** will meet at Southport under the presidency of Sir J. Norman Lockyer. The proceedings will open on September 9. Cambridge is expected to be the venue for the following year's congress.

**The London and South-Western Railway** have intimated to the Kingston-on-Thames Union their acceptance of a net assessment of 128,000*l.* for property situated within the union, which extends from Wimbledon to Hampton, and includes those parishes of Kingston, Teddington, Surbiton, Esher and Dorking. The new assessment represents an increase of over that of ten years ago, when the railways were laid out.

**Mr. Waterhouse, R.A.**, continues to make progress in the recovery of his health. He is at frequent drives in the neighbourhood of his house, at Court, near Newbury.

**The Paris Municipality** and the Seine General Council are shortly to commence the erection of a school of arts and crafts. A site has been chosen in the Boulevard de Haussmann. The cost will be 5,000,000 francs, of which the State will contribute one-fourth.

**The Brighton Corporation** propose to seek powers in the next session of Parliament for the construction of the tramway, which are estimated to cost 37,156*l.*

**The School of Photo-Engraving and Lithography** of the London County Council will be opened on September 29 for its eighth session.

**The National Gallery of Ireland** has been enriched by the following purchases during the past year:—*A Boy with Angels*, by Lorenzo di Credi (250*l.*); *Portrait of David*, eleventh Earl of Buchan, by Raeburn (100*l.*); *Solitude*, by Richard Wilson (120*l.*); portrait of a nobleman by Morland (50*l.*); and *The Virgin and St. Joseph with the Infant Christ*, by Lorenzo Costa (1,250*l.*). A great number of drawings and studies by the late Sir F. W. Burton, number of portraits in chalk, pencil and mezzotint, and engravings were also acquired. Among the donations received were a portrait of John Philpot Curran, by Sir Thomas Lawrence, presented by Lord Iveagh; and a portrait of Frederic W. Burton, R.H.A., by H. T. Wells, R.A., presented by Mr. H. T. Wells.

**The Autumn Exhibition** in the Walker Art Gallery, Liverpool, under municipal auspices, was formally opened on Saturday. Eight rooms and a stairway are devoted to the display of oil-paintings, water-colour drawings, miniatures, sculpture, art jewellery, metalwork and pottery, the number of exhibits being nearly 1,600, of which a great number are pictures.

**Mr. Thomas M. Rickman**, of 8 Montague Street, Russell Square, informs us that he has taken Mr. E. J. Burr, his assistant, into partnership, and the firm in future will be known as Rickman & Burr.

**The Northern Architectural Association** will hold their excursion meeting at Newcastle to-morrow (Saturday). The new buildings in Dean Street and Collingwood Street will be visited.

**The Premises** required for the enlargement of the Victoria Station (L.B. & S.C.R.) are now almost removed, and the site is ready for the new works. It is expected that the cost will amount to about two millions sterling.

**The French National Library** has acquired a papyrus believed to be unique. It is of the Græco-Alexandrian epoch, probably of the first century of our era. The papyrus is a fragment of a romance, and the text is adorned with illustrations. This is said to be the first illustrated literary papyrus discovered.

**The Secretary of Scotland** has appointed a committee to inquire into the constitution, powers and duties of the Board of Manufactures, with special reference to the administration of the grants made by Parliament for purposes of agricultural improvement, and to report whether, and in what way such administration may be improved. Mr. Akers-Douglas will act as chairman, and Mr. Ewan F. Macpherson as secretary to the committee.

**The Central South African Railways Authorities** have placed an order in England during the past week for 104 carriages, 38 engines and 250 steel coal trucks, valued at 80,000*l.* capacity.

**Mr. Sidney Paget** is engaged in painting a portrait of John Aird, M.P., the mayor of Paddington, which is to be presented to Sir John in the name of the Borough Council on his retirement from the mayoralty in November.

**The Italian Government** have had a plan prepared for the reconstruction of the Campanile of Venice at an estimated cost of 2,000,000*l.* It will be erected on the site of the old one, but will be modified at the upper part.

## EDITORIAL NOTICES.

*view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.*

*Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.*

*Authors of signed articles and papers read in public must necessarily be held responsible for their contents.*

*Communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.*

*Respondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.*

## TENDERS, ETC.

*As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

## COMPETITIONS OPEN.

**BIDEFORD.**—Sept. 25.—The Town Council of Bideford are it to erect municipal offices and a public library upon a opposite the west end of the Long Bridge, Bideford, and invite designs for the proposed buildings. VOLUME LXVII. OF THE ARCHITECT

Handsomely bound in Cloth, Gilt Lettered, 12s. 6d.

Office: Imperial Buildings, Ludgate Circus, E.C.

WALES—Oct. 6.—For erection of latrines, &c., at the Froedrhigwair school. Messrs. James & Morgan, architects, Cardiff.

WALLSEND.—Sept. 27.—For extension of the Carville junior school and caretaker's house, Wallsend. Clerk of the Board, Bewicke Schools, Willington Quay, R.S.O.

WESHAM.—Sept. 30.—For erection of workhouse and offices at Wesham, Lancs. Messrs. Haywood & Harrison, architects, Accrington.

WHITECHAPEL.—Sept. 22.—For erection of stores, cart and sheds, lodge and public urinals at the dépôt in Wentworth Street. Mr. G. W. Clarke, town clerk, 15 Great Alie Street, Whitechapel, E.

WIGAN.—Sept. 24.—For erection of an engine-shed, &c., and widening of bridge at Wigan, for the Lancashire and Yorkshire Railway Company. Mr. R. C. Irwin, secretary, Hunt's Bank, Manchester.

CITY SUBWAYS REGULATIONS.

WITH a view to obviating the constant disturbance of the street traffic, the Corporation has drawn up a number of by-laws which will shortly come into force. In future a company wishing to bring a pipe or wire (other than a service pipe or wire) into a subway must give in writing fourteen days' notice to the Corporation, together with information as to the insulation and the highest electric motive force for which they may be used. Three days before any company can place a service pipe or wire into a subway, notice must be given to the city engineer. Fourteen days' notice must be given by any company of its intention to remove any pipe or wire. In the case of repairs three days' notice will be necessary. No work involving the alteration or reconstruction of any part of a subway will be permitted until the expiration of forty-eight hours after notice has been given to the owner of any pipe or wire in the subway. All companies owning pipes or wires must, within six months of the confirmation of the by-laws, deposit with the Corporation full particulars of their pipes and wires, and in the event of any company failing to carry out the by-laws or supplying incorrect information, it will be liable to a fine of 5*l*., and to a further penalty of 40*s*. for each day during which the offence is continued. Appended to the by-laws is a scale of fees for the execution of certain works in the subways.

TENDERS.

ARMLEY.

For providing and fixing about 85 lineal yards of wrought-iron railings and two gates at the Hill Top recreation ground. J. & H. SMITH, LTD., New Briggate, Leeds (accepted) . . . . . £42 1 3

## TRADE NOTES.

A Cambridge quarter-chime clock has been fixed at the parish church, Cumberland, by Messrs. W. Potts & Sons. Messrs. Potts & Sons have also received an order to make and fix a church clock at the ancient parish church, Askrigg, Leydale, Yorks, as a memorial to H.M. the late Queen Victoria.

MESSRS. ALFRED GRINDROD & CO., heating and ventilating engineers, of West Street, Sheffield, have recently fixed a hot-water heating apparatus into the greenhouses at The Grange, Sandgate, near Sheffield, for Barber; into the offices of Messrs. Charles Kirkby & Rundel Street, Sheffield; and into Beetwell works and Chesterfield, for Messrs. John Harrison & Son; and the firm have also fitted their high-pressure improved stoves into the offices of Mr. Fred. Cartwright, Sheffield; the new showrooms and warehouses in Bramall Lane, and, for the Exchange Furnishing Company.

## ELECTRIC NOTES.

Bridlington Town Council is applying for sanction to £25,000 for electric-lighting purposes.

The Hythe Town Council have arranged for the introduction of the electric light into the borough.

CKMONDWIKE has received official sanction to borrow for additional electricity purposes.

The Corporation of Brighton are holding an electrical exhibition at the Aquarium; the whole of the available space is booked up.

The Local Government Board's sanction has been obtained for borrowing of £8,478 for building and equipping a new electric-light station in Exeter.

The Monmouth Town Council has decided to extend the mains in Cinderhill Street some 500 yards, and to wire the court and jury room.

Several members of the Lowestoft Corporation visited Hampton on the 16th inst. and inspected the Lorain of electric traction.

MR. P. WHITE, Holyhead Urban District Council engineer, estimates the cost of the electric-lighting scheme of the town at 16,000l., with 750l. for emergencies. As a site for the electricity works some existing steam mills are to be bought for 3,000l., subject to Local Government Board approval.

FOR the new electric tramways at Bexley Heath, Kent, the tenders of the following firms have been accepted:—To supply and lay the cables, the Anchor Cable Company, 8,989l.; for the permanent-way construction, Messrs. J. G. White & Co., 13,829l.; for the overhead equipment, Messrs. Dick Kerr & Co., 4,723l.

## BUILDING AND BUILDERS.

A NEW church is about to be erected in London Road, Worcester.

THE building of a new Grand theatre has been commenced in Norwich.

THE foundation-stone has been laid of a new church at Mallaig, N.B.

HENRY BOWDEN, a steeplejack, of Oldham, fell from a chimney at Radcliffe, and was killed instantly.

THE Ecclesall guardians have appointed Messrs. Holmes & Watson architects to the proposed village homes, and instructed them to submit plans forthwith.

MESSRS. NEWCOMBE & NEWCOMBE, of Newcastle, have submitted to the guardians plans for the rebuilding of the workhouse at a cost of 52,000l. and these have been accepted.

MR. ERIC SUTHERLAND'S (96 Renfield Street, Glasgow) plans for the erection of halls to be used for Sunday-school and other Church work at Larkhall, N.B., have been accepted.

THE Board of Education has sanctioned the loan of 15,641l. for the erection of new schools on the Lodge estate, West Bromwich, and the work is to be commenced forthwith.

AT Sharrow Vale, Sheffield, the foundation-stone of a new chapel has been laid (belonging to the Wesleyan Reform chapel), which is estimated to cost 2,750l.

MR. J. A. SOUTAR is the architect for the reconstruction of the laundry about to be erected at Radcliffe Infirmary, Oxford.

FOUNDATION-STONES of a new Congregational church were laid at Llangollen recently. The new building will cost over 3,000l., towards which sum over 700l. is in hand.

Invited to inspect the Safe Deposit, which is open free from 9 a.m. to 6 p.m. Descriptive Prospectus and full particulars may be obtained from E. Vincent Evans, Manager and Secretary, 63-64 Chancery Lane, London, W.C.

THE architect for the alterations and additions which are at the present time being carried out at the Royal Pavilion hotel, Woolwich, is Mr. Herbert Riches, of 3 Crooked Lane, London, E.C.

A SCAFFOLD accident occurred on Monday morning at Carlisle Citadel station, by which three workmen sustained injuries so severe that they had to be removed to the Cumberland Infirmary.

It is expected that within a short time the work of restoring the ancient chapel of St. Nicholas in Carisbrooke Castle, Isle of Wight, as a memorial to Charles I. will be commenced. The plans have been approved by the Government department responsible for the care of historic buildings.

THE foundation-stones of a new Primitive Methodist Sunday school in Leigh Road, Leigh, Lancs, were laid on the 13th inst. The chapel, which has been in course of erection for some time, and the Sunday school, which will accommodate 700 scholars, will cost about 7,500*l*.

ON the 13th inst. the memorial-stone of the new Established church for Dalmaur, N.B., was laid by Colonel Denny, M.P., provincial grand master of Dumbartonshire. The church is designed in a free treatment of Perpendicular Gothic, and will cost about 5,000*l*. It will have accommodation for about 800 worshippers.

A NEW church is to be erected at Sparkhill, Birmingham, the suggested name of which is St. Giles's, Springfield. The scheme is somewhat immature at present. No plans are prepared, the only definite facts that may be stated are the absolute necessity of the building and its situation. It will stand on half an acre of land in a conveniently central position at the terminus of the Sparkhill tramway route. The actual site is at the corner of Walford Road and Springfield Road, opposite the new College Road Board schools.

A TERRIBLE accident occurred on Tuesday afternoon to a party of seven joiners who were engaged on the construction of a cooling tank at the large new electricity generating station of the South Lancashire Tramways Company at Atherton, near Bolton. The men were working on a timber staging 38 feet high, and whilst moving a derrick crane an accident occurred which caused the collapse of the scaffold, precipitating the men into a concrete bed 44 feet below. George Pearce, twenty-two, single, Liverpool, was picked up dead, and of five removed to the Bolton Infirmary two died almost immediately. Only one man escaped.

THE London County Council housing of the working classes committee held a special meeting on the 16th inst., when the report of the architect, presenting working drawings, specifications, &c., regarding the blocks of dwellings to be erected on the Clerkenwell Road and Leather Lane frontages of the Reid's Brewery estate was considered. A statement was made by the chairman of the action taken by him during the recess. A letter was also read from the Home Office criticising the plans of the dwellings proposed to be erected by Lord Portman on the Nightingale Street area.

At a recent meeting of the St. Helens water committee the water engineer, Mr. J. J. Lackland, raised a point of interest to plumbers. A Bolton plumber applied for permission to do work at St. Helens and said he was prohibited by his operatives' society from employing a St. Helens man on the work. He had to send his own workmen. Mr. Lackland said the question was whether the water committee too were to be bound by the rules of the operatives' society. The matter was adjourned for inquiries, the chairman remarking, in answer to a question, that if a St. Helens plumber wished to do work in another town he would have to gain the necessary permission.

At a special meeting of the Barnsley School Board the result of the competition amongst local architects for the erection of a new higher elementary school was made known. Nine architects competed, and the Board were assisted in coming to a decision by the architectural adviser to the Leeds School Board. Mr. Ernest Dyson, of Kingstone Place, was the successful competitor, and his plans will be submitted to the Board of Education for final approval. The first prize of 25*l*. was won by Messrs. Dixon, the second of 15*l*. by Messrs. Crawshaw & Wilkinson, and the third of 10*l*. by Messrs. Moxon & Sons. The Board also decided to apply for powers to borrow 1,350*l*. for the erection of a temporary iron school, for use until the new school is completed, and for street making.

THE York City Council having applied to the Local Government Board for sanction to borrow the sum of 4,400*l*. for the extension of their Fever Hospital site, Huntington Road, an inquiry, directed by the Local Government Board, was held by Mr. R. W. Johnston, M.D., one of the Board's inspectors, in a committee-room at the Guildhall, York, on the 8th inst. The amount of 4,400*l*. was for the purchase of land from the Crown, and included 400*l*. for fencing. There was no opposition save

that of Dr. A. J. E. Parker, who objected on the ground that in cases of infectious diseases patients should not be sent to a large hospital if they could be attended at home, as the assemblage of many under one roof was liable to spread infection by the air, and of Mr. T. Wilson, an old ratepayer, who complained of the Corporation's continual borrowing. At the close of the inquiry the inspector visited the proposed site.

A SAD accident occurred on Friday afternoon at the Tay Bridge, Dundee. A number of painters were engaged on the structure painting the high girders. To do this they had to stand on a car which ran on rails. Boisterous weather prevailed, and the inspector, fearing that an accident might result, gave orders to the gang to cease work. This was done, but before the men had time to leave a terrible gust of wind struck the car, sending it with great speed along the line. Frantic efforts were made by the men to stop the vehicle, but without success, and the wheels leaving the metals the men were thrown off. Alexander Falconer and William Howie fell into the river 80 feet below and were lost, but the others saved themselves by catching hold of different parts of the bridge, and escaped with minor injuries.

BETWEEN three and four o'clock on the 15th inst. there was a very serious accident at the Carlisle Corporation gasworks. The roof of the retort house, which is over 60 yards long and about 30 or 40 yards broad, and was supported by iron girders, suddenly collapsed while about thirty men were employed in the building. Two men who were working on the top of the retorts were seriously injured. Robert Gilliland (who was one of those who was injured in an explosion at the gasworks about three years ago) fell, and a

large portion of the roof fell on and around him, breaking both his legs. A slate caught Archibald Turnbull on the head, and inflicted a long, gaping wound. Both the injured men were taken to the County Infirmary. It is supposed that the accident was caused by the heat of the retort ovens gradually eating the strength of the girders away. Recently a system of water gas was installed, and this, together with the present supply in the gasometers and the electric light, will be used for the lighting of the town.

AT the last meeting of the Burton Town Council a lengthy discussion took place on a report by Sir George Livesey on the subject of gasworks extension. The gas and electric-light committee unanimously recommended that the work as advised by Sir George be carried out at the estimated cost of 53,000*l.*, but that only one section be entered upon immediately at an outlay of 36,000*l.* This was eventually agreed to, an amendment to again defer the matter pending further and more detailed information being lost by nineteen votes to five. In the course of the debate it transpired that the gasworks during their existence had made 170,750*l.* profit, and of that sum 116,900*l.* had gone directly to the relief of the rates. The works had cost 192,000*l.*, and at the present time the mortgage upon them was only 43,000*l.* It was announced that Mr. Robert Ratcliff (Bass, Ratcliff & Gretton) had approved the plans for the Turkish baths which he is presenting to the town at a cost of 2,500*l.*, and it was decided to proceed with their erection forthwith.

## VARIETIES.

AT St. Michael's Church, Coppenhall, the new lady chapel was dedicated on Saturday afternoon.

AN addition which has been made to St. Stephen's schools, Elton, Bury, at a cost of 1,000*l.*, was opened on Saturday.

APPLICATIONS for the appointment of sanitary inspector to the Corporation of London will be considered on the 29th inst.; there are two vacancies.

AS an experiment the Halifax Rural District Council intend to treat the sewage of Norwood Green on the bacteriological system.

THE new school for infants, erected at Wednesfield by the Wednesfield School Board to accommodate 230 children, was opened on Tuesday last.

# CABOT'S INSULATING & DEAFENING QUILT.

## A PERFECT DEAFENER.

Prevents the transmission of sound through walls and floors by absorbing and breaking up the sound waves. The only deafener that does this. Send for Special Book on Schoolhouse Acoustics, illustrated.

## A SCIENTIFIC INSULATOR.

Contains innumerable minute dead-air spaces, giving highest insulating power. Warmer than back-plaster or six layers of rosin paper. Decay moth, and vermin-proof, and unflammable.

## FIREPROOF, DEADENING.

A fireproofing result infinitely superior to that obtained with sheet asbestos, and practically perfect sound-deadening, can be had in all kinds of buildings by using

THE London County Council are seeking an architectural assistant for the Housing of the Working Classes section of the Architectural Department. Applications must be made by 29th inst

MEMBERS of the Surveyors' Institution who are interested in the formation of a Masonic lodge, to be restricted to members only, are invited to communicate with Mr. T. H. Mellor, F.S.I., 1 Laurence Pountney Hill, Cannon Street, E.C.

GRAFTON SQUARE Congregational church, Clapham, was reopened on Sunday after being closed for several weeks for renovations, the cost of which, including alterations to church buildings, amounts to nearly 2,000l.

THE Temple Church, which has been closed during the Long Vacation, will be reopened for service on Sunday, October 5. During the Vacation the electric light has been reinstalled and considerably augmented.

ON Tuesday afternoon the new refrigerator which has been erected in connection with the city abattoir at the North Circular Road, Dublin, was formally opened by the Lord Mayor in the presence of a representative gathering of the citizens.

AFTER undergoing renovation, necessitating an expenditure of upwards of 700l, St. John's Church, Derby, was reopened for public worship on Sunday. The interior of this antique church now presents an exceedingly bright and cheerful appearance.

AT Southend on Saturday the Countess of Warwick formally opened the new technical schools which have been erected at the junction of the London Road and Victoria Avenue, from designs by Mr. H. T. Hare, F.R.I.B.A. The cost of the building, which forms a handsome and conspicuous block, has been about 20,000l.

THE exhibition of drawings executed by competitors in the recent municipal buildings competition was opened in the Co-operative Hall, Crewe, on the 16th inst., under the auspices of the Town Council. Forty-four sets of drawings were sent in, the first prize being awarded to Mr. Henry T. Hare, London. The second was divided between Messrs. Banister Fletcher & Son, London, Mr. Albert E. Dixon, of Leeds, and Messrs. Rodway & Denning, of Bristol.

THE Victorian Wesleyan Sunday and day schools in Grecian Crescent, Bolton, having become inadequate to the requirements of the district, were pulled down a year ago to make room for more commodious buildings, the memorial-stones of which were laid on October 12, 1901, and the new schools were formally opened on Saturday last.

DURING the height of the storm which raged at Walton-on-Thames on Friday last the stables belonging to the Urban District Council, situated at the Crutchfield Lane depôt, were struck by lightning and set on fire in two places. The ridge of the roof was demolished for a space of about 6 feet, the rafters were blackened, and in the centre of the building the electric fluid passed right through the roof and splintered one of the principals into matchwood.

WEST DEREHAM Church, Norfolk, was opened after restoration on the 11th inst. A new roof in pitch pine has been provided, and forms the chief feature of the restoration work. The walls and gables of the nave, which must have been in a dilapidated state, suffered considerably from the fall of the roof, which took place on April 25, 1901. These have been rebuilt. A new floor of Staffordshire tiles and wood blocks has been laid, and new seating in pitch pine erected in memory of a parishioner. A special apparatus for heating the building has also been installed. The total cost of the work amounts to about 850l. In addition to the work already undertaken, the tower remains to be repaired, the bells to be rehung and the tracery of the windows to be restored.

THE opening ceremony of the Lewin Road Baptist church, Streatham, S.W., took place on Saturday afternoon last, when the building was formally opened by the Mayor of Wandsworth. The building is of the Decorated Gothic period, and has a bold square tower and spire at one side. The facings are of red brick and the dressings of white Costessey work. The roof is of hammer-beam construction of open timberwork with boarded ceiling. The contract amount was 3,033l, exclusive of seating. The work has been carried out by Messrs. Johnson & Co., Wandsworth Common, from the designs and under the superintendence of Messrs. G. & R. P. Baines, architects, 5 Clement's Inn, Strand, W.C.

ST. JAMES'S HALL, Regent Street, has been subjected to a course of furnishing which amounts almost to a transformation, and the old gloomy scheme of decoration has given place to one which is bright and cheerful. The gallery and balcony fronts are picked out with light green and gold. The arch over

6-11 IMPERIAL BUILDINGS, LUDGATE CIRCUS, LONDON, E.C.

the orchestra is being decorated. New and roomy fauteuils have been provided, while the comfort of the gallery folks has been considered, and this portion of the house has been entirely resealed. A new system of ventilation has been adopted, and new windows have been fixed in light stained glass, ornamented with the names of eminent composers. The alterations, which have been in progress since last July, have been effected under the personal superintendence of Mr. Walter Emden, the architect.

THE urgently required restoration of St. Matthew's Church, Duddeston, has been carried out under the guidance of Mr. D. Arkell, architect, of Birmingham, and the reopening service was held on Sunday. The tower and spire have been repaired and strengthened, and the interior of the church has been improved. The system of gas-lighting is now effective, the north, south and west gallery fronts have raised decorations in the panels, the east wall has been specially treated, and the sanctuary screen has been continued round the north and south walls.

SOME interest has been excited in Southport by the announcement of the negotiations for the purchase of the Victoria Hotel vaults by the Corporation at 5,000*l.*, as a great public improvement will be effected by the purchase, and an opportunity afforded for dealing with the front on a much more extensive scale than has hitherto been the case. The present slope to the Lower Parade from Nevill Street will be filled up and a magnificent approach to the Promenade constructed. The ground close to the present bridge and the promenade adjoining the lake will also be placed on a higher elevation, and when the pier entrance is thrown back a fine large open square will be formed.

THE first annual report of the Stepney Borough Council has just been issued, and from it we learn that when the Council took office it took over three schemes under the Housing of the Working Classes Act, which were in progress in different parts of the borough. The first of these was what is known as the London Terrace scheme, St. George's, which was estimated to cost the defunct vestry of that parish the sum of 2,717*l.* The two other housing schemes were both in Limehouse, Queen Catherine Court, where the net cost of acquiring land was 5,574*l.*, and on which the Council is about to erect houses, and the King John's Court, where the net cost is estimated at 13,492*l.* Towards this, however, the London County Council have contributed 5,800*l.* In the matter of improvements the Council has been still more active,

THE new church at Twechar, N.B., was opened on Sunday. It occupies a position adjacent to Twechar school-house. The seating accommodation of the church is for 440 worshippers. The main entrance porch occupies, with the staircase, the ground floor of the tower. The heating is conducted from a heating chamber, situated in the basement, immediately under the chancel. The manse has its accommodation entirely on the ground floor, and consists of dining-room, study or parlour, three bedrooms, kitchen, scullery and wash-house and bathroom, together with a sufficiency of storage space. All the rooms are of ample dimensions. Both church and manse are fully lighted by electricity. The exterior design of the church is in the Early English Gothic style, tending towards the transition between this style and the Early Decorated style of Gothic work, and the manse, though more plainly designed, is still completely in harmony with the church. The whole edifice is built of Closeburn (Dumfriesshire) stone, which, in the case of the church, is dressed inside and out. The church has an open roof, designed to match the general style of the buildings. Arrangements have been made for the addition of a gallery should such extension of accommodation be rendered necessary by the increase of congregation. The grounds are enclosed in front by a wrought-iron railing of good design, surmounting a stone parapet wall which is pierced by two gates, while the lighting of the entrance is provided for by the placing of two pillar lamps just in front of the main gable.

A NEW police court was opened at Sparkhill, Birmingham, on Monday last. Sparkhill, says the *Birmingham Post*, has since October 1, 1899, been under the administration of the Worcestershire County Council. Soon after the Chief Constable of Worcestershire took charge of Sparkhill a police-station with cells was built on the Stratford Road, opposite the Women's Hospital. It was originally intended to add a court-house over the cells, but this part of the scheme was allowed to stand over for a time, and the entertainment hall of the Sparkhill Institute was used for the petty sessions as a temporary arrangement. The authorities having decided to provide accommodation at the police-station for five unmarried constables, the space over the cells has been utilised for the building of four bedrooms, a bath-room and a lavatory. A mess-room and kitchen have been provided on the ground floor. The court-house has been built behind the police station, with a carriage entrance and courtyard on the Stratford Road side, and a public entrance from Court Road.

**NORMAN & STACEY, Ltd.** DESIGNERS and DECORATORS,  
252, 253, 254, 255 & 256 TOTTENHAM COURT ROAD, W. (Oxford Street End).

On one side of the public entrance is a solicitors' room, and on the other a witnesses' waiting-room, with sanitary arrangements. Behind the Bench is a retiring-room and a lavatory for the magistrates, communicating with their private entrance. The court is a fairly large, lofty and well-lighted building, 45 feet by 27 feet. It is simply but suitably fitted up, the only feature calling for comment being the dock. This is very small, and it is placed against the wall, between one end of the Bench and the door leading to the courtyard and the cells. There is a seat for the dock officer, but it was evidently not made to hold the sergeant who was on duty when the court was opened. There is ample accommodation for the Press and the public. The low-pressure system is used for heating. The work has been carried out by Mr. Frank Davis, of Moseley, under the direction of Mr. A. B. Rowe (acting county surveyor) and Mr. E. T. Fletcher (clerk of works).

### THE SANITARY INSTITUTE HEALTH EXHIBITION.

FOLLOWING upon our notice in last week's issue of the above exhibition, which remains open at St. James's Hall, Manchester, until the 27th inst, we now proceed to give a few comments on some of the exhibits bearing more or less on the important subject of sanitation, and it is generally conceded that, taken altogether, the exhibition is one of a very instructive character, being on that account well worthy of a visit on the part of the vast numbers who are interested in matters relating to health, from both far and near.

Messrs. Doulton's exhibit embraces a large variety of sanitary fittings, and amongst the closets those for works and schools are especially noticable. One pattern consists of separate basins connected to one pipe fixed below ground level. They are flushed by an automatic tank, so that at one discharge the whole range is cleared. The action is syphonic and each basin is isolated. There is also a special low closet for children on the wash-down principle, with syphon cistern. These can be fitted with seat-action arrangement if desired. A syphonic closet, certain and quiet in action, with a good water area, as well as a new valve closet with open overflow, are also on view. For drainagework a new automatic syphon is shown. This will work with liquid sewage as well as clear water, and acts with drop-by-drop supply. The baths

are of different designs, and include both ordinary plunge as well as shower and spray fittings. They are all vitreous enamelled inside, and in one or two instances outside as well. This insures a perfectly smooth, glossy and lasting surface. Strong white-glazed fireclay is used for most of the lavatories, sinks, urinals, &c., and especially for those included for hospital use. It is strong, lasting, and has a smooth and well-glazed surface, and in many cases the ironwork used with it is vitreous enamelled, so that all exposed parts can be washed down. A mortuary-table attracts attention. The slab is 6 feet 6 inches long by 2 feet 6 inches wide, dished and deeply grooved to one end. It is fixed on a vitreous-enamelled centre column arranged to move on ball-bearings, so that the top can be easily turned to any angle, and then retained in that position by means of a simple check fitting. Another speciality is the sink for infectious hospitals. One pattern is worked by treadles, another by self-closing valves.

Messrs. Fletcher, Russell & Co., Ltd., of Warrington, clearly demonstrate the advantages of the "Hurst" patent pipe-joint, which has received a bronze medal award, for every class of pipes, &c., and connections. It can be fitted to baths, lavatories, sinks, kitchen and back boilers, as well as all kinds of taps, cisterns, mains, &c., wherever required, and should prove invaluable to water and gas companies, manufacturers, hydraulic engineers, shipbuilders and the general public. The same firm also show the rapid water-heater for baths, which comprises some novel features that are deserving at least of attention and worthy of a trial.

Mr. E. R. Palmer, Hygiene Works, Wickham Road, Beckenham, Stand 6, has an interesting exhibit consisting of automatic flushing syphons, automatic alternating apparatus for the distribution of sewage, and a ventilating column fitted with water fan, for which he obtained a bronze medal. This is an adaptation of mechanical ventilation or forced draught to the ordinary ventilating columns for sewers, and overcomes the weak point that has been hitherto such a strong argument against their use by the opponents of the system, by the atmosphere at certain times acting as a seal and preventing the gases escaping. In these columns an air fan is operated by a small water-wheel, which is driven by water taken from the main supply through a pipe passing up inside the base of the column, which extracts the foul air from the sewer, having a velocity of about 20,000 feet per hour through a 10-inch diameter up-shaft. The waste water from the fan can be used again for filling a flushing tank fitted with his

automatic syphon for flushing the sewer or for dissolving disinfectants. These flushing syphons are supplied to suit all systems for sewage purification and give a powerful flush with a certainty of action, but are specially useful when used in connection with the ventilating columns fitted with water-wheel, as the water after doing its duty there is conveyed into a storage tank which is periodically flushed out by the syphon, thus insuring a complete and continuous flushing of the sewer. These syphons are made in different patterns with outlets varying from 4 inches to 60 inches, the C pattern being designed to meet the difficulty of flushing shallow sewers, and are shown working satisfactorily in a flushing chamber with a depth of 12 inches only, with instantaneous action on a drop-by-drop supply. Pattern D is for flushing house drains and Pattern E for flushing drains without extra water, receiving waste water from baths and discharging with great force. They are specially suited for hospitals, asylums, &c. Alternating apparatus for the distribution of sewage can be attached to the outlet of these syphons. Mr. Palmer also exhibited other sanitary specialties, including patent trough channel with trap for receiving the ends of waste pipes from baths, sinks, &c.

*The Adamant and British Opal Wall-Glazing Co., Ltd.*, of Birmingham (Stand 51), are well to the front with their several specialties, including, in the first place, plastering waterproof cement, the merits and adaptability whereof are now pretty generally recognised. A satisfactory demonstration is afforded too of fireproof construction both as regards flooring and partitions, while "Britopal" is deserving of a more than ordinary share of attention, inasmuch as it is now extensively adopted as a substitute for glazing bricks or tiles by reason of its more artistic appearance and greater durability, added to the fact that the cost, we understand, compares in its favour.

*Messrs. Mather & Platt, Ltd.*, Salford Ironworks, Manchester, Stand 68.—This is a most important exhibit, consisting of the firm's specialties dealing with the purification of water, the treatment of sewage, water softening apparatus, fireproof doors, fire extinguisers, valves, hydrants, &c. The purification of water by means of Reeves's gravity filters (of which one is shown having a capacity of 125,000 gallons per twenty-four hours), and the treatment of sewage by automatic appliances, dealing with it from the outfall until it is distributed over the bacteria beds, we dealt with very fully in describing Messrs. Mather & Platt's exhibit at the last Glasgow Exhibition, but we briefly re-enumerate them, the subjects and their mode of treatment both being of sufficient importance to warrant it.

In the Reeves system for purifying river and well water for town supply and domestic purposes there are two forms of filters, the "compound" and "single-contact," operated by gravity or pressure. In the first the process of purification is effected by four distinct operations, namely, centrifugal separation, upward straining, aeration and downward filtration, the other by downward filtration only. The unfiltered water is taken through an automatic control valve into an annular separating chamber, and when it has filled this, rises through the primary filter, overflows through an inner chamber, and passes down to the finishing filter, and through screened nozzles at the bed of the filter, and then conveyed by pipes to the central duct, and thence to the outlet. The filtering medium consists of pure quartz crystals, which owing to their high specific gravity is not diminished by any portion of it being carried away with the water treated. The cleansing of the filters is a simple process, effected by reversing the flow of water, and requires a proportion of 1 in 400 only of the quantity passed through for filtration, and occupying from five to fifteen minutes to complete. These filters are in operation at many waterworks and private residences, hotels, &c., and have been adopted by many corporations with satisfactory results, as the analyses we have before us prove. In dealing with the subject of sewage purification, Messrs. Mather & Platt have set themselves the task of devising a means by which the bacteria beds shall be fed at regular intervals and in definite quantity, and that each bed should have regular intervals of rest and sufficient for them to recover before receiving the next discharge. This they secure in the following manner:—When the sewage or water in the sedimentation tank rises to a certain level a portion of it flows through a pipe into a chamber containing a float-tank, consisting of an upper and lower holder, connected with a flap valve. When the upper half is full its weight is sufficient to slightly open the valve, through which the fluid passes into the lower half, the extra weight causing the valve to become fully opened, and the sewage rushes into the next chamber, which is provided with a number of outlets corresponding to the number of bacteria beds. These outlets are controlled by means of flap-valves, which are opened and shut automatically and in rotation by the revolution of a shaft carrying arms, which catch projections at the top of the valves, causing them to open, the arms being so arranged round the revolving shaft that when one valve is opened the one previously in action is closed. The revolving shaft is connected with a ratchet wheel,

actuated by the movement of the float-tank in filling and emptying, which by this operation turns the shaft sufficiently to release one arm and to bring another into contact with the next valve. The speed at which it works depends upon the sewage itself, for if the flow be heavy the float rises quickly; if slight, slowly, and of course at the same rate turns the shaft. After the sewage has passed the outlets it flows into Ridgway's automatic distributor, which consists of spreaders of open troughs with perforations along the bottom of one side of each, hung from an iron standard and so balanced that friction is reduced to a minimum; a small head causes it to revolve at a speed which is easily regulated. Messrs. Mather & Platt were awarded a silver medal for their water-softening apparatus, a bronze medal for their feed-water filter, and a bronze medal for their automatic distributing and flushing valves, and their gravity filter is selected for further consideration.

Messrs. Wilson & Stockall, Bury, inventors, patentees and manufacturers of all kinds of ambulances, have for their exhibit both a brougham and an accident ambulance. Taking the brougham ambulance first, we may here mention it was purchased on behalf of the city of Birmingham, where four of them are already in use. It is designed for removing infectious cases to isolation hospitals, and every care has been taken in designing and building to render it thoroughly suitable for that purpose. In appearance it resembles, when closed, an ordinary private brougham. For opening to receive or discharge a patient the whole of the back swings open on hinges, and to keep it securely fixed and wide-open is secured automatically by a catch. It is fitted with a portable stretcher running on a grooved frame, which is extended beyond the body of the carriage when the stretcher is being replaced or removed, and folds up inside the door at back when not required. There is ample room inside for the attendant, and a locker contains everything that would be required in an emergency for the patient, and the windows are filled with glass which, while allowing the patients to see clearly through them, prevents them being seen by passers-by. Should the patient not require to lie down, the frame and stretcher can be instantly removed, and it can be used as an ordinary four-seated brougham. The great feature of the accident ambulance is the easy provision for ingress and egress, being hung so low on a cranked mail patent axle of superior quality that a patient can be placed in position with the greatest possible ease, and owing to a particular mode of adaptation of the springs any jolting or

uncomfortable motion is reduced to a minimum. It contains two stretchers: (1) which is slung and runs in on a folding frame, with an ingenious arrangement for raising and lowering; (2) the bottom stretcher is furnished with rubber-tyred wheels, springs and axle (easily detachable), and can be used to run the patient along the floor, or can be carried up and down stairs. We gather from Messrs. Wilson & Stockall's excellently got-up catalogue, which will be found very useful for reference, that they have recently supplied ambulances to the following among other cities and towns besides Birmingham:—Belfast, Bradford (three), Brighton, Glasgow, Halifax, Hull, Manchester (five), Montevideo, Oldham (three), Scarborough, Sheffield (two), York.

A most interesting exhibit is that of *William E. Farrer*, 36 Cannon Street, Birmingham, Stand 75, where numerous new features are shown. We noticed particularly a new urinal made from a material called "Torfit," a specially prepared, highly disinfectant composition, by which urine coming in contact with it is rendered innocuous and deprived of noxious smells. With proper cleansing and an occasional coating of all exposed surfaces with a patent "Torfit" extract, it remains impervious and efficient for any length of time. The material is formed of slabs made in suitable sizes for the backs, ends, divisions, channel and floor treads. Besides being in itself economical in first cost, it effects a great saving of water for flushing purposes, which is a point greatly in its favour. The latest form of flushing syphon is also shown, and engineers and surveyors will find that many of the difficulties experienced, through leaky joints and consequent loss of compression are overcome. It embodies in one casting all the hitherto loose parts essential for effective working, its improved shape increases the velocity of the discharge, the chamber in which the syphon is placed is completely emptied owing to the improvement in the compression pipe, and the trap cannot be unsealed during or after discharge. The vent-pipe at the outlet relieves any back pressure and forms a means of charging up the trap after fixing. There are no flanges to bed, thus avoiding the danger of a leakage at this point, and it will work with drop-by-drop feed and with sewage or clean water.

A highly ingenious but very simple form of hand penstock, working smoothly and instantaneously by means of a lattice gear, has been awarded a bronze medal and has attracted considerable attention. So also has an adjustable bracket, which by means of a sliding top, which can be fixed at any joint by a set pin, enables one stock size to be used for any size of cistern

LONDON, E.C.

or shelf varying from 7½ inches to 15 inches in width. A bronze medal has also been awarded for this, a very neat improvement in lavatory basins. The Farrer patent "bead-rim" was shown and also secured a bronze medal. This bead-rim by its shape effectually prevents water splashing and consequent wet floors, no matter how high the incoming pressure or how great the oscillation. There is no danger of an accumulation of soap or dirt under the rim, but it is both clean and sanitary, and can be adapted to every form of washing apparatus.

Messrs. W. Harriman & Co., Ltd., of Newcastle-on-Tyne, have a large and varied exhibit of well-made sanitary goods comprising white glazed sinks and lavatories in various patterns, as well as urinal channels, to suit different requirements. An example of the Standard access system of drainage is also shown, consisting of access pipes, bends, junctions and traps, by the use of which expensive manholes are avoided, while the system can at any time be easily inspected and rodded if necessary without disturbing the ground. An interesting feature is also Harriman's branch channel blocks for manholes, for receiving branch drains through adjustable pipe bends, whereby concrete surfaces are dispensed with and a better appearance obtained. Noticeable, too, among other good things are access pipes, bends, junctions and traps for easily inspecting and rodding drains without breaking the pipes, and the Union adjustable stoneware street gully, which is designed to meet the requirements of the Local Government Board and possesses distinct advantages. At the spacious stand of Messrs. Harriman & Co., Ltd., may be noted, moreover, an intercepting chamber showing the application of Barron's patent channel-bends, besides samples of Barron's improved rain-water shoes, patent interceptor, anti-foul gully-traps and adjustable disconnecting traps with air-tight access covers for inspection and sweeping, all of which are well deserving of attention.

Messrs. Meldrum Brothers, Ltd., show a model of the top-feed "Simplex" destructor furnace in conjunction with a steam generator of the water-tube type. The furnace, it will be noticed, forms one continuous cell or chamber, the grate being in three divisions, each of which is charged or clinkered alternately with the other divisions, whereby part of the grate is always in a white and hot incandescent state, thus insuring the maintenance of a very high and uniform temperature in the furnace and combustion chamber, whereby all noxious fumes are thoroughly cremated, and any risk of

nuisance obviated. The capacity of this furnace is, we understand, from 40 to 50 tons of refuse per day of twenty-four hours, while the boiler evaporation is equal to from 450 to 600 gallons per hour net. There is also shown a destructor model of the front-feed type, the design and method of working being the same as the preceding, except that the refuse is fed into the furnace at the front instead of from the top of the cells. Messrs. Meldrum exhibit in addition the "Koker" stoker (Meldrum's and Clayton's patents), which is applicable to all types of boilers and furnaces, suitable for machine firing, besides bars of a special type, designed to minimise the cost of repairs.

Messrs. Ewart & Son, Ltd., of Euston Road, London make a good display of their well-known geysers (bronze medal award), to which gas and water supplies are connected, showing how rapidly hot water may be obtained. The latest and most interesting pattern is the "Califont," which is designed to supply a constant stream of hot water at the rate of 8 gallons per minute, under a pressure, equal to that of the cold-water supply, to any number of taps on the same or different levels. This firm also show a number of improved cast-iron porcelain and metallic enamelled baths, with nickel-plated bath-room fittings and bath seats, together with several radiators, including the "Euston," which gives an even, constant heat, and is in itself complete, requiring merely a small gas supply to be attached, and to be filled with water when first placed in position.

One of the best displays of the exhibition is that of Messrs. Shanks & Co., Ltd., of Barrhead, Glasgow, whose specimens of cast-iron porcelain-enamelled baths, for which the silver medal has been awarded, and fittings, are of a very high character. Their new patent bath fitting designed for Hollymoor Asylum, near Birmingham, is compact, reliable, non-concussive and easily manipulated. The arrangement too is a very safe one, as cold water must be turned on first from "shut;" afterwards comes the tepid and then the hot, the supply being controlled by a loose key, which remains in the possession of the attendant. The waste tap outside is quick and accessible, while there is nothing that can be interfered with by the inmate, nor any projection by which he can inflict self-injury. Specially deserving of notice also is Shanks's patent surgical lavatory, with improved pedal action for hot and cold water, brought together into one combination, thus mixing the water, while only one pedal is used. Another noticeable lavatory is actuated by a lever at

the side, which is moved by the elbow or knees. There are in addition other interesting forms of surgical lavatories and fittings, besides several of Shanks's well-known patent closets, such as the "Unus" combination w.-c., the "Levern" siphonic closet with regulating valve supply, and the "Modern" closet, with float-valve cistern.

*Messrs. George Howson & Sons, Ltd.*, of Hanley, show a surgeon's lavatory for operating theatres, with pedal apparatus to operate taps and waste, besides a post-mortem operating table on pedestal, with ball bearings and slop pan, waste pipes and channel. Besides other things we also noticed a range of three serviceable lavatories and urinals, in addition to several closets, including the Motolite wash-down, the Clifford patent syphonic, the Paxton and the Rivolite wash-down water-closet, all of which present a good appearance.

*The Hard York Patent Stone Company*, of Halifax, exhibit laid sections of their nonslip hard York stone flags, which form a capital footway paving that is being used by over 350 public bodies and corporations throughout the country. The colour and foothold are similar to natural hard York stone; it has a fair surface, square edges the full depth, even thickness, and regular sizes, whilst experience has shown that it never becomes slippery. It is made by pressure, not by hand, and being of so fine a texture it can be coped to any size or shape far more readily. Shortly, it combines the best qualities of the hard York stone with all the advantage of a manufactured stone ready for laying, and forms an admirable material for footway paving, steps, landings, &c. The "Nonslip" stone, which has been awarded the bronze medal, is moreover, admirably suitable for window and door heads, sills, jambs and mullions, square and moulded steps, landings, coping, water tabling, decorative panels or any purpose for which an artificial stone can be used.

*Messrs. Sessions & Sons, Ltd.*, of Cardiff, exhibit several enamelled slate and marble mantelpieces and fire grates on approved hygienic principles, newly designed, besides enamelled glass swing and other signs artistically executed, together with some very good specimens of marbled glass for panelling and dadoes. Interesting models are also shown of slate sinks and tanks, in addition to urinals, slabs and fittings.

*Mr. Vernon Parker*, of 20 Victoria Street, Westminster, makes a prominent display of Hamblet's blue-brick ware, including bricks of various kinds, such as ordinary building, stable, kerb, channels, plinths, bull-nose copings and other forms, together with specimens of Duffy's Acme wood flooring,

and of Jarrah red gum, as well as deal paving blocks. Other exhibits comprise the Howatson filter, Hassall's improved patent safety pipe joint, for which the silver medal has been awarded, and a demonstration of the Shone system of ventilation of drains and sewers, which is applicable to old and new town sewerage works or to the ventilation of the drains of mansions, hotels, hospitals, barracks, &c.

*Messrs. Oates & Green, Ltd.*, of Halifax, make a capital display of various sanitary appliances, including the "Isolt" latrine, which is specially designed for school and institution work where absolute isolation is necessary, and the patent lavatory spray for schools, designed to allow a continuous or intermittent flow of water. Examples, moreover, are shown of the salt glazed patent taper urinal and the enamelled patent "Wyvern" urinal, together with the "Kroyvert" waste water-closet, all of which have admirable features and apparently well answer their purpose, besides the salt-glazed manger which has been awarded the bronze medal.

*The Cannon Iron Foundries, Ltd.*, of Bilston, Staffs, who have been awarded the silver medal for enamelled cast-iron, show an assortment of baths and sanitary ware in "porceliron," including the "Britannia," embodying the latest improvements from a sanitary standpoint, and the "Edwardian" bath with supply valves in the foot end. There are also good specimens of lavatories, besides the "Achilles" water-closet, the Bedford urinal and an assortment of the usual patterns of plug bowls, &c., together with a drinking fountain and some very serviceable gas-cooking stoves.

*The British Sanitary Company*, of Bothwell Street, Glasgow, exhibit specimens of their self-acting earth closets (silver medal award) in white and yellow pine, as well as pitch pine and oak. These new and improved earth closets may with confidence be recommended to architects, builders, sanitary engineers and the public generally as the most perfect appliances of the kind yet produced. The advantages comprise (1) the simplicity, strength and perfection of the mechanism; (2) the effective distribution of the deodorising material; (3) the large capacity of the magazine containing the deodorising material, and (4) its very moderate price. A noticeable feature, it may be added, is the perforated shovel which acts as a spreader, whereby certain action and equal distribution are alike secured.

*Messrs. Outram & Co.*, Excelsior Potteries, Woodville, near Burton-on-Trent, Stand-81, are to be congratulated on the success of Hassall's patent water-closet, of which they are the manufacturers, it being awarded, after severe tests, a bronze

medal, and receiving considerable attention. On each occasion while being tested the complete contents of the pan, whether paper, dish-cloths, coloured water, shavings, &c., were entirely flushed out, in no case requiring a second flush, and this by the use of  $1\frac{1}{2}$  gallon of water only, which we were informed is guaranteed to be sufficient in all cases. The style, quality, designs and flush of the various sanitary articles exhibited by Messrs. Outram & Co., such as water-closet pans, lavatory basins, urinals, basins, sinks, &c., deserve high commendation, and an inspection of them will prove both profitable and interesting.

*The Ames-Crosta Sanitary Engineering Company, Ltd.*, Nottingham, Stand 93, have a good display of the sanitary specialties for which they are well known, and also some of the more recent introductions. One of the latter, and which obtained a bronze medal, is Ames's patent stoneware conduits for electric cables, that externally resembles an ordinary drain pipe, but internally is divided by partitions into any required number of cable-ways, and has at the invert a suitable space left as a waterway to drain away any water or moisture that may find a way into the conduit, a sufficient space being allowed between the partitions at the joints to permit any leakage to fall into the invert, thus insuring the cableways being kept dry. This company received also a bronze medal for Crosta's patent surface water gully, having a complete double trap, perfectly sealing sewer gases.

A main feature at the stand of *Messrs. J. Duckett & Son, Ltd.*, is the highly-glazed amber-coloured ware for which the firm is well known; closets and urinals of this ware are set up in full working order. Messrs. Duckett also show several good specimens of white-glazed ware, including urinals, lavatory basins and channel blocks for manhole chambers; the largest shown of the latter is 3 feet by 2 feet, and is in one complete piece of ware. We understand that the firm is now executing an order for a large number of these blocks of larger and smaller sizes than given above for an extensive scheme of drainage reconstruction for the Rochdale Union, at the Dearnley warehouse, the engineers for the work being Messrs. Radcliffe & Chadwick, of King Street, Manchester. A new and much improved form of isolated syphonic closets in ranges is shown, and the well-known "Clencher" wash-down closet. Urinals with a new form of ware duct and spray are also exhibited; this new addition prevents splashing on the floor of the urinal. A very excellent specimen of red brickwork is, moreover, shown, built in connection with the setting up of

several working exhibits; the bricks, of first-class quality and splendid colour, are the production of the Huncoat Plastic Brick and Terra-cotta Company, Ltd., Accrington. The skilful arrangement of the exhibits is well worthy of notice.

The merits of the "Eclipse" patent glazing, which in addition to being watertight and dustproof gives the maximum amount of light, are very effectively displayed by the well-known firm of *Messrs. Mellows & Company* (bronze medal award), who have glazed most successfully a large number of electric lighting stations and power houses, for which the system is specially suited, in numerous places throughout the kingdom, and who, besides having recently completed the reglazing of Carlisle Citadel station, the Central Transept, Crystal Palace, and a large number of stations, &c., on the Great Central Railway, are at present engaged, we understand, on various railway and other works to the extent of about a million feet superficial or more, thus proving the high appreciation in which the system is held throughout the length and breadth of the land.

The importance of ventilation is now pretty generally recognised, and some attention is due to the Offa ventilator, shown by the *Offa Ventilating Company*, which consists of a frame secured in the wall, with opening through the same, and admits clean air in any position; absolutely, it is said, without draught.

The *Crystalline Company, Ltd.*, exhibit crystalline tiles, a new product manufactured from porcelain opal, with a "key" back to enable it to adhere perfectly to cement, so as to be adapted for covering walls, ceilings, lavatories, &c., and to form a sanitary wall tiling for hospitals. Samples, too, are shown of Verre-sur-Verre, a decoration on crystalline tiles, produced by using layers or casings of glass super-imposed upon the tiles.

The connection between health and the laundry is apparent to all, and therefore attention may well be directed to the high-class, modern laundry machinery exhibited by *Messrs. W. Summerscales & Sons, Ltd.*, of Keighley, for which the silver medal has been awarded, including the patent "Practical" and the "Challenge Renown" washing machines, which are made entirely of metal, and fitted with all the latest improvements, besides the patent automatic reversing motion and locking gear. Then there is the "Majestic" ironing and finishing machine of the Decouden type, embracing new features and modern improvements, which give it a first place in the market. We noticed also the "Electric" suspended hydro-extractor, made to be driven by

an electric motor designed to run at constant speed whether the cage is full or empty, while the whole machine is suspended on three pillars, making itself balancing and requiring no foundation.

"Mezotil," the ideal sanitary wall and ceiling covering, which has received the bronze medal award, is shown to much advantage by the sole manufacturers, the *London Tablet Company*, whose works are at Sydenham, S.E. The material consists of enamelled and decorated large zinc sheets, which have met with much approval for inside decorative purposes, especially where light, cleanliness and durability are essential requirements. The joints between the sheets are scarcely perceptible, and they may be underlined where it is desirable or necessary to get an absolutely hermetical water and steam-proof ceiling or wall. The material offers one unbroken, level, china-like surface, without raised points, ridges, or crevices for dirt and dust to settle in, and it can be easily and reliably cleaned. It is absolutely flexible, so that it will bend into and around the sharpest angles without cracking the enamel, while the lightness is a further advantage, as among other things the thin material secures a safe adhesion to the covered surfaces, and with a mastic so powerful as "Mezotil" cement, renders almost impossible, at the back of the covering, the formation of cavities. It is further claimed that "Mezotil" is the only material with which an absolutely damp-proof, hermetical and sanitary ceiling can be procured. We may add that over 120,000 square feet of "Mezotil" have just been supplied to the new Waverley Station hotel at Edinburgh for walls and ceilings.

The *Sanitary Block and Tile Pavement Company, Ltd.*, of Victoria Street, S.W., make a display of their sanitary block paving, which, owing to its freedom from expansion and contraction, is considered specially suitable for tramways, and it has consequently been laid in a large area of the Cardiff Corporation Electric Tramway system, also at Great Yarmouth, Nottingham and elsewhere. These blocks are made from Trinidad Lake asphalt mixed with crushed trap rock or other suitable material, each block being subjected to a very high pressure. The company have their paving in use in various London streets, and have supplied nearly 40,000 yards to the British Westinghouse Company's new works at Trafford Park, Manchester. Samples are also shown of sanitary paving blocks made from destructor refuse, as well as samples of a new improved thoroughly sanitary silent block, for which distinct advantages are claimed.

*Messrs. James Stott & Co.*, of Oldham, Manchester, make an efficient display of the "Stott" patent instantaneous water-heater. The apparatus consists primarily of a mixing cylinder or chamber filled with gravel, and to this supplies of cold water and steam are connected. By means of the gravel in the cylinder the cold water is broken up into its constituent molecules before coming into contact with the steam, and when afterwards the water mixes with the steam, thorough combination takes place. The steam condenses, gives up its heat to the cold water, and from the cylinder a continuous stream of hot water flows forward direct to the bath or where it may be required. Its temperature can be regulated to any degree with the greatest precision. Each heater is complete with special water and steam valves for connecting to their respective supply pipes. There is also shown the "Stott" water-heater ("safety" pattern), which is specially adapted for baths at public institutions, more particularly workhouses, asylums, infirmaries, &c. Further exhibits comprise the well-known "Stott" gas-bill reducer for checking pressure and otherwise reducing gas consumption; roof and ware inlet ventilators; together with the "Stott" electric ventilating fan for removing smoke and foul air from rooms, as well as for ventilating hotels, theatres and other public institutions, &c.

Among the various exhibits of *Messrs. J. Defries & Sons, Ltd.*, are the Equifex disinfection appliances, including a scale model of the improved saturated steam disinfectant, which has been awarded a silver medal, for absolute disinfection (Metropolitan Asylums Board type), with automatic recording gauge controlling the duration and sufficiency of each operation. We noticed also the "Equifex" disinfectant cleanser, an appliance which enables water from a main water supply to be automatically mixed with an exact proportion of disinfectant, antiseptic or deodorant solution. The automatic working of the apparatus has been found, in the disinfection of public streets, markets, abattoirs, &c., to effect a saving, we understand, of 80 per cent. on the cost of labour, and the complete utilisation of the disinfectant effects a still further economy.

The *Septic Tank Syndicate, Ltd.*, of Exeter, make a demonstration of their system of purifying sewage by natural means, including full-size alternating gear for two filters, suitable for filters of 100 to 200 square yards, full-sized gear for small installations, combining sprinkling distribution with contact in bed, and samples of filtered effluents. Photographs are also shown of installations which are of simple construction and

entirely automatic in action, consisting of (1) septic tanks in which all organic solids are liquefied and the formation of sludge avoided, and (2) automatic aerating filters.

The disposal of house refuse is a problem which has occupied the attention of many cities and towns during the last few years, and therefore the models shown by the *Horsfall Destructor Company* of their patent refuse destructor, "back-fed" and "top-fed" types, cannot well be allowed to escape observation, having received the silver medal, while the model of the refuse "Horsfall" patent centrifugal dust-catcher is equally entitled to consideration, as well as the photos and plans of plants erected in various parts by the company.

We have only room just to briefly mention, in addition, the following exhibits, several of which are deserving of a longer notice:—

*The Exhibit and Trading Company*, Liverpool.—Model bath-room completely fitted, porcelain bath and lavatory, with nickel-plated fittings.

*Slack & Brownlow*, Corton, near Manchester.—The Brownlow germ filters.

*Sanitas Company, Ltd.*—Kingzett's patent drain tester, "Sanitas," and other disinfectants in various forms.

*Burn Bros.*—Patent drain and gully plugs, bag stoppers, and "Eclipse" smoke machines, &c.

*Wilson's & Mathieson's, Ltd.*, Leeds.—Gas fires, boilers, stoves, together with gas appliances for domestic and other purposes.

*Brookes, Ltd.*, Halifax.—Specimens of Norwegian non-slipping granite setts and Myddleton macadam, as supplied to Leeds, Halifax and most of the leading corporations throughout the country.

*Hope & Sons.*—Disinfectant blocks for sewers and water-carts, together with various disinfectants.

*United Newry Granite Company, Ltd.*, Manchester.—Samples of grey granite paving setts from various quarries of the company in Newry, as supplied to the principal large towns.

*Tyler & Co.*, Coventry.—Tyler's automatic draught regulator and smoke preventer for land and marine boilers and other furnaces.

*Matthews & Yates*—Ventilating gas-stoves for heating purposes, also electric and other blowers for ventilation and refuse collecting.

*J. Oakes & Co.*, Alfreton.—Glazed stoneware pipes and fittings.

*R. Ravenor*, Newbury.—Ravenor's patent drain-tester.

*Jeyes's Sanitary Compounds Company, Ltd.*—Samples of Jeyes's fluid disinfectant, sanitary powder and pine-oil blocks for use in urinals and water-carts.

*Worrall & Co.*, Liverpool.—Fireproof door for the prevention of the spread of fire from one compartment to another; Bostwick collapsible gate, also wrought-iron gates.

*The Fireproof Plate Wall Co., Ltd.*, Manchester.—Sound-proof and sanitary fireproof partitions (Bruckner's and other patents), also samples of "Euboeolith" patent sanitary jointless floor.

*Day's Automatic Waste-Water Closet and Sanitary Pipe Syndicate, Ltd.*—Samples of specialties, also channels, bends, gullies, &c.

*G. B. Wilson*, Brierley, Yorks.—Patent gully dredger for cleaning out gully and interceptor traps, drains, &c.

*Newton, Chambers & Co., Ltd.*, Thorncliffe, near Sheffield.—Samples of "Izal" disinfectant fluid, powder and other preparations.

*C. Wills & Sons*, Bournemouth.—Specimens of Wills's patent joint for connecting ware and metal pipes, as applied to ordinary pedestal closets, and of Wills's patent junction.

*John Jones*, Chelsea.—Various sanitary goods, including patent intercepting chamber for drains, patent manhole and inspection eye covers, "Adapta" and "Deep Seal" gullies, &c.

*Pendleton Sanitary Engineering Co.*, Pendleton, Manchester.—New frame or cage for movable ashbins, designed and patented by Dr. Quine, having as its object the keeping of these ashbins in a proper place and under proper conditions; also Dr. Quine's ashbin cage for building on or fastening against wall, as well as for attaching to garden paling.

We have already given a full description of *Dr. Quine's System of Domestic Scavenging* for dealing with ashes and household refuse, and the favourable opinion which we then expressed may after this lapse of time be quite confirmed.

*"Loco" Drainage Apparatus Company, Ltd.*—Self-cleansing overflows and outlets for lavatory basins and baths, and "Loco" washdown closets (Lynde's patents), &c.

*The Sanitary Appliances Syndicate*—Various specialties, such as "The Only" non-ball valve cylindrical store cistern, automatic flushing apparatus, model water-closets, &c.

*Kitchen Bath Fitment Company*, Sheffield.—Specimens of baths for small dwellings, including the combination sink-stone bath and boiler, having hot and cold water supply.

### BUILDING REGULATIONS IN TORONTO.

THE loss of the lives of several firemen at a recent fire in a warehouse in Toronto has served the useful purpose of focussing public attention upon the necessity for proper inspection of buildings, and the adoption of building regulations suited to modern requirements. Nothing short of a disaster of this kind, says the *Canadian Architect*, would apparently cause the City Council to move in the matter. The Ontario Association of Architects and the Toronto Architectural Eighteen Club have jointly addressed a communication to the Council as follows:—That the architects of the city, understanding that it is proposed to reorganise the City Commissioner's department, believe that it would be to the city's interest that a committee of architects should be consulted in reference to the appointment of a city architect and the revision of the building by-laws. While the architects are of the opinion that it is exceedingly important that the very best man obtainable should be appointed as head of the building department, they think that for the designing and erection of the more important city structures better and more artistic results may be obtained by employing architects of known ability. The architect or engineer in charge of the building department should be thoroughly competent to judge of the stability of the most complex structures, with ability to calculate strains and stresses, and with a thorough knowledge of all kinds of building materials and processes. The chief concern of the architects, however, is the thorough revision of the building by-laws.

The building by-laws committee of the Toronto Chapter of the Ontario Association of Architects spent a large amount of time some seven years ago preparing a set of by-laws which were then presented to the property committee, and which, after one or two meetings for their consideration, were quickly shelved.

About eighteen months since the Toronto Architectural Eighteen Club also entered into correspondence with the property committee regarding the revision of the building by-

laws, after having obtained information regarding building by-laws from some six or eight American cities, and with no more tangle results.

It has been for many years a fact patent to all interested in building operations that the building by-laws are entirely behind the times and out of date, while some of the most usual and modern methods of construction are not even hinted at.

Among the latter may be mentioned steel cage construction, fireproofing in various forms and cement mortar in substitution of lime mortar, giving stronger walls with less thickness.

Many abuses have crept in through the by-law permitting flimsy additions to buildings by means of so-called mansard roofs, which are practically wooden buildings, having a slope of but a few inches from the perpendicular, while they are just as inflammable as any other wooden building.

Some of our largest buildings in the first-class fire limit are thus topped-out, and the license to use such a hazardous method of building is a menace not only to adjoining property, but the city at large.

An ordinance should be framed regulating the frontage line of buildings, especially in residential districts. There is scarcely a residential street in the city which is not marred, and the value of property adversely affected by the non-observance of a common frontage line.

An ordinance should also be framed to protect the owners of residential property from the incursion of shops and business places. The value of whole sections has been seriously reduced, and the character of the neighbourhood changed or lowered by the facility with which a shop may be introduced into a first-class residential block, and without any corresponding advantage to the residents.

There are many other matters which should receive immediate and careful consideration, if our city is to be kept abreast of the times. To accomplish these objects, we would respectfully suggest that your Board accept the offer of a committee to assist in putting the by-laws in satisfactory shape.

The Toronto Board of Trade has appointed a committee of its members to look into the matter of the building by-laws with a view to assisting in bringing about their much needed revision.

It is to be hoped that before the recollection of the recent disaster shall have faded from public memory, public sentiment will compel the Council to deal in a definite way with this important subject.

# The Architect.

## THE WEEK.

WITH the exception of Messrs. AUSTIN & PALEY, the list of competitors who are to take part in the real competition for the Liverpool Cathedral does not correspond with any of those which were prepared by architects who assumed the office of judges. Disappointment will no doubt arise, especially among the would-be prophets. There might, perhaps, be a stronger body of combatants, but so many of those nominated have shown ability in minor actions, they may be glad to prove themselves doughty in so important a struggle. The reputation of Liverpool was to some extent at stake, but the only local architect who has gained the distinction of honourable mention is Mr. JAMES H. COOK. The executive committee retain the right of inviting an architect or architects to submit designs and plans in the final competition, and the majority of architects throughout Great Britain would, we are confident, be glad to learn that Mr. COOK, as the representative of Liverpool, was allowed an opportunity of another effort under definite conditions. Each of the architects who will take part in the final competition will receive 300 guineas. The honorarium of the advisory architects was 500 guineas each. The discussions which were raised, and which it is to be hoped will not be renewed, did not aid in increasing the subscription list, but the promises of contributions amount to 154,114*l.* 16*s.* 3*d.*, and of that sum 71,646*l.* 14*s.* 11*d.* has been received.

In the address which M. BESNARD, as president of the international jury of the Turin Exhibition, delivered at the banquet last week, he called attention to the efforts which were made in France and England for the elevation of the workmen. He ascribed the work in England to "a noble pleiad of artists" who devoted themselves mainly to the furnishing of dwellings. In France it was the National Society of Fine Arts, aided by some generous writers, that founded an independent section for art workmen in the salons. Their example was followed in other countries, and the workman had become, he said, not only an equal but a confrère of painters and sculptors. They wished that clever workmen should cease to be anonymous, as was desired by manufacturers. They endeavoured to persuade the latter to assume the rôle of MÆCENAS, and among other things to found medals to reward workmen who were exhibitors. The efforts to individualise the workmen were only partially successful, but M. BESNARD was hopeful that in time there would be a more general co-operation.

MR. G. D. LESLIE, R.A., is not satisfied with opposing the reconstruction of the Sonning bridges; he has obtained from his brother, Sir BRADFORD LESLIE, who has been engaged in bridge-building for forty years, some advice about timber bridges. It is as follows:—"As to bridges, of course, masonry or brick-arched bridges are the best and most economical, because they are practically imperishable. Timber comes next; timber bridges properly designed are as strong as steel. If timber is burnettised with bichloride of zinc under pressure it becomes non-inflammable. BRUNEL's timber viaducts on the Cornish Railway carried the traffic for forty years, and many of them are still in existence. Timber bridges are half the price of steel; if the saving be invested at compound interest the accumulated fund would pay for the renewal of the timber from time to time as required, and still show a large economy as compared with steel. I might almost add that timber is safer than steel; a steel pillar or strut is liable to collapse by a blow, especially when under strain, and let down an entire span; timber will give or yield and recover its form. Steel is liable to corrosion in ungetatable places, and the damage may go on until the bridge collapses; this was the case with the Hastings suspension bridge at Calcutta." It is not good policy to exaggerate the advantages of timber for bridges. BRUNEL employed timber because wrought-iron was not in use at the time. There are few timber bridges to be found on English railways unless where they span roads or streams in out-of-the-way places. In America also where timber viaducts of most ingenious varieties were set up they have

been superseded by steel bridges. Cast-iron columns may succumb to the impact of a great force, but the steel piers and columns which are now constructed are not in much danger. Timber bridges can be made to assume picturesque forms, and on that account they may have their use in positions like Sonning. But experts will not agree with Sir BRADFORD LESLIE that they are to be preferred on account of their strength and endurance.

THE Lord Chamberlain and the London County Council are justified in taking all reasonable precautions against fires in theatres. It cannot be concealed that the arrangements for coping with this danger in London are inadequate, for not only is there a possibility of apparatus failing but, as lately happened in Queen Victoria Street, the firemen with all their bravery may be momentarily deprived of that aptitude for adapting means to ends which is necessary when lives are at stake. It is more prudent to rely on the structural character of the theatres, and to enable them to be safe when emergencies arise there should be continual attention. But the precautions could be easily adopted without any ostentatious display of watchfulness on the part of officials. At the present time it is not agreeable to hear statements which are enough to make nervous people unable to give all their minds to what is done on the stage. Managers have cause to complain about the creation of doubts as to the safety of their property. They have also cause to be dissatisfied with the want of uniformity in the orders which are given and through which alterations made in one year may be condemned in the following season. An Association of London Theatre Managers has been formed, and at the first meeting it was announced that their interests are identical with those of the public, and they were willing to do everything to diminish the risk of fire. But they ask that they should be exempt from the vexatious and possibly unreasonable demands of an ever-changing body. They are ready to pay all the costs of a permanent Government department attached to the Lord Chamberlain's Office or to the Home Office, where by the aid of experts a continuity and uniformity of administration would be secured. With a Government office of that kind little possibility would exist of creating panics. The supervision would not be by fits and starts, and the alterations called for need not be magnified into demands for the entire or partial demolition of the building. Theatrical managers have vast responsibilities in order to provide for the safety of the public. There is no necessity, and, indeed, no right to have it suggested that they are indifferent to the preservation of their property, for with a well-constructed building the alterations or precautions which are ordered ought not to be excessive in any one year.

THREE men were killed last week by the collapse of a crane at the Soothill Quarry near Dewsbury. At the inquest which followed, Mr. PICKERING, the chief inspector of mines and quarries in the district, said the crane appeared to have been well adapted for its work. The cause of the accident was the collapse of the foundation on which the footstone was resting. The mortar contained sufficient lime, but either the lime was not freshly slacked or properly mixed, or the stone had been fixed before the mortar had set, for there was no adherence between stone and mortar. When mortar is in such a condition it is more of the nature of a lubricant than a binder. Mr. AKEROYD, the managing director, in his evidence said that the mortar used at the quarries was composed of South Elmsall lime and river sand. Instructions were always given to mix the mortar in the proportion of one of lime and three of sand. Mr. AKEROYD could not account for the difference in the samples of mortar produced. The Coroner said that there must have been some mistake or carelessness, but on the whole there was an absence of criminality. The jury returned a verdict that the men met their death accidentally from the collapse of a crane, in the fixing of which improper mortar had been used. The disaster is evidence of the danger which is often lurking unseen in mortar, but owing to the covering escapes attention. Tile floors have occasionally to be taken up owing to a similar defect. As the work is limited in extent, labourers endeavour to evade the trouble of preparing the mortar with the care which is demanded when operations are on a large scale as in a building.

PAINTERS' ARCHITECTURE: CLAUDE.

### VASARI AND EVOLUTION.

WHEN in the middle of the sixteenth century GIORGIO VASARI began his famous *Lives of the most eminent painters, sculptors and architects*, there was a tendency among men to look backwards rather than forwards. The Church, which was the dominant power, always referred to the decline in fervour among Christians. The standard of primitive confessors was supposed to be almost unattainable. Political reformers had what might be called an ideal before their imagination in the ancient condition of Italy. The numerous petty states and the continual broils between them were compared with Imperial Rome, in which not only unity and greatness, but happiness existed. All who considered contemporary events in Italy were disposed to exclaim with RIENZI, who lived in the fourteenth century, "Where are now the old Romans, their virtue, their justice and their power? Why was I not born in those glorious days?"

In the case of art there were some grounds for believing that the skill of men was not strengthened by revolving years. In Florence, where VASARI lived, masterpieces of ancient sculpture were to be seen. The first edition of the *Lives* was dedicated to COSMO DE MEDICIS, whose family had enriched the city with invaluable examples of antiquity. However he might esteem his contemporaries or the Florentine artists of a preceding generation, VASARI could not fail to realise that the excellence of antiquity had not been reached. On the other hand, patriotism and the natural instinct by which artists consider their own age as entitled to respect and their own works deserving of patronage must have convinced him that improvement was not at an end, and that under certain circumstances Italy, and especially Florence, would be able to produce masterpieces worthy of the appreciation of the judges of a later time.

We have therefore in VASARI the optimist and the pessimist. He was a man of simple faith, and he believed that art resembled human life, and as men were born and in course of time attained maturity, then declined into the lean, and slippered pantaloons and finally passed away, art also was decreed to ascend towards perfection from humble beginnings, to subside into decadence, and lastly to become degenerate. There was a prevalent opinion then, as in earlier and in later ages, that the world was approaching its end, and VASARI acknowledged his ambition was to exercise an influence through his own writings about great artists which would be sufficient to keep men from the lethargy which was usually the beginning of the end. He expressed the hope that artists and patrons would be alike benefited by his biographies. Frankly he owned that the labour he had spent on gathering materials for his work and writing it was unrewarded, and he therefore expected that the Duke of FLORENCE and his relative, JULIUS III., the Pope, would not only recompense the biographer, but also protect the poor but clever men who were pursuing different branches of art.

As we have said, VASARI was at once hopeful and desponding; or, in other words, he believed in the advance of the arts and in the liability of a return to barbarism. He seemed to have a vision of evolution when he suggested that the CREATOR set an example to painters and sculptors by continually adding to or diminishing the form of man, as if it were at one time a plastic and misshapen model. That was a doctrine which at the period must have surprised many students of philosophy. It should be remembered that in VASARI'S days the early history of ancient art was based on inferences from passages in the Bible, as well as on statements of historians who were supposed to see the marvellous in whatever belonged to a former age. Thus BELUS, the son of NIMROD, who lived 200 years after the Deluge, was stated to have caused the preparation of the first statue. In Florence, if one of the MEDICIS demanded a remarkable painting or piece of sculpture the artists would have been emulous to obey. They were, however, artists who had gone through a long course of preparation. But VASARI did not ask himself how the competence was acquired which enabled the command of BELUS to be carried out, and which could only arise from the practice of several generations of men. Manifestly he was rather confused in attempting to deal with the origin of art, as when he says that the idols stolen by RACHEL from her father were imitations of some of the statues which SEMIRAMIS had ordered. There was no archaeologist in the sixteenth century to suggest that RACHEL'S strange gods, which were buried under the oak at Shechem, were symbolic rather than representative, and had none of the qualities of a work of art. VASARI is, however, careful to point out that idolatry consisted in the worship of graven figures and not in their formation. He was too religious a man to admit that even the suspicion of a censure of one of the arts was to be traced in the Scriptures.

He accepted the theory that the art of the Greeks was derived from the Ethiopians through the Egyptians. He was confident that sculpture and painting had reached perfection in the time of HOMER, his evidence being the description of the Shield of ACHILLES. He gives the credit to PROMETHEUS of having been the originator of sculpture, and of course with a heavenly artist sublimity was inevitable. With such examples before them the human artists could not be expected to surpass works which were executed by hands without any mortal feebleness. Indeed, VASARI held that the great artists must have been specially endowed by Providence, for not only were they, he informs us, painters and sculptors, but also musicians, poets and philosophers. It is evident he was a believer in the legend of PYGMALION, and that marble statues could be endowed with life. It was no wonder, therefore, as he says, that slaves were prohibited from practising the arts, although an acquaintance with Roman literature would have made him doubtful of that statement, for it is to be feared that many an able Greek sculptor wore the collar of servitude.

In justice to VASARI it must be granted that he was not altogether satisfied with the origin of sculpture which he related. Was he not of Tuscany, and why should a native of that region go for the beginnings of art to Egypt, or Ethiopia, or Chaldea, when the illustrious LEON BATTISTA ALBERTI, the architect, had declared that art existed at a still earlier time in Tuscany, and there was the wonderful sepulchre of PORSENA with its contents to support his assertions? Only a few years before while VASARI was engaged in writing his book, the *Chimaera* was found in his native town, Arezzo, and it was also assumed to confirm the belief in the antiquity of Etruscan sculpture. But finally VASARI concluded that the first model was man and the first artist nature. He declared that he knew of mere children who, without other teaching than that of nature, were able to practise art, and there was no reason why in former ages a similar course might not have been followed.

According to VASARI, the arts, after being assembled in Rome, deteriorated under the later CÆSARS. In building especially there was a declension, and he believed that was owing to the difficulty of meeting with able architects. He had a misgiving, however, that the change could be exceeded on other occasions, for all the arts were doomed to extinction. He allowed that during invasions of the barbarians architecture received rather more respect than painting or sculpture, because it ministered to utility. Even more destructive than the Goths, according to VASARI, were zealous Christians, whose rage against everything dating from pagan times was unbounded. It is a gloomy chapter in the history of the world which he had to narrate, but it is not to be expected that the spirit of progress will always continue to operate on the same lines. VASARI would not have been sorry if the early churches which he described as Gothic, but which are now known generally as Romanesque, had in turn been overthrown like the pagan temples. He was an architect with admiration for Roman forms, and all other styles were of no value in his eyes. He was no doubt proud to be in a position to declare that it was in Florence the revival of architecture began with the church of St. Apostolo, which was so graceful in its forms and so admirably proportioned that BRUNELLESCHI employed it as a model for two of his churches. Signor CATTANEO does not agree with VASARI about the age of the church, nor that it was founded by CHARLEMAGNE. It is a more modern building, and is not supposed to date beyond the eleventh century. That period VASARI admits was favourable to architecture, for the church of San Miniato was rebuilt. But the art of mosaic-working was not then in an advanced state, and the example in the church referred to by VASARI was executed in 1297. The construction of the Pisan Cathedral from the design of BUSCHETTO, according to VASARI, excited emulation in other cities which was favourable to progress. Soon after churches were erected in Pistoja, Lucca and elsewhere which were evidence of a new spirit.

It is strange that VASARI was unable to realise the fallacy of his theory about the power of nature to become an instructor when he speaks of the examples of painting and sculpture which were undertaken in the eleventh and twelfth centuries. Here again he displays his Tuscan patriotism. Not until 1250 was Heaven moved to pity, he says, by the noble spirits which Tuscany reared to restore to them their primitive skill. Then their eyes were opened; they realised the beauty of the antique, and endeavoured to imitate it. They discovered the weakness of the Byzantine artists, who in Florence and elsewhere were allowed to produce hideous figures.

The reformation in painting he ascribes to CIMABUE, who was a Florentine, and it is apparent that partiality for a fellow-countryman was not without effect on several of the biographies. It is possible that CIMABUE was not so far above contemporary artists as is made out. VASARI is always contrasting his works with some of which no trace remains, and even when they are a little crude, as he confesses, they are in his eyes meritorious besides some others. Lord LEIGHTON helped to impart a new interest to CIMABUE. He classes him with DUCCIO, who in VASARI'S time was considered to be below mediocrity, and believes that the works of the two are impregnated with Byzantine feeling and occasionally reveal startling reminiscences of Classic dignity and power. Rigidly interpreted, that means

the adoption of stereotyped forms. VASARI seems to be nearer the truth when he affirms that GIOTTO alone, by Heaven's blessing, succeeded in resuscitating art and leading it into the right path.

It is remarkable in going through the pages of VASARI how often it appears to be necessary to make fresh starts in every one of the arts. Evidently it was not easy to discover what was accomplished by other men without undertaking toilsome journeys, and as the processes employed were often kept secret, the conclusions about them had frequently to be based on guesswork. The leaning tower of Pisa, for instance, is a popular example of the results of careless piling, yet piles must have been used in many parts of Italy, and the method of dealing with them was easily discovered. It seems incredible also that in a country where stone abounded nobody used stone paving before ARNOLFO DI LAPPO in the thirteenth century, or that the art of preparing the cement utilised in fixing mosaic should be unknown until ANDREA brought a Greek to Florence.

It was the precariousness of the existence of artists which must have inspired VASARI with the despondency which is so often noticeable in his biographies. Everything important in art depended on individuals, and in the sixteenth century there were so many dangers to life that the best artist might unexpectedly pass away. There was also much secretiveness about processes, and VASARI, from his peculiar status—for he was not only an artist but an encyclopædist in whatever related to art—well knew that in a sudden quarrel of a few moments duration the knowledge and skill which had been patiently acquired might vanish, and there would be a revival to some extent of the Dark Ages. He could not rise to the position of realising that the world was subjected to system and there was a special providence in the fall of a sparrow. He must have lived in a constant apprehension of danger to the arts he loved. And yet there is no work in the world which is more suggestive of the forces which were in operation during the long period of the Renaissance, and how they all tended towards an end which we can well call progress. It did not necessarily entail that a great artist was succeeded by one who was greater, or that the latest of VASARI'S biographies have surpassed those with which the series was opened. That might be the outcome of an evolution inspired by mortals. In the mundane system there is ebbing and flowing, but advance seems predestined. To us VASARI'S Lives appear to be full of hope, and many artists may consider living in the times he describes was preferable to living in the twentieth century. It is, however, difficult to judge fairly of progress when we have to look at it closely. Then we cannot help falling into the moods of hope and fear which alternated in VASARI'S mind. But as we are, or should be, better instructed about the course of events, courage and not despair should predominate with us.

#### ENGINEERING AND ARCHITECTURAL EDUCATION IN AMERICA.

THE success of the Americans not only in many varieties of manufacture, but in the fine arts, is to Europeans the more remarkable because it was unexpected. For years there was a popular belief in this country that the products of the people of the United States were intended to deceive the unwary, and it was thought the ingenuity for creating shams was not confined to wooden nutmegs. The prejudice was in some measure owing to the writers of English books of travels. They were not qualified to discern the extent of the inventive powers of the Americans, and they adopted the manner of superior beings who pitied the rude attempts of imitators. The railways which had to be constructed as cheaply as possible were compared with the English North-Western and Great Western. It was not realised how efficacious were the American tracks in uniting new settlements which were far apart, and how they served that end by the most economical adaptation of materials. The early bridges might appear to be frail structures, but they sustained the traffic until the companies became sufficiently prosperous to be able to erect bridges of another class. The preference then given to trusses, bracing and latticing rather than to solid webs like the Britannia and Victoria

bridges was enough to indicate the respect for economy, and the resolve to employ material in the positions where it was needed and nowhere else. It is now plain that in knowledge of the principles of braced construction the Americans were far ahead of English engineers. It was science not empiricism which guided them, and it might have been foreseen that a similar procedure would be observed in other classes of work.

It was true that in America the inventiveness was a native characteristic and could not be said to have been fostered or created by schools or colleges. It is only necessary to glance over the pages of EMERSON, who was college bred, to discover how little the best minds in America thought about that mode of instruction. Attendance in a university was fancied to be useful in dispelling the illusion that such institutions were of service in strengthening the individual. No true man it was asserted was produced by college rules. CHARLES DICKENS, who was disposed to be severe when judging American institutions, was not afraid to display more kindness to the universities. Whatever might be their defects, he said that they disseminated no prejudices, reared no bigots, dug up no old superstitions, and never interposed between the people and their improvement. At a later time EMERSON modified many of his conclusions, and acknowledged that universities and colleges had their uses as agents in progress. The system of teaching, however, which was adopted did not correspond with that of Europe. With the Americans the ideal man is a creator adapting the materials afforded by nature to new requirements. The endeavour is to qualify him for that purpose by strengthening the faculties with which he is endowed. In all parts of Europe the aim of a university might be shortly expressed by saying it is the production of a learned man who is to be a reservoir of the knowledge which has descended from the past, and who can use it for his own enjoyment or the benefit of others by talking or teaching. That condition of mind is to an American a luxury which few can attain. Our modern technical colleges are no more than imitations of the system which has been in operation in the United States during several years. But that fact was not generally known in England. Mr. CARNEGIE was therefore acting wisely when he suggested to the promoters of the Birmingham University that they should visit the colleges and universities in the United States, in which there is a departure from the Mediæval system of instruction. The report which was prepared by the visitors is a document which deserves more attention than it has received.

In some cases tuition is free, and in colleges where fees of from 30% to 40% per annum are paid there are some free scholars. But the American nature is opposed to eleemosynary assistance, and students prefer to engage in outside work during the vacations so as to earn money to pay their fees. To obtain entrance into one of these institutions a matriculation examination must be passed, which is not as literary but is more mathematical than that for the University of London. The students are assumed to have the resolution to go through a four years' course and to become graduates. A working session ranges from thirty-three to thirty-eight weeks, and in addition there are excursion classes and workshop classes. The work of the student is not confined to attendance in a classroom. He has to get up the subject matter of the lectures at home, and in many instances lectures can be considered as an exposition and experimental illustration of the text-book. At each lecture particular students are questioned before the class about the text-book or the lectures, and are expected to be capable of drawing any needful diagrams on the blackboard. Any student who is unable or unwilling to keep up with the rest is excluded from the graduation course.

One of the results of the apprehension of being set aside is that the students keep continuously at work. In the fourth year a long time is devoted to the preparation of a thesis which represents an investigation of some technical problem by a student. We are told that in some cases they exemplify original researches on such subjects as running tests of a locomotive, experiments on the laws of slide-valve friction and on the viscosity and friction of lubricants. The theses are bound and preserved in the libraries, and in course of time will have biographical interest. It some-

times happens that students who have graduated return for post-graduate work, and for that purpose may join a different institution.

The number of teachers is much greater than in England. Specialisation is recognised as far as possible. For instance, in Sibley College, for 471 students there are six professors, three assistant professors, twelve instructors and twelve assistants, making a total staff of thirty-three. In the Institute of Technology, Boston, there are twenty-three professors, thirty assistant professors, fifty instructors and thirty-three assistants, or a staff of 136 for the instruction of 1,171 students. In the manual training classes there is usually one instructor to about twelve students.

The visitors were struck with the ample area assigned to the buildings. Each college stands in its own grounds, and is well lighted. Halls, staircases, corridors, classrooms and laboratories are all on a large scale. It is added that the apparatus, instead of being huddled away in dark corners, is set out and classified as if for exhibition, while the machinery occupies a space worthy of its importance. Students have a general as well as special libraries for each department, and the books can be taken home. The University of Philadelphia has a club for the students, the subscription being two dollars a year. All classes show enthusiasm for the new universities, and encouragement is given by generous gifts.

Manual training is an important part in the education. From five to nine hours a week are devoted to joinery, wood pattern-making, moulding and foundrywork, forging, fitting, metal turning and machinework. Where there is a summer vacation class the students work continuously for about eight hours a day for four weeks. Lathes, pumps and steam-engines are made wholly, or in part, and the care of engines and boilers is taught. From fifteen to twenty-five students work in one shop. A joiners' shop has usually about twenty benches, each fitted with a complete set of wood-working tools. There are also twenty plain lathes. The machinery comprises a circular saw, a planer and a band saw. There is a foundry with the usual appliances, a smith's shop with twenty fires. In the machine shop there are from twenty to thirty engine lathes, some of them adapted to heavy work, besides milling machines, planers, radial drills and shapers. Everything is suggestive of practical work rather than of amateur exercises. The lectures given are on kinematics of machinery, descriptive engineering, theory of heat engines, theory of hydraulics and motors, strength of materials, machine design.

Students of mechanical engineering as a rule go through a short course in electrical engineering. Students of electrical engineering for the first and second years follow nearly the same course as mechanical engineers, but in the third and fourth years laboratory work receives most attention. There is a desire that the distinction between the two branches should be abolished. The laboratories are furnished with varieties of dynamos and motors. There is no uniformity in the training of civil engineers and mechanical engineers; although the courses for the first year, viz. mathematics, physics, chemistry and workshop practice, are in some colleges identical for both, in others the manual training is entirely omitted. In Cornell University the civil engineers form an entirely separate body. Field work is carried on throughout the year and bridge construction occupies a large part of the two last years, the student preparing designs and stress sheets in accordance with the practice of the leading bridge companies. For mining students there are laboratories equipped for the treatment of ores of gold, copper, silver, lead. In Columbia University the students sometimes spend weeks in a mining district where the processes of mining can be inspected. The chemical laboratories are spacious and electrolytic methods are being introduced. The professors are usually experts in chemical industries, and all sections of the science, including sanitary chemistry, are provided for. The visitors came to the conclusion that the system adopted in the colleges they inspected at Boston, Worcester, Cambridge, Ithica, Chicago, Baltimore, Philadelphia, New York, Jersey City, with no great modifications may be admirably adapted to British requirements. According to them the essential difference between the American and the British plans consists in the provision in

the former of large workshops and spacious laboratories well fitted with appliances for large classes, and in the four years' course, which alone makes the thorough manual training possible.

Every Government and all who sympathise with authority are obliged to realise the importance of imports and exports, and, if possible, to secure that the exports are in excess. In a country like America, where heavy duties are charged on the products of other countries, the revenue is largely assisted by that means. It is a public duty, therefore, to aid the export trade, and on that account machinery and other appliances should be constructed to suit foreign demands. Architecture, unfortunately, cannot be classed among exports, although American architects would willingly accept foreign commissions. The reason which makes the universities eager to train able engineers does not apply to architects. It has been arranged, however, that architectural studies are also to come under the protection of several universities. In some, as in Illinois, two courses of study are recognised, the artistic and the engineering or constructional. In Syracuse architects and engineers take mathematics, language and history together, while students of art and architecture follow similar courses in freehand drawing. It is recognised by the American architects that engineering as a whole receives more attention, and they desire that in the universities the students should be kept during the four years' course closely to architecture, thus leaving elementary knowledge to be acquired in preparatory schools. It would be necessary in order to attain that end for a rearrangement of courses of study to take place. There is so strong a desire that America should be distinguished in whatever is knowable or to be taught, it is not unlikely that changes will be made by which the architectural student will be placed on a similar footing with the French student. The disposition shown towards art confirms what was said by DICKENS about the universities never becoming an obstacle between the people and their improvement, and that a world is recognised as lying beyond the college walls. How long a time must elapse before the authorities of the English universities will assume so friendly an attitude towards architecture or any of the other fine arts?

### ISOLATION HOSPITALS.\*

IN determining the hospital accommodation which will be required for the treatment of infectious disease in any particular locality, the number, character, occupation and surroundings of the population will be the main factors for consideration, not only with a view to the regular and constant recurrence of infectious disease in populous and crowded neighbourhoods, but also to periods of epidemic when some particular form of infection has gained a footing, and when a sudden and increased demand will be made for beds. Upon the industrial character of the neighbourhood will mainly depend how far the future is to be taken into account. If works and workmen's houses are likely to increase in number, the enlargement or duplication of any hospital, whether general or infectious, may be confidently anticipated as the development takes place. In a purely residential neighbourhood the first provision need not be proportionately so large, nor the need for extension so carefully considered, because infectious disease is less frequent, does not spread so rapidly, and is more effectively dealt with in better and detached houses than it can be in more crowded districts. Neither is it a matter of existence in the same degree, because the bread-winners are not necessarily involved in complete severance from their work for a long period of infection, to which also they have better chance of resistance.

It is considered that in urban districts one bed per 1,000, and in rural districts one per 1,500 of the population is the ratio to be observed, and, as a rough guide, this may be a near enough approximation. But experience will probably modify this estimate in many districts, while the need for future extension must be still borne in mind, and also the possibility that an epidemic might tax resources of the medical authorities to their utmost capacity.

In speaking generally of isolation hospitals, those for the reception of the commoner diseases are usually implied, while those for smallpox stand by themselves, and though constructionally the same, must be more carefully separated from other

buildings, and, when possible, completely isolated and in the open, and must have a larger space per bed and more ample provision for ventilation. It seems unlikely that the number of diseases classed as infectious will diminish; but it is outside the scope of this paper to describe such buildings, for instance, as those for the isolation of consumption patients, or of such special diseases as plague, precautions against which must be vigilantly observed, though its treatment as an epidemic in this country must necessarily be one of emergency rather than one of regular establishment.

In England, while general hospitals are usually built and managed by private effort, it falls to some constituted local authority to erect, equip and maintain those specially designed for infectious cases. Our large infirmaries seem, on the whole, to succeed under private management upon voluntary subscriptions and endowment. But an infectious hospital may in many districts be comparatively little used. The continuous interest needed for private effort is wanting, the yearly expenditure is an uncertain quantity, and the nature of the place forbids communication with the outside world. Moreover, it is as much a protective as a remedial institution, and it is therefore natural to look to a local governing body, with its legal status and rate aid, to provide protection for the community it governs. The only question is whether organisation might not be better effected and protection more complete if larger areas and less divided responsibility were substituted for our present system.

Local authorities have, of late years, realised their responsibility in this matter, and a great improvement has taken place in the methods of dealing with infectious disease, but the provision in many rural districts—especially those where small industrial centres are scattered about—is often very inadequate. In times of epidemic the result is often careless removal and premature discharge, sometimes leading to serious results. Constant recurrence of disease in particular localities is due generally to preventable causes, and if such causes were carefully investigated and remedied much sickness and misery might be prevented and cost saved in the treatment of disease. The authorities should not have to provide hasty and improper accommodation or to discharge patients too soon in order to make room for others.

It may perhaps be here noted that the ability and standing of the medical officer of health is of the very greatest importance, not only in the management of the hospitals, but in reducing their number and costliness, and the economic loss caused by disease and death. It is, to my mind, very desirable that he should be an independent man, with no private practice, and in charge of a large enough district to keep him fully employed; indeed, it is a question whether each county could not have its complete organisation for dealing with infectious disease, able to secure the very best man as its chief medical officer, with district officers under him, and with large powers for dealing with hospital accommodation and with problems arising from insanitary dwellings and surroundings, and with sewage disposal, stream pollution and so on.

In the choice of a site the same principles apply as in the case of any building where people wish to live the healthiest possible lives, and in many towns it is really difficult to find such a site. If the ideal ground is not available the arrangement and construction of the buildings upon it must be such as to make the most of, and, if possible, improve the natural advantages already existing. In this country the conditions to be aimed at are a warm, dry soil, with good water-supply and outfall for drainage, a proper means of sewage disposal, as much open space round it and as much sun and air and quiet as possible. The best combination of accessibility and isolation are particular requirements. But, in any case, the site must be large enough to contain all the buildings required at proper specified distances one from another and from the boundaries, and to admit of future extension whenever it may be required or for temporary wards should they be needed in a sudden emergency of epidemic.

We may divide isolation hospitals into three classes:—

1. Large urban hospitals;
2. Hospitals of a smaller class serving a smaller town or country district;
3. Small isolation wards connected with a large institution, e.g. asylums, workhouses, &c.

The first and last of these will almost certainly be in the vicinity of other buildings, the second may and should stand perfectly free in the open country.

According to the Local Government Board requirements no buildings may be within 40 feet of each other or of the boundary, but more is of course desirable, if possible, especially if the value of land necessitates more than one storey. In a town the site should be surrounded on all sides by streets, and though a properly constructed and efficiently managed hospital is a security to a neighbourhood rather than a cause of infection, there may still be some degree of danger in a small hospital where the supervision and management happen to become lax.

In a crowded neighbourhood it is no doubt desirable for the

\* A paper read by Percy Scott Worthington, M.A., A.R.I.B.A., before the Sanitary Congress, Manchester.

local authority to obtain direct control over surrounding property, not only that it may exercise supervision when and where necessary, but also to secure possibility for extension, and where various authorities adjoin one another, none of which thinks itself justified in building their own hospital, they may combine in carrying out a joint scheme, while friendly co-operation between neighbouring councils may result in either dealing with infectious disease in one place or so distributing the buildings as best to serve the aggregate population.

However small or simple an isolation hospital may be, it contains in its principle of arrangement and of construction the germs of larger and more complicated buildings, and in materials and details, so far as they go, there should be no difference whatever. Let us, therefore, to begin with, take a simple form of hospital and examine the points to be observed in its plan and construction.

In districts where only a small number of beds is required it is not necessary to make any considerable provision for subdivision of diseases. Small isolation-rooms in connection with the larger men's and women's wards will probably be sufficient. But if more than, say, twenty beds (ten men and ten women) are needed, the consideration of subdivision will come in; distinct buildings will then be required for the treatment of diseases.

Let us take a hospital for fourteen beds—seven men and seven women.

The administration will be in the centre, dividing the men's and women's sides, and connected to each by an isolated corridor, and containing accommodation for matron and nurses, a doctor's room, reception-room (which will probably also serve for discharging patients), a bath-room, stores and offices, with kitchen and its offices at the back. Behind, in a detached building, will be the mortuary, ambulance house and disinfectory, with boiler-house, coal stores, &c.

For dealing with infected linen and clothes a galvanised iron tub on wheels will be found most useful, which should stand just outside an opening convenient for receiving the infected things and with an arrangement for turning boiling water and disinfectants into it. Everything can then be removed at once to the disinfectory.

The wards on each side are approached from the administration by a corridor, which should have a disconnecting lobby or covered way open to the air between the administration and the other buildings. From these either side of the hospital may be approached directly without passage through the administration buildings, and each side will contain a ward for six beds with a kitchen adjoining and dividing it from a single ward, or perhaps two, for isolating cases from the larger ward. The kitchen should have a small range for keeping food warm, boiling milk, &c., a sink with hot and cold water supply and a ventilated cupboard for keeping food and milk, and it must also have means of supervision of the larger and smaller ward through windows opening into each. There will be a store for ward linen, &c. Convalescent rooms are, perhaps, a luxury in a small hospital. As much opportunity as possible should be given for throwing corridors completely open to the air.

Separate sanitary arrangements cannot be provided, and are not needed for the small wards, but those for the larger wards should be in detached blocks and separated from them by cross ventilated lobbies with a door at each end, so as to form complete cut-off passages. The bathing and washing arrangements should be in a separate block from the w.c.'s and nurses' sinks, and both should be slightly warmed to a lower temperature than that of the wards by pipes in connection with the hot-water service. A similar means may be adopted for keeping linen stores properly aired. One w.c. to ten patients is sufficient, and adjoining should be the sink-room for slops, washing ward utensils, &c., and out of this should open a private nurses' w.c. The sanitary blocks should be lined with glazed bricks or tiles; if the former, narrow division bricks, known as Shepwood bricks, make strong and thin partition walls. The divisions need not go up to the ceiling, and thus cross ventilation may be obtained by windows on opposite sides. In the smallest hospitals fixed baths are not always required, a movable one being alone provided. But this is not a very desirable arrangement. The best baths for hospital use are probably vitreous enamel baths, which are now made by many firms, and which, while having a lasting surface similar to that of a stoneware bath, are much less costly, and being made of metal, get heated at once instead of remaining cold like stoneware.

As to the space to be given to each bed the following are the figures generally accepted:—Cubic space of air per bed, 2,000 cubic feet; floor space per bed, 144 square feet; wall space per bed, 12 feet lineal between centre. The figures give a ward 24 feet wide, a little under 14 feet high, and of a length according to the number of beds, each additional bed adding 12 feet to the room. In a single-bedded ward the height of 14 feet gives a room 12 feet square, or 14 × 10. These rooms

may with advantage be made rather larger, and a height of 12 feet 6 inches or 13 feet is quite enough.

In a hospital of this type the wards should be not at right-angles with the remainder of the building, so that one side wall against which the beds are placed is partly an interval wall, but so that the interval wall is the end of the ward, and so that a window may be placed between each of the beds.

Small isolation wards will be required in most large general infirmaries for a few beds for men and women, especially in districts where mining and other accidents of a similar nature are frequent. They afford the means of isolating infectious disease should it occur, pending its removal to an infectious hospital, but will be chiefly useful for the treatment of septic cases.

The moderate sized hospital for larger rural districts will consist (1) of an administration block which must either be built large enough in the first instance to suit further extension, or so planned that a definite idea of the necessary additions is laid down in the original plans, a proviso which applies also to the arrangement of the ward blocks and to the laying-out of the site generally. The administration block contains the accommodation in the hospital previously described upon a suitable scale, with a dispensary and rooms for a caretaker and his wife, who will look after the hospital if it is empty and be qualified to help in it when it is occupied, or a separate cottage may be erected.

In addition to the receiving-room, a detached discharging-room should be provided, with bathing facilities and clothes storage, &c. The administration block will be near the entrance, but so placed with regard to the wards as to render service as convenient as possible, for food will have to be prepared here and distributed to the wards, with which there may be connection by covered ways open at the sides.

In the country it should never be necessary to build the wards of more than one storey, but, as before mentioned, the site should be adapted to considerably more ward accommodation than is built at first. The men's and women's sides must be completely separate and pavilions erected for the treatment of separate diseases, so that no two may be located in the same room. A small single ward in a pavilion may be safely used in case of an isolated case even in the same block with other diseases if due precautions are taken, but it is not desirable.

In this climate it is only in very exceptional summers that we get too much of the sun, and the wards must therefore be planned so as to catch the most useful sunlight all the year round, and the axes of the wards should therefore be north-east and south-west. The planning of the wards will be upon the same principle as those previously described, the number of beds in each being determined by the needs of the locality and the convenience of nursing.

It is recommended sometimes that all the wards should be built upon arches so that there is a clear air space underneath open to the air as there is above and around. The idea is plausible, and from a constructional point of view permissible where a hospital ward is of necessity raised a man's height above the level of the ground and the space below cannot be usefully occupied. On very sloping ground, where the wards must be connected by corridors, this sometimes happens in order to avoid unduly steep gradients in the corridors, but never in an infectious hospital where the buildings are completely detached, and will be adapted with terraces each to its own position. Unless the arched space is high enough to walk about in, it only becomes a receptacle for all kinds of refuse and rubbish, and even then, unless properly attended to. The ward walls should be built straight up from the foundations, the area under them covered with 6 inches of concrete after the top soil has been removed, the space below the floor easily accessible and sufficiently high for inspection, and thoroughly well ventilated by air grids, through which no vermin can penetrate.

There still remain those large urban hospitals to which different conditions apply, and where the details of administration become considerably more complicated. Here we shall require more wards and further subdivision, and besides them the following buildings:—(1) A receiving block; (2) discharging block; (3) porter's lodge; (4) quarters for the resident medical staff; (5) quarters for matron, nurses and servants; (6) kitchens and stores so placed that they are central and convenient for the service of the whole establishment; (7) dispensary; (8) block containing boiler-house, disinfectory and destructor, mortuary and post-mortem rooms, ambulance sheds and stables, and conveniently situated with regard to the boilers, washhouses and laundries for the patients and the staff.

It is probable that the wards may have to be of more than one storey. Their axes should be N.E. and S.W., and no two wards, either on the same or different levels, should have communication by closed passage, stair or lift with one another. The pavilions may be connected by open covered ways, but every one must have its access direct from the open air.

In a large hospital which is continually occupied it is

necessary to allow the wards in turn to lie empty or fallow for a time, and therefore this must be taken into consideration in the number of wards required. The rooms attached to each ward, which should not contain more than twenty to twenty-four beds, will be more in number than in the previous types examined. In addition to a ward kitchen there will be a room for the sister in charge, and probably two separation wards, one adjoining and inspected from the ward kitchen, the other from the sister's room. The supply of these rooms should be liberal, as they may be used not only for cases which require separation from the general ward, but also for private paying patients, whose number will probably increase rather than diminish in the future, though they should not be allowed to encroach upon the primary object of such a hospital, *i.e.* the isolation and nursing of the sick poor. Still the objection does not apply in the case of an infectious hospital to the same extent as in a general infirmary since their isolation is a protection to the public. The sanitary blocks will be of the same character as those before described, but in proportion to the number of beds, and containing a small room for the retention and examination of excreta, with a sink in a ventilated cupboard.

Circular wards are not unsuitable for infectious purposes. They are very little more expensive than rectangular wards; ventilation and warming is very easily managed, they are easy for nursing and pleasant for patients, and they fit many positions on a site into which it would be difficult to put a rectangular building to hold the same number of beds. They are not extravagant up to about sixteen beds; beyond that number the diameter has to be so largely increased for every additional bed that the cubic contents swell very rapidly, and hence the cost becomes proportionately much greater than that of a rectangular ward.

A few words should be said about materials and details of construction, and about warming and ventilation, which make or mar the convenience, durability and usefulness of a hospital, independently of its general arrangement.

The materials used should of course be as absorbent as possible, and their surfaces hard, smooth and easily cleaned, with no holes or corners for lodgement of dirt, dust or germs. Probably nothing is better for walls and ceilings than Portland cement or adamant or for the floors than terrazzo; all floors should be of solid concrete. Terrazzo is apt to crack if laid in the ordinary manner, but this may be largely prevented, and it is probably better for the purpose under consideration than any wood-block floor. There is, however, a wide difference of opinion about this, but if a wooden surface is adopted, the blocks (oak or maple, for choice) should be thoroughly well seasoned, and great care should be taken as to the atmospheric conditions under which they are laid.

All external and internal angles to walls, floors and ceilings should, of course, be rounded, and raised borders should run along the lateral walls of the wards to keep the beds off the walls, and in one-storey wards and on the first floor of two-storeyed blocks the ceiling may with advantage be curved if the proper ventilation is secured at the highest point.

The windows should, up to about two-thirds of their height, have double-hung sashes, the lower half with a deep bottom rail to allow of the admission of air at the meeting rails without draught at the bottom, or so as to fall inwards as a hopper, the sides of which are closed in by projecting casings filling up the angles flush with the wall face on their inner side. Above the sashes is a transom dividing them from three hoppers, one above the other, which open and close with gearing worked by a key in possession of the nurses. The doors should be upon the same principle, the place of the sashes being taken by the doors, and the ventilating hoppers in both should be carried as near the ceiling as possible. The doors of all rooms should be glazed in the upper part for light and easy inspection.

Wooden floors should be wax-polished and other woodwork varnished and cement walls painted and varnished. Fireplaces in the smaller rooms are probably best made of salt glazed or faience ware, very simple and without mouldings, and the ward fireplaces should be considered as a part of the scheme for their warming and ventilation.

This problem of ventilation is, as everyone knows, the most difficult with which an architect has to deal owing to the uncertainty of atmospheric conditions.

The ventilation of one-storey wards in an open position is, of course, simpler than that of wards of more than one storey in a town atmosphere, and probably doors, windows and effective types of roof ventilators, and of central stoves, will serve the purpose best. Ventilation must, of course, always be carefully considered in connection with any artificial heating introduced apart from the stoves.

If a certainty is to be made of effective ventilation without draught in all sorts of weather, there is no doubt that mechanical means must be adopted, and that warmed air must be admitted and the vitiated air extracted by fans through flues in the walls.

The atmosphere of manufacturing towns is not what we

should wish to admit to a hospital, and attempts are often made to cleanse and warm or cool the incoming air in basement chambers, and thence pass it through ducts into the rooms. In hospitals, this seems to me a bad thing. Its costliness is no objection if it is the best method and if the money is available, but it entails grave defects, to my mind, as applied upon a large scale.

The air admitted to the wards is not of the pleasantest or healthiest nature, and the excessive length of ducts for inlet and outlet, inaccessible and sure to collect dust and germs after considerable use, become sources of danger.

It is quite possible to arrange the extraction of foul air at the ceiling level, and at one point, so that the shaft is of comparatively short length, straight and large enough for a man to get into for cleaning purposes. But it is impossible to heat a large ward satisfactorily upon this principle with only one inlet, and it is the multiplication of the flues that is, to my mind, undesirable.

On the other hand, the system is quite applicable on a small scale, *e.g.* for the warming and ventilating of an operating-room, provided that the greatest care is taken to secure the means of cleaning and disinfection.

One simple way of warming is by admitting the air through grids at various points, and passing it over radiators or pipes with proper shields to prevent too rapid admission and consequent draught, and auxiliary warmth may be obtained by the use of central faience or iron stoves with down-cast smoke flues and inlets for fresh air from the side walls, through which the air is admitted to the centre of the stove, passed round it and emitted warmed through gratings in the top or sides. But proper methods of cleaning must be provided from the outside of the building for both smoke and air flues, and no cleaning doors in the floor should be allowed.

In country districts water and sewage will be difficulties. The former will, of course, be one of the first considerations in the choice of a site, and without it no hospital can be erected. If it is to be found on the site the disposal of sewage becomes a still more important consideration. The subject is so large that it cannot well be entered upon at this stage, but failing a proper sewer the best recognised and tried method of treatment is by septic tanks. Here, however, there is still the difficulty of the overflow, which must be turned into a stream somewhere or other, and though after the tanks once get into working order the effluent is apparently as good as can be expected, it is not certain that it always remains so after exposure to atmospheric and other influences. It may be distributed over the land, and an interesting experiment is, I understand, being tried in this neighbourhood in utilising it by pumping into the boilers.

I assume familiarity with the Local Government Board requirements, which are quite good and have altered very little since their first publication.

A paper of this length leaves no room for the treatment of the subject of isolation hospitals in anything but a cursory manner, and as my point of view is that of the architect, there will, no doubt, be many points of management and so on that have been disregarded. I am quite aware also that there will be differences of opinion even from the architect's side of the question, to which, I hope, expression may be given, for in all these things it is the balance of the best experience and opinion which determine future development.

#### SCHOOL OF ART WOOD-CARVING.

THE School of Art Wood-carving, South Kensington, which now occupies rooms on the top floor of the new building of the Royal School of Art Needlework in Exhibition Road, has been reopened after the usual summer vacation, and we are requested to state that some of the free studentships maintained by means of funds granted to the school by the Technical Education Board of the London County Council and by the Drapers' Company are vacant. The day classes of the school are held from 10 to 1 and 2 to 5 on five days of the week, and from 10 to 1 on Saturdays. The evening class meets on three evenings a week and on Saturday afternoons. Forms of application for the free studentships and any further particulars relating to the school may be obtained from the manager.

**The Students' Days** at the National Gallery of British Art, Millbank (the Tate Gallery), will be, from October 7, Tuesdays and Wednesdays, instead of Thursdays and Fridays, as at present. The public will be admitted on Tuesdays and Wednesdays, students' days, upon payment of 6d.; on the remaining days of the week the gallery is open to the public free.

## NOTES AND COMMENTS.

DURING several years Arundel Castle has been undergoing restoration and renewal, and a large amount of money was expended on the works. In the town, which is remarkable for indifference to rebuilding, the extent of the works has made the populace believe that all the profits derived from the transformation of Norfolk Street and the rest of the Duke of NORFOLK'S property near the Strand has to be expended on Arundel Castle. Landscape-painters may not believe the new walls to be as worthy of representation as those which bore the marks of time. But there is no doubt that the castle, if regarded as a group of buildings, has benefited by the alterations. Every architect knows that generally the expenditure of money makes a building more valuable in the ordinary sense of the word, although it may lose some of its historical interest by the substitution of new masonry for old. If we could imagine Arundel Castle in the property market, it would now command a higher price than was likely to have been given before the structural alterations were undertaken. The local poor law overseers have adopted that theory, and they have increased the value of the property from 1,200*l.* to 2,000*l.* a year. It is needless to say that if judged by size, quality, position, &c., both sums are insignificant. But the stately homes of England are never valued on the same basis as common residences. There is always apprehension that the owners might refuse to occupy their castles if the taxation were too high, and then loss would be suffered by the people in the vicinity. An appeal was raised against the valuation, and the amount was reduced to 1,750*l.*, but that sum has not been agreed to by the Duke's advisers. Unless there is a compromise, the case will, therefore, have to be brought before Quarter Sessions. So many considerations have to be taken into account, it is difficult to see what is to be the issue. But if instead of a castle the building was a factory, it would be taken for granted that 1,750*l.* was a remarkably low valuation, and the rates would be cheerfully paid which were assessed.

HERALDS are not imaginative or rather inventive in devising mottoes. Some of the new metropolitan sub-cities have, in consequence, been forced to seek for mottoes for arms by means of competition. The people of Glasgow may well be envied for the aptness of theirs. What can be more significant than "Let Glasgow flourish"? Not only every loyal citizen, but people in many parts of the world have joined in that wish. How did it originate? That is a subject which has been under the attention of the Town Council, for on June 30 a committee was appointed to consider the propriety of so altering the motto of the city as to restore it to something like its former phraseology. The history of a motto may be as good a subject for investigation as could be easily found, but restoration or completion is another matter. The proverb runs, "Let well enough alone," and it should be applied in this case. It has been ascertained, however, that originally the emblems or devices on the Corporation's seals were derived from those displayed by the bishops. But apparently there was no motto during a long period. On a bell for the Tron Church which was ordered in 1631 there is an inscription in the circle surrounding the shield which runs, "LORD, let Glasgow flourish through the preaching of Thy Word and praising Thy Name." That is the first authenticated instance of an inscription or motto accompanying the arms of Glasgow. But whether it was only one of the pious wishes used by bell-founders or was dictated by heralds cannot be ascertained. Subsequently the inscription was abbreviated to "Let Glasgow flourish by the preaching of the Word," and finally to "Let Glasgow flourish." The last was in use in 1699. Readers of romances are also aware that it was a common expression in the early part of the eighteenth century. Did not ROB ROY utter the words as an exclamation when he heard of the feat of Bailie NICOL JARVIE with the red-hot poker at the Clachen of Aberfoyle? The longer inscription could not be employed so familiarly. We may compare the motto to the Venus of Milo. That noble statue is likewise incomplete. But judging by the failure of the experiments to restore it to its former state, it is better to accept it in its present form, and a like conclusion may be applied to the Glasgow inscription.

LLOYD'S BUILDING, FENCHURCH STREET, E.C.: THE VESTIBULE.

KING'S COLLEGE SCHOOL, WIMBLEDON COMMON, S.W.

KING'S College School was opened in 1831, having been founded as part of the Royal foundation of King's College, London, by royal charter of King GEORGE IV., bearing date August 14, 1829. The school was from the first and still is under the government of the Council of King's College. The first head-master, the Rev. J. R. MAJOR, D.D., held office for thirty-six years; his successor, Dr. MACLEAR, for twelve years. In 1880 Dr. STOKOE became head-master, and in 1889 he was succeeded by the present head-master, the Rev. C. W. BOURNE, M.A., of St. John's College, Cambridge. Until 1897 the school was carried on at King's College in the Strand. In that year the Council, in view of the superior advantages of a country over a town site and of the officially recognised need for a school of the first rank in this neighbourhood, decided to remove the school to its present situation facing Wimbledon Common. The site possessed the advantage of large buildings already in existence and easily adaptable for school purposes. But it was recognised from the first that it would be necessary to supplement the existing building at an early date. As a first instalment of the complete design for the permanent buildings, the Council have erected the large hall and classrooms opened by Field-Marshal H.R.H. the Duke of CAMBRIDGE, K.G., on July 6, 1899.

The new school buildings consist on the ground floor of six new classrooms, each 24 feet by 17 feet and 12 feet in height. These open off a corridor 7 feet wide and are connected by a still wider corridor with the old school buildings.

On the upper floor is the great hall, which measures 84 feet by 42 feet 6 inches and which has a height of 20 feet to the tie beam. This is one of the largest school halls in England. It is covered with an ornamented open timber roof of queen post type. The walls of the hall are of red brick, which gives it a bright and warm appearance, the roof being stained a dark colour. There will eventually be a gallery across the entrance end of the hall, as shown in the interior view.

The exterior of the building is faced with red bricks. The traceried and mullioned windows are executed in Corsham Down stone.

Special attention has been paid to the heating and ventilation of the building so as to bring it up to modern requirements. Fresh warmed air is introduced over ventilating radiators and is drawn from each classroom through an air trunk in the corridor floor into a heated main upcast flue. A continuous stream of warm fresh air is thus continually passing through the classrooms, which have an equable temperature throughout. The great hall is also thoroughly heated and ventilated.

The style the architects have selected is of the collegiate type, but with sufficient modern feeling to differentiate it from previous examples and give it a character of its own. The large windows at the ends of the great hall are of ample proportions. In the flanking towers to the front are the staircases to the great hall, and the upper parts are used as record-rooms for the school archives.

The new block forms the central feature of the complete design, and conveys an idea of the handsome appearance which the school will present when finished. The cost up to the present has been over 7,000*l.*

The general contractors for the whole building are Messrs. GOUGH & Co., of Hendon. The stonework and carving is by Messrs. FLINT, of New Street, Kennington. The clerk of works has been Mr. THOMAS GAMAGE. The work has been carried out from the designs and under the superintendence of Messrs. BANISTER FLETCHER & SONS, architects.

ST. DAVID'S CHURCH, BATHGATE.

CONGREGATIONAL CHURCH, FINCHLEY ROAD.

## DENE HOLES AT BEXLEY.\*

ACCORDING to Hasted's History of Kent, Baldwyns is a seat and reputed manor situated at the south-west corner of Dartford Heath. This place was anciently in the possession of Sir John Baude, a man of an honourable family in this kingdom, of whom it acquired the name of Baudwins, which it keeps at present, the difference of the language of the times only excepted.

It afterwards came into the possession of the abbot and convent of Lewes, who were possessed of lands in this parish as early as King John's reign; they in the first year of King Henry VIII. held it with other lands adjoining of the manor of Temple Dartford by the yearly rent of 2s. 5d. and suit of court.

In the sixteenth year of Henry VIII., on the suppression of this abbey, the revenues of it were granted to Cardinal Wolsey for the better endowment of his college, vulgarly called "Cardinal's College," at Oxford. Four years afterwards this, among other estates, was forfeited to the king, and became part of the royal revenues. That king, in his twenty-third year, granted it by the name of the manor of Baudwyns to Eton College, "to which it now belongs. (1797.)"

The Adams were formerly lessees of this estate under the college; afterwards held by Lovelace; and then by Sir Edward Hulse, Bart. He was the eldest son of Edward Hulse, M.D., by Dorothy, daughter of Thomas Westrow, Esq., and married Elizabeth, daughter of Richard Lovell, Lord Mayor in 1790. By her he had three sons, Edward, who succeeded him in title; Westrow, who died before him; and Richard, of whom

BEXLEY CHURCH.

further mention will be made, and a daughter Elizabeth, married to John Calvert, Esq. Several years before his death he retired to Baldwyns, where he died 1759, and was buried in Wilmington churchyard. At his death he bequeathed his interest in the estate to his second son, Richard Hulse, who resided there. He served the office of sheriff in 1768, but on his removing to Blackheath in 1783 he sold his interest in it to Arnold Nesbit, Esq., who resided there, and in 1791 alienated it to Simon Frazer, Esq., a director of the East India Company. Mr. Frazer's daughter married Alexander, Lord Sefton, who died there in 1793.

Henry VII. granted 140 acres of Joyden Wood to Henry Cooke in capite by knight's service. The ancient camp and hut circles which you inspected to-day is supposed to be the site of Caswallon's city. Caswallon was a British chief, to whom the honour has been ascribed of defeating Cæsar.

William Lambarde, in his Perambulations, written about 1570, says:—"There are to be seen as well in the open heath (Bexley) neare to this towne (Crayford) as also in the closed grounds about it, sundry artificial caves or holes in the earth, whereof some have ten, fifteen and some twenty fathoms in depth; at the mouth (and hence downward) narrow, like to the tounell of a chimney or passage of a well; but in the bottom large, and of great receipt, insomuch as some of them have sundry roomes (or partitions) one within another, strongly vaulted and supported with pillars of chalke, and in the opinion of the inhabitants these were in former times digged, as well for the use of the chalke towards building, as for to marle (or amend) their arable lands therewith. But I suppose that they were made to another's ende also by the Saxons our ancestors, who (after the manner of their elders) used them as

receptacles and places of secret retraits for their wives, children and portable goods, in the times both of civil dissention and foreine invasion."

Pliny says, "The Britons used to sink pits 100 feet in depth, narrow at the mouth, but within of great compass." Tacitus mentions them only as store-houses for corn and refuge from the enemy. Diodorus, Greek historian, writing of the tribes inhabiting Britain, says they gather in the harvest by cutting off the ears of corn and storing them in subterraneous repositories. Dene holes (A.S. denu=a cave, Eng. hole) consist of a vertical shaft 2 feet 6 inches to 3 feet in diameter, varying from a few feet to over one hundred feet in depth (one at Eltham is 140 feet deep), terminating in a cavern in the chalk. This is sometimes a single apartment, or, as in the deeper pits, may consist of a series of chambers symmetrically disposed round the shaft. Though generally close together the pits do not communicate. They abound in Kent north of the North Downs, and in Essex between Purfleet and East Tilbury. A few of the older and simpler pits have been explored and found to date back to the Stone Age. The deeper ones still need examination.

DENE HOLE, STANKEY WOOD.

On the Ordnance maps the word is spelled Daneholes, suggesting some connection with the Danes, and it has been seriously thought by some that these holes were made as places of refuge during Danish raids. The dene holes were undoubtedly in existence hundreds of years before the Danes made their appearance in this country, and these caverns may have been used for the purpose of concealment during the attacks of these rovers of the sea, but this could not have been their primary use.

SECTION OF DENE HOLE IN STANKEY WOOD.

Thomas Pennant, in his Journey from Chester to London, 1811, says that the holes were merely chalk-pits, and that chalk was being obtained in precisely the same manner in his time. Camden, writing in his "Magna Britannia," is of the

\* A paper read by Mr. T. P. Wiggins before the members of the Upper Norwood Athenæum, with additional notes by Mr. W. F. Harradence and Mr. W. F. Potter.

same opinion and agrees with Pliny. Mr. J. G. Waller, F.S.A., in endorsing these opinions, says, "Opinions are a pleasant exercise of the imagination, and once entertained are hard to be given up, and of all things a simple solution of a difficulty is about the greatest offence that can be given to those entertaining them." In answer to all this Mr. T. V. Holmes F.G.S., M.A.I., writes:—"Dene holes are concentrated where there are 40 to 60 feet of other materials above the chalk, though there is in each case plenty of bare chalk within a mile; the chalk-pit hypothesis involves us in the manifest absurdity that the makers of these ancient caverns deliberately preferred to concentrate their excavations where they obtained the least return for their labour. Now it is scarcely needful to remark that no people, ancient or modern, savage or civilised, ever did anything of the kind."

Were they habitations? Mr. Miller Christy, who explored the dene holes in Hangman's Wood, near Grays Thurrock, Essex, is of opinion any race living in them would probably have been quickly exterminated by ague and rheumatism. Places of refuge: it seems to me they are hardly suitable for

INTERIOR OF DENE HOLE, STANKEY WOOD.

CAVE DWELLINGS, BALACLAVA.

this purpose unless there was some communication between adjacent pits.

On the whole it seems that the balance of evidence points to the conclusion that they were used for the storage of grain, and the absence of communication between them supports this theory, for in the event of the grain deteriorating the disease could not spread to adjoining pits. H. M. Stanley, the explorer, found similar caves used for this purpose by the natives during his journey through Central Africa, and at the present day the British Government has stored in similar receptacles seven years' supply of grain for the use of the garrison at Malta.

Mr. T. V. Holmes, writing in 1884 on the dene hole we visited, remarks:—

"Its shaft was in good preservation, the footholes at the side being very distinct. Below it presented at first sight an extremely confused appearance, the consequence of downfalls of chalk and Thanet sand from the roof, the regular dome-like shape of the spaces above, resulting from the downfalls, suggesting the thought that they must be the work of design, not of accident. But a glance at the plan of the pit given by

Mr. Spurrell, shows that we have in this example a dene hole that has not only reached the six-pillared stage, but one that is in a state of decadence owing to the removal of two of these pillars. He remarks that this removal seems to have been caused by a desire to obtain a large unobstructed space, and adds:—"The whole cave is embayed, yet rounded and symmetrical, all combining to give the idea of an excavation seeking space rather than the material excavated. The nearest cave to it on the west is within 10 feet, yet no effort in this case was made to unite them, though I have, when in one cave, heard persons knocking in the other."

He states that the greatest diameters are 49 feet and 38 feet, and the height about 25 feet. It is about 70 feet deep.

The cave is in Stankey Wood (Stanka or Stankye has the signification of digged holes). Scott, in a note on Cadyon Castle, quotes an old diary, in which he translates Stanka as ditch.

We had not decided upon the particular dene hole to be visited until Saturday morning. I originally intended to take you to one in Joyden Wood, but on inspection it was found to be in an unsuitable state. Captain Harston spent a great deal of time trying to find a larger and more perfect dene hole than the one visited by us.

The holes are very difficult to locate at this time of year, the bearings being obstructed in every direction.

An American writer once divided society into two classes, one class consisting of those who read aloud, and the other, those who were unfortunate enough to have to listen. He added the listeners generally thirsted for the blood of the reader, and as I want to get home alive to-night, I have made my paper as short as possible. With this I close my remarks, feeling sure there are many here who are more conversant with the subject than I am, and are anxious to give us the benefit of their knowledge.

To Mr. C. Harston, who very kindly gave us every facility for inspecting one of the dene holes on his estate; to Captain A. Harston, who has rendered me yeoman service above the earth and in it; to Lieutenant W. Geddes, who spent a bright afternoon underground to insure our safe transit; to Mr. J. R. Speck, who kindly took the flash-light photographs of the cave; to Mrs. Harston and her daughters, who pleasantly regaled us with an *al fresco* tea; and to other kindly helpers I tender my most grateful thanks, thanks which I know will be echoed by every member of the Society.

The illustrations are from drawings and photographs by Mr. J. R. Speck and Mr. Charles Wheeler.

(To be concluded.)

## DURHAM AND NORTHUMBERLAND ARCHÆOLOGICAL SOCIETY.

THE members of this Society held their fourth country meeting of the year at Melsonby, Stanwick and Coniscliffe, and, as usual on these occasions, there was a large attendance of members. Darlington station was the rendezvous, and driving through Darlington and its pretty suburbs and away along the country roads into Yorkshire, the first stop was made at Middleton Tyas, where there is a charmingly-situated church with a Norman arcade, and other features of interest. Continuing the drive, the picturesque ivy-clad church at Melsonby was next visited, and the party was hospitably entertained by the rector (the Rev. Henry Ellison). Amongst the attractions of the church are two beautiful coped pre-Conquest grave covers, which received admiring attention. The rector, having before him a paper on the subject written by Dr. Greenwell, said that the fact that a church was in existence at Melsonby before the Norman Conquest was shown by the remaining grave-covers and other sculptural stones of the period. However, there was nothing left of the pre-Conquest church, nor was there anything to show that there had ever been a Norman one. It was probable that the pre-Conquest church remained until the new edifice was built. This might be regarded as the work of the latter part of the twelfth century—about 1180, or a few years later. The earliest part appeared to be the south arcade of the nave, which included among the capitals of the pillars two having the Transitional volute upon them. The tower is a massive and somewhat keep-like structure, and very probably served for the purpose of temporary defence. Part of a piece of glass in the vestry may belong, so Dr. Greenwell averred, to a family of Marshalls, as a coat of arms not very unlike was used by people of that name, who were once owners of Selaby, in the parish of Gainford. From Melsonby the journey was resumed to Stanwick, the great earthworks which form one of the most remarkable examples of prehistoric fortified enclosure in the kingdom being found on the way. Unfortunately rain fell heavily at this period of the day, so that a closer view of the works was not to be obtained without discomfort, which the party did not seem ready to undergo.

Stanwick Church contains several pre-Conquest sepulchral memorials. The building is of the thirteenth century. The Rev. Henry Pollexfen (the vicar) kindly explained the interesting portions, and then a move was made for Forcett, where other pre-Conquest crosses were examined. Then, after crossing the Tees at Pierce Bridge, another halt was made at Coniscliffe. Situated on the top of a rugged precipice overlooking the river, Coniscliffe Church presents a remarkably pretty picture, and from its ramparts a lovely view of the surrounding country was obtained. The church, with the exception of the nave, clerestory and roofs, is of the Early English period, having a western tower, nave (with north aisle) and chancel, the latter being of equal height with the nave and separated from it by a beautiful equilateral pointed arch, rising to the very roof. The vicar (the Rev. J. J. Brown) and Mrs. Brown kindly provided refreshments, and then the homeward journey to Darlington was accomplished, the party dining at the North-Eastern hotel before separating for their various destinations.

### LIVERPOOL CATHEDRAL.

THE following report has been received by the executive committee of the Liverpool Cathedral committee from Mr. R. Norman Shaw, R.A., and Mr. G. F. Bodley, R.A., advisory architects, on the designs submitted in the preliminary competition:—

Gentlemen,—Of the great importance of insuring a fine design for the proposed cathedral there can be no question. Truro alone in England has had a new cathedral, the first built for many generations. Truro is but a county town, while Liverpool is one of the largest and most important of our cities.

The new cathedral must be a stately, a dignified and a beautiful building. It must be suitable for the services of the English Church and be capable of holding large congregations. All this is obvious.

The committee having determined on a competition, it is our duty to select the best designs submitted in this preliminary competition, and then to invite their authors to compete for the great work in accordance with the regulations that may be laid down for their guidance.

What seems to be necessary is a design having a distinctive character of its own, and one not without originality—a design with a striking unity of effect and idea.

We were prepared to find more designs of a Renaissance or a Classical manner. We were surprised to find so few in those styles, and those, we feel bound to say, not commanding or remarkable. The main body of the best designs sent in are Gothic. This seemed to point to Gothic as the style from which we should find it practical to select. And, indeed, that manner is accepted by most as generally the suitable one, except under especial circumstances, for church building. In making a selection there seemed no doubt but that our own English phase of the style should be adhered to.

Many of the designs sent in have plans more or less like numerous fine Mediæval cathedrals, with many chapels clustering round the eastern end of the choir. It is no doubt an arrangement of much beauty. One or two such chapels may be desirable as being very useful in bringing comparatively small congregations together for early or evening services, but many such chapels would not seem to be appropriate for the uses of the English Church. There should certainly be one or two such chapels, but we suppose not more would be needed. Modifications of many of the plans submitted would, therefore, seem to be necessary. How far what we have said on this point should be embodied in the instructions to be given for the final competition we leave to the consideration of the committee.

We feel that the object of the competition is to enable the committee to find out the best man for the work. What he submits may be thoroughly examined and discussed, and, if it seems desirable, may be modified or improved on.

The opportunity, the great opportunity, must not be lost for the erection of a really stately and a beautiful building, one of striking proportions and of delightful detail. Our old ecclesiastical buildings afford many such examples. Not, indeed, that they should be copied, for Liverpool Cathedral must be an original work of art and have a character of its own—one fitted for the requirements of the present age and one specially designed for its site. The spirit of our best architecture may, however, well be caught, and its magnificent traditions may be recovered and handed on.

Whatever style is adopted, there should be that nobility of expression and that refinement of feeling that is so characteristic of all the best architecture of the great times. We may add that a noble simplicity, enhanced by touches of beauty, is not a thing to be afraid of.

In judging the designs one must take care to discern the real effect that the building would have, and not be led away

by any clever delineation of a conception that may not be really good. This is evident, but a first impression given by a clever and beautiful drawing, even though it be of a poor design, may be misleading and deceptive.

We shall look forward with interest and pleasure to the work of reporting to the committee on the designs to be sent in for the selection of one that may be not unworthy of your important and great city of Liverpool.

There has happily been some revival of taste and knowledge of architecture in recent years, and this new cathedral should show a dawning sign of that improving state of feeling, and mark the period as one of greater advance towards the beauty and the dignity that characterised the great days of art; and, above all, it should be an example of cultured and religious feeling in church building.

With regard to the plans submitted we beg to report that we have examined the various portfolios of designs, and all the drawings that were hung on the walls, with great care and with the deepest interest. The number in all is 103; of these thirty-three are designs prepared expressly for this competition. They represent much labour, and we may also say a considerable amount of talent. Twenty-three are sent as evidence of skill and ability to design a cathedral, and consist mainly of designs which have been submitted mostly in competition for large churches in different parts of the world.

The remainder are a miscellaneous collection of photographs, drawings and sketches, partly ecclesiastical and partly secular. Though many of them are of much excellence, they do not show any evidence that their authors have any special claim to be considered aspirants for the work of building a cathedral. It is vain to shut one's eyes to the fact that many of the competitors in this last class have taken absolutely no trouble. They have simply sent in a portfolio containing few or many photographs or drawings which they happened to have by them, whereas in the cases to which we first referred, where special designs have been prepared, the competitors have, many of them, taken great care and trouble, and have done their best to respond to the invitation of the committee.

From the plans sent in we have selected five that we consider show their designers to be capable men. They give evidence of considerable knowledge of old work, great care in design and originality of a sound and practical nature. Not the originality which has little aim beyond being eccentric for the sake of being considered original, but which does not regard beauty and fitness as necessary.

These five we suggest should be asked to prepare complete designs for the cathedral, in accordance with the conditions to be laid down by the committee.

This seems a small number to name out of such a long list of competitors, but, on the other hand, it may lead to greater effort being made to conceive and delineate a fine design, and with greater hope on the part of the designer of success, and, for the world, for an ultimate and satisfactory result. These designs are numbered Nos. 20, 45A, 68, 71, 95.

In addition to the above we consider it would be a gracious act, and one that would be appreciated, to nominate a certain number for honourable mention, as a distinct recognition of considerable skill shown sometimes in planning, and sometimes in design, though we were unable to award them a still more honourable place. We selected eight, namely, Nos. 17, 37, 41, 44, 45, 46, 84 and 94 for such honourable mention.

We are, Gentlemen, faithfully yours,

G. F. BODLEY, R.A.

R. NORMAN SHAW, R.A.

London: August 1902.

The five architects referred to in the report are:—

20. Messrs. Austin & Paley, Lancaster.

45A. C. A. Nicholson, 2 New Square, Lincoln's Inn, London, W.C.

68. G. Gilbert Scott, 40 York Mansions, Battersea Park, London.

71. Malcolm Stark, 11 Little College Street, Westminster, London, S.W.

95. W. J. Tapper, 1 Raymond Buildings, Gray's Inn, London, W.C.

Those honourably mentioned are:—

17. Sir Thomas Drew, 22 Clare Street, Dublin.

37. J. Oldrid Scott, 2 Dean's Yard, London, S.W.

41. A. H. Skipworth, 5 Staple Inn, London.

44. H. C. Corlett, 2 New Square, Lincoln's Inn, London, W.C.

45. C. A. Nicholson, 2 New Square, Lincoln's Inn, London, W.C.

46. F. Walley, 1 City Walls, Grey Friars, Chester.

84. James H. Cook, 12 St. George's Crescent, Liverpool.

94. Messrs. Reilly & Peach, Victoria Mansions, 28 Victoria Street, London, S.W.

A sum of 154,114*l.* has now been promised towards the cathedral.

## THE LATE J. F. BENTLEY.

CLIENTS are not always generous in testifying to the efforts of architects to serve them, and it may therefore be well to put on record the eulogium which Cardinal Vaughan penned on the designer of his cathedral. His Eminence said:—

The Society of Architects and many experts in various branches of art have already recognised, with generous and well-merited praise, his architectural genius. The cathedral will be his monument. For myself, I have a gratification in the thought that I gave him a free hand. Having laid down certain conditions as to size, space, chapels and style, I left the rest to him. He offered me the choice between a vaulted roof and one of saucer domes: I chose the latter. He wished to build two campaniles: I said one would be enough for me. For the rest he had a free hand. A metropolitan cathedral is not as a mission or a parish church—and the economics and limitations which I think ought, in a missionary country with small resources, to prevail, as a rule, in our ordinary buildings, would defeat a great religious object were they enforced upon the architect of a cathedral.

Mr. Bentley went to Italy to study the Roman and Byzantine styles. Rome, Palermo, Ravenna, Milan, Venice and Sancta Sophia furnished him with object lessons. What he saw and took in he steadily digested, and then, after a mental process that went on quietly and silently for months, he poured out rapidly on paper his matured conception of a Byzantine cathedral, and presented his plans, complete in all their wondrous lines and details, exactly as they have been carried out.

Mr. Bentley was a poet; he saw and felt the beauty, the fancy, the harmony and meaning of his artistic creations. He had no love of money, he cared little for economy; he had an immense love of art, a passion for truth and sincerity in his work. He was not ambitious to get on, he was not self-assertive, but he coveted to do well. He went in search of no work, but waited for the work to come in search of him. He was exquisitely gentle and considerate in dealing with suggestions and objections, but he would have his own way whenever it was a question of fidelity to his standard of artistic execution. I would not have singled him out to build cheap churches and schools, but he was the best of architects for a cathedral or for any work that was to excel in artistic beauty. He was no mere copyist and no slave to tradition. Whatever he produced was stamped with his own individuality, it was alive and original, and he had a genius for taking infinite pains with detail.

His reverence for God, for our Lord, His Blessed Mother and the saints pervaded everything he did for the Church. In his judgments on art and style there was a critical but a kindly humour; one always felt that there were an elevation and inspiration in his mind and character that were due to his religious instincts and to his unworldly standard of life. It seems to me that it will be necessary for the perfection of the work Mr. Bentley has left behind him, to retain his mind as a guide to its completion, as far as we can know it. We know what happened to St. Peter's and to other buildings in which the plan and the genius of the original architect were departed from. Let us maintain the main idea and the unity of Bentley's work to the end.

I am very glad to have known the man and to have been associated with him in the great work of his life. I am grateful that he lived to see the cathedral covered in and that he has left much on paper that we shall need. I shall always pray for him in case he need our prayers; and I recommend his soul to the prayers of all.

## TESSERÆ.

## Opie's Last Days.

WHEN Opie had finished his course of Academy lectures, Mr. Prince Hoare requested an article for his periodical paper called the *Artist*. "I am tired," such was his answer, "I am tired of writing. I shall be a gentleman during the spring months, keep a horse and ride out every morning." This vision of happiness, such as it was, he lived not to realise. He was attacked by a slow and a consuming illness which baffled the knowledge of five skilful doctors; Pitcairn and Baillie were of the number. They were unable to cure or even to comprehend it. When it was known that he was seriously ill, his friends, and they were numerous and respectable, came round him with affectionate solicitude. Amongst those that he loved most was Henry Thompson, and to him he confided the finishing of the robes of the Duke of Gloucester's portrait. On Saturday, when the pictures were to be delivered for the exhibition at Somerset House, the picture of the royal duke was placed at the foot of his bed. A fit of delirium had subsided; he lifted his head and said, "There is not colour enough on the back ground." More colour was added; Opie looked at it with great satisfaction and said with a smile, "Thompson, it

will do now—it will do now; if you could not do it nobody could." The delirium returned and took its hue from the picture he had just looked at. He imagined himself employed in his favourite pursuit, and continued painting in idea till death interposed on Thursday, April 9, 1807. On dissection the lower part of the spinal marrow and its investing membrane were found slightly inflamed, and the brain surcharged with blood. On Monday, April 20, he was interred in St. Paul's Cathedral, near Sir Joshua Reynolds. In person Opie looked like an inspired peasant; even in his most courtly days there was a country air about him, and he was abrupt in his language and careless in his dress, without being conscious of either. His looks savoured of melancholy—some have said of moroseness; the portrait which he has left of himself shows a noble forehead and an intellectual eye. There are few who cannot feel his talents, and all must admire his fortitude. He came coarse and uneducated from the country into the polished circles of London, was caressed, invited, praised and patronised for one little year or so, and then the giddy tide of fashion receded; but he was not left a wreck. He had that strength of mind which triumphs over despair. He estimated the patronage of fickle ignorance at what it was worth, and lived to invest his name with a brighter as well as steadier halo than that of fashionable wonder.

## The Veiled Face of Agamemnon.

In 1778 "The Sacrifice of Iphigenia" was assigned as the subject of the competition in painting for the students of painting in the Royal Academy. Reynolds observed that "every candidate has copied the celebrated invention of Timanthes in hiding the face of Agamemnon in his mantle, and that the adoption can neither be wondered at nor blamed." Timanthes felt like a father. He did not hide the face of Agamemnon because it was beyond the power of his art, nor because it was beyond the possibility, but because it was beyond the dignity of expression, because the inspiring feature of paternal affection at that moment, and the action which of necessity must have accompanied it, would either have destroyed the grandeur of the character and the solemnity of the scene or subjected the painter, with the majority of his judges, to the imputation of insensibility. He must either have represented him in tears or convulsed at the flash of the raised dagger, forgetting the chief in the father, or shown him absorbed by despair and in that state of stupefaction which levels all features and deadens expression. He might, indeed, have chosen a fourth mode: he might have exhibited him fainting and palsied in the arms of his attendants, and by this confusion of male and female character merited the applause of every theatre in Paris. But Timanthes had too true a sense of nature to expose a father's feelings or to tear a passion to rags, nor had the Greeks yet learnt of Rome to steel the face. If he made Agamemnon bear his calamity as a man, he made him also feel it as a man. It became the leader of Greece to sanction the ceremony with his presence; it did not become the father to see his daughter beneath the dagger's point. The arrangement is certainly one that "has served more than once." We find it adopted to express the grief of a beautiful female figure on a basso-relievo formerly in the Palace Valle at Rome, and preserved in the Admiranda of S. Bartoli; it is used, though with his own originality, by Michel Angelo in the figure of Abijam to mark unutterable woe; Raphael, to show that he thought it the best possible mode of expressing remorse and the deepest sense of repentance, borrowed it in the expulsion from Paradise, without any alteration, from Masaccio, and like him, turned Adam out with both his hands before his face. And how has he represented Moses at the burning bush, to express the astonished awe of human in the visible presence of divine nature? by a double repetition of the same expedient; once in the ceiling of a Stanza, and again in the Loggia of the Vatican, with both his hands before his face, or rather with his face immersed in his hands. As we cannot suspect in the master of expression the unworthy motive of making use of this mode merely to avoid a difficulty, or to denote the insupportable splendour of the vision, which was so far from being the case that, according to the sacred record, Moses stepped out of his way to examine the ineffectual blaze, we must conclude that nature herself dictated to him this method as superior to all he could express by features; and that he recognised the same dictate in Masaccio, who can no more be supposed to have been acquainted with the precedent of Timanthes than Shakespeare with that of Euripides, when he made Macduff draw his hat over his face. Masaccio and Raphael proceeded on the principle, Gherard Lairesse copied only the image of Timanthes, and has perhaps incurred by it the charge of what Longinus calls *parenthyrsos*, in the ill-timed application of supreme pathos to an inadequate call. Agamemnon is introduced covering his face with his mantle at the death of Polyxena, the captive daughter of Priam, sacrificed to the manes of Achilles.

## SANATORIA FOR CONSUMPTIVES.\*

*(Concluded from last week.)*

THE next building to describe is one of quite another type of plan. The Städtisches Sanatorium at Harlaching is a few miles drive from Munich, on the top of a hill, in a fir forest. This building may be described as a hospital. It is primarily for consumptives, but a few other cases of non-infectious character are received. They also make a specialty of dental surgery, and the dental operating-room is fitted with every kind of the most modern dental appliances. Accommodation is provided for 212 patients, half of each sex, but the ultimate scheme is to add buildings so as to accommodate 600 patients. There is the medical superintendent and three assistant medical officers. The remaining staff consists of a manager, a legal clerk, a clerk and one matron. There are twenty-one female nurses (members of a sisterhood), two male attendants. Of servants there are nine female and eight male, including engineering staff. The hospital is a building E-shaped on plan, three storeys in height, with, I am glad to say, no basement rooms. Its main entrance frontage is towards the north. There are twenty-eight wards, six with twenty beds, six with twelve beds, twelve with single beds, and eight isolation rooms, each with one bed, but I think some of these last named are appropriated for three-bed wards. The cubic capacity per patient is 36·36 metres.

There are four staircases, two near the centre and one at each end, and one lift. The windows reach nearly to the ceiling. There are twelve slipper baths and three douches, two slipper and one douche at each extreme angle, all contained in one room divided by partitions. There are eighteen w.c.'s for patients badly arranged, each group of three with a slop sink being placed in one room in the body of the building, with only one window. It is surprising to find such an arrangement in these modern buildings, an arrangement which the medical superintendents all condemn and lament.

The aspect of the wards is as follows:—The twenty-bed wards are axially east and west, with windows north and south. On the south side of the wards, three storeys high, are the Liegehallen, about 12 feet wide. Dr. Hermann thinks these very conveniently placed, but too wide, and owing to the fact that they are of solid masonry, arcuated on each floor, they keep off too much sun. Had they been 9 feet wide, with pillar construction, they would, he thinks, have been admirable. There are other Liegehallen in the grounds.

The twelve-bed wards are north and south, with windows east and west. The single-bed wards face east or west respectively, the isolation rooms north.

The floors of the wards are of concrete covered with linoleum. Walls and ceilings are plastered. No angles are rounded, a fact of which the doctor complains.

Ventilation when windows are closed is by means of warmed air inlet and by outlet shafts. Time is too short to allow me to describe these in detail. The fresh air is warmed by passing through a case containing a steam radiator, but Dr. Hermann, the medical superintendent, complains that the air so heated is too dry. To me this statement was interesting, because I have always had this objection to steam radiators for heating such inlets. The same result does not arise when hot water is used. The lighting is by electricity and all the clocks are electric.

The day accommodation for patients is excellent. There are two adjacent dining-rooms in the centre for the two sexes, looking into the large quadrangles, and a reading-room to the south of the dining-rooms. There are two handsome chapels, one for Roman Catholics, one for Protestants. The administrative block is north of the sanatorium. It is said to be sufficient for the ultimate scheme. The plan is very complete and admirable. There are, however, two points I venture to criticise, and these are:—(1) Placing the linen-drying rooms over the wash-house and finishing room. (2) Placing the disinfectant in the basement of the main block.

The plan of the whole is a hollow square surrounding an open quadrangle. The south block contains the doctors' and priest's residences. On the south-west is the laundry; on the south-east are the kitchens, with dining-rooms attached for female staff, and the residences of the assistant matrons and nursing sisters. The west side contains the residence of the manager, servants and engineer, and to the north of these the cow and pig stables, poultry-house, &c., with fodder lofts above. The east side contains the stables, coach-houses, &c.

The boiler-house and engineer's department are in the centre of the quad. The main basement contains heating apparatus, disinfectant and very extensive cellarage. The cow stable is a regular feature at most of the sanatoria, and those I have seen are beautifully kept. The importance of pure milk is evidently fully recognised.

We turn to yet another type of plan in the Volksheilstatte

Krailling, about half an hour's walk from Planegg, in Bavaria. The whole district is a forest, principally of pines, and the Volksheilstatte is beautifully placed, and seems the ideal abode of rest and seclusion. This is strictly a sanatorium for open-air treatment of men only. It receives 120 patients. There is a chief medical officer with two assistants. The matron does the correspondence, otherwise the institution is managed from Munich. There are twelve nursing sisters and three male attendants. There are twenty-one servants in all, male and female. The sanatorium contains a basement and three other storeys. It consists of a central block with two wings at widely obtuse angles, and at the south-east and south-west intersections there are pretty chapels for Roman Catholics and Protestants respectively. There are patients' rooms containing 109 beds; thirteen rooms have single beds, fourteen have two beds, six have three beds, two have four beds, six have five and two have six; but 120 patients can be accommodated if necessary. The cubic space in single bedrooms is 50 metres, in other rooms from 30 to 33 metres per patient. There are two staircases. The doors have fanlights, but not to the ceiling. All patients' rooms face south, and of the multi-bedded rooms there are four with side windows. There is an unobstructed corridor on the north side of the rooms in the wings. The kitchen is in the basement of the central block, the dining-room being on the ground floor on the south side, with a sitting-room adjacent. There are four slipper-baths in one room on the ground floor, divided by curtains, and one douche room. There are eighteen water-closets in groups of three arranged on each floor in one room in the heart of the building, with only one window. There is on each of the upper floors a room fitted with lavatory basins on both sides. In all there are thirty basins, the best accommodation I have seen in any sanatorium. The floors of all rooms are covered with linoleum. The walls and ceilings are of plaster with concave angles, except at floors, the omission of which is of course complained of. The patients' bedrooms are all on the first and second floors. The northern side of the ground floor of the west wing contains the matron's and nurses' rooms; that of the east wing the consulting-room, laboratory, doctors' bath-room and the patients' baths. On the south of these are corridors, and south of these again are the Liegehallen, about 3 metres wide. These form a structural arcaded verandah beneath the patients' bedrooms. There is also a Liegehalle 78 metres long in the woods, fitted with eighty couches. The medical officers' rooms are on the north side of the central block, with a committee-room on the first floor. At some distance east of the sanatorium is an administrative block connected by a subway. This block consists of basement and three other storeys. It contains the boiler and engine-houses, disinfectant, accumulator-room, laundry, stables for cows and horses, and residences for the remaining staff and female servants.

I conclude the description of German sanatoria with that of the Nordrach colony in the Black Forest, nine miles from the little station of Biberach. To describe this colony one must picture the locality. The road from the railway ascends, and for some miles follows the river Hammerbach. The scenery is beautiful. On either side the hills covered with trees slope up from the river, sometimes gently, sometimes in bold escarpments. In the grey distance they rise to small mountainous heights dotted everywhere with trees, save for patches of greensward. In the midst the rapid river sparkling in the sun, which on the day of my visit also glistened on the snow-clad trees. Rising ultimately to a height of about 1,500 feet above the sea, we passed through Nordrach, and some half-mile or more beyond we come to Dr. Walther's famous colony for consumptives. Here there is no sanatorium proper, but many small buildings dotted about the hill-side. We alight at one containing the office and kitchens, with a long dining-room for patients attached—a wooden structure, simple enough in character, with windows on both sides—and a gravel terrace on one side. High up the hill to the left is the largest building of three storeys, containing rooms for twenty patients. It consists of a long centre, with two short wings at obtuse angles of some 190 degrees, so that they face to the S.S.E. and S.S.W. At the intersection of the angles are hexagonal turrets. There are two staircases. In this building, as in the others, each patient has a separate bedroom of about 50 cubic metres capacity. All have single casements with fan-lights, which latter are hung at the top and open outwards. There are balconies to some of the rooms. Each bedroom is fitted with a douche bath supplied with hot and cold water; there are only two slipper baths altogether, and these are solely used for medical purposes; there is one w.c. for every ten patients placed within the building. The floors are of wood covered with linoleum.

The walls and ceilings are of narrow boards, beaded not only at the edges but on the solid parts, and there is a moulded wooden cornice; there are no concave angles. It is strange that all canons of smooth surfaces and rounded angles are here set at naught; the explanation probably is that there is no dust in the place. I have before noted that each bedroom is fitted

\* A paper by Mr. Edwin T. Hall, F.R.I.B.A., read at the Congress of the Sanitary Institute at Manchester.

with two lavatory basins, one for washing, one for sputum. There are a few ordinary summer-houses in the grounds.

Another building of two storeys is provided for sixteen patients, and the rooms are only about 8 feet high. It is not only electrically lighted, but heated by electric radiators of the doctor's own manufacture. The medical staff consists of Dr. Walthers and another physician of equal standing; there is a secretary; there are no nurses as such, the doctor holding that nursing, as we know it, "ought to be done by the medical men;" there are two female servants to every ten bedrooms. In parenthesis it may be interesting to know that Dr. Walthers strongly objects to the Plenum system of ventilation, about which we have lately heard a good deal, of which he has had experience.

There are various other buildings forming the colony, dotted about here and there. Among them is the doctor's house, with the sitting-room made so that in the summer one external wall or enclosure can be completely removed. It will be seen from the foregoing that Nordrach has nothing of the structural sanatorium about it. It is a hamlet on a mountain side, "far from the madding crowd." Nature provides varied refreshment for the body and mind. For the rest, it is a little world where patients place themselves under a medical man of strong masterful personality, who orders their being generally. To live in such a position a life of simplicity under hygienic rules, to have no cares and to be interested, is to be, as nearly as our mortal frame will permit, free of disease. We have, however, to deal not with such an ideal place and life, but with the work-a-day world. For ordinary mortals, and specially for those of our poorer brethren, we must bring to their aid everything that sanitary knowledge of building can give.

It may now be of interest to briefly describe a few modern English institutions. I have had the pleasure of visiting the sanatorium near Crookesbury Ridges, under the direction of Dr. J. Rufenacht Walters. The sanatorium consists of two one-storeyed pavilions, one of eight and one of twelve single bedrooms facing south, all with French casement windows opening on to a verandah, canvas covered, for reclining couches; corridors run the whole length behind the rooms. There are two nurses living in the buildings and one masseuse. The cubic capacity of the rooms per patient is about 1,100 feet; the floors are of wood covered with linoleum; the walls and ceilings are of plaster with slightly concave angles. The ventilation is by the windows, by inlet tubes and by shafts at ceiling level across the corridor to the north. In the newer eight-bed block there are fanlights to the doors, so that all the room may be scoured with air; there are four bath-rooms, two having needle baths; the dining-room is attached to the older pavilion opening from the corridor, and beyond it are the kitchen and offices; the heating is by hot-water radiators; the lighting is by electricity. It might here be opportune to consider the question of the best position for Liegehallen or reclining verandahs. There is some difference of English medical opinion on the subject. It is held by some, and it seems to be a sound doctrine, that if patients are so delicate that they must lie down the greater part of the day, they should be as near to the medical man and to their own bedrooms as possible, so as to save the strain of even a short walk. In three of the five typical German buildings described, the Liegehallen form verandahs to the actual buildings, and the convenience of these is approved by the medical chiefs of all. In one of the others there are reasons of planning why this cannot be done. At Crookesbury Ridges the same verandah scheme is adopted and approved.

A larger institution is that called Pinewood, at Wokingham. This has accommodation for sixty-four patients, each in a single bedroom of an average cubic capacity of 1,100 feet. The institution consists of a central block of three storeys containing the consulting-rooms, offices and dispensary, with residences for the medical staff above. Detached from this on either hand is a patients' block of two storeys, each block containing thirty-two single bedrooms. These blocks face S.S.E. and S.S.W., and each has a corridor on the inner or northern side. There is one staircase in each. The ground floor walls are of brick, the first floor is enclosed by wood framing covered with boards and tiles. There is one resident nurse in each block. The douche and slipper bath-rooms and w.c.'s are on the north side of the corridor, and open directly from it. The windows are single casements which do not reach the ceiling. The doors have no fan-lights. There are no verandahs or balconies. The floors are boarded and covered with linoleum. Walls and ceilings are of plaster. There are concave angles, except to floors, where angle fillets are fixed. The heating of rooms is by open fires, that of corridors by hot-water radiators. Lighting is by electricity. The administrative block is detached to the north; it contains a handsome dining-room, with service and nurses' rooms attached, kitchen and offices (with female staff bedrooms over) and other rooms adjacent. There is a laundry block with disinfectant, an engine-house, stables, &c.

I may now perhaps describe a sanatorium which the

Brompton Consumptive Hospital is erecting at Frimley, in Surrey, from my designs. It is to accommodate 100 patients and unlike the others it is for non-paying inmates. The site is high and well wooded with fir trees. There are forty-eight single bedrooms, eight with two beds and twelve with three beds. Every patient's room will face S., S.S.E., or S.S.W. Outside the central block is a wide paved terrace. It will be noted that we have provided a large number of single bedrooms and in other rooms have fixed our maximum at three beds. Many of the German doctors with whom I have discussed the question favour this as the maximum. The sanatorium proper or patients' block, consists of a central building three storeys high with four radial wings or pavilions two storeys high, all built of brick, the upper storey tile-hung on the brick, the roof being also tile covered. All wings are practically detached and in a pine country this tends to limit the risks of fire and consequent danger to patients. By this arrangement of plan any one floor of the two or four wings may be appropriated to women, leaving the others for men; each group is self-contained with its separate sanitary conveniences. This plan also affords much greater facilities for classification than could be found in one building of the ordinary type. The main entrance hall is in the centre, and behind it is a day-room facing south with two three-bed wards at the sides. East and west of the hall are the consulting and matron's rooms, dispensary and sisters' duty-room. The first floor has similar patients' and sisters' accommodation, a committee-room, a residence for the matron, rooms for the sisters and a maids' room. Overhead, in the roof, are bedrooms, &c., for female servants, with their bath-rooms, &c. The pavilions are connected to the centre by enclosed corridors having windows on both sides. Each wing contains twenty-two beds. The corridor on the north side has no obstruction whatever to light and air.

Opposite every room door there is a window in the corridor, and as all doors have fan-lights carried, like the windows, to the ceiling, we shall get thorough ventilation, and even on hot sultry days the cooler air on the north side of the building will induce a current to the hotter south side. The windows are casements, those on the ground floor opening to the floor so that if necessary beds may be wheeled out. The casements on the ground floor are so constructed as to keep out rats and other vermin while the windows may remain wide-open. On the first floor there will be outside jalousie shutters, which can be closed either to exclude rain or intense sun heat, the windows remaining open. On the ground floor rolling canvas blinds, like those over shops, will effect not only the same purpose, but will shelter beds or couches outside. By this means we get the advantages of a verandah without any of its drawbacks. On each floor are large linen rooms, and on the ground floor are boot rooms. Between each pair of pavilions is a sanitary tower, detached except for a cross ventilated lobby. This contains all the patients' w.c.'s, baths, lavatories and housemaids' closets. For the nursing staff on duty separate ward kitchens, lavatories and w.c.'s are provided on both floors. There are separate entrances to each pair of pavilions, two main staircases, and at the outer end of each pavilion a fire escape staircase. The heating generally will be by hot water, the lighting by electricity.

The floors will be of wood covered with linoleum, and all walls and ceilings will be of plaster with concave angles everywhere. To the north of the sanatorium proper are the two patients' dining-rooms and a general assembly hall. Behind are the kitchen block, female servants' hall, men's rooms, &c. At the east end is the nurses' home, at the west the medical officers' and men-servants' residence. Nearer the main road are the laundry, boiler and electrical engine-houses, electrical ambulance house, mortuary and gate lodge. There are two laboratories.

I also show another of my designs for a rather smaller institution for paying patients, all having separate bedrooms. This is intended for males and females in equal numbers. Each side is separately entered, is self-contained, and has its separate recreation-room and writing-room or library. The central hall is arranged as a common-room for concerts or assemblies, and a billiard-room is provided on the first floor. Each wing consists of two floors of twenty-two rooms with principal and emergency staircases at either end and two sanitary towers, one containing w.c.'s and lavatories, the other baths and hair-dressing rooms. In the centre is a separately entered staff annexe, with linen-room, larder, &c., in close proximity to the nurses' duty-room. The rooms are in single file, every one with a sunny aspect, their construction following closely that already described. To the north of the main block is one large dining-hall for all patients, separated from the kitchen block by a serving-room. The kitchen forms the centre of another block, and around it are grouped dining-rooms for male and female servants, the stores, scullery, larders, &c. The residence of assistant medical officers and men servants is to the west and that of the nurses to the east. The medical superintendent will have a separate house.

Lastly, may I be permitted to refer to the new Camberwell Infirmary in course of erection from my designs? There will

be 800 beds in the institution. My reason for mentioning it here is that the Board of Guardians have, on the advice of the medical superintendent, Dr. Keats, and myself, made special provision for tuberculosis patients. We have three large wards of twenty-four beds each, in which practically the whole length of the walls on three sides is made to open, so that the patients may be said to lie in the open air, and above the wards are flat roofs with easy access, so that some patients can be actually in the open air all day long.

As far as I am aware, this is the first poor-law institution in the kingdom where this has been done, and we hope it may be the means of bringing open-air treatment to the poor at their own doors in a practical way.

In conclusion, I hope that in laying before you practical examples of many erected buildings you may have been interested in a way that a merely theoretical treatise could not interest you. You have seen very varied types of buildings and among them some of the most recent.

The principles laid down are submitted with all diffidence, but they are the result of close personal study of the subject and of the best modern buildings and conferences with the experienced medical officers who manage them. I trust that so much detail has not wearied you, but my wish has been to lay before you all the information in my power.

### THE PROVISION AND CONSTRUCTION OF SANATORIA FOR PULMONARY TUBERCULOSIS.\*

THE present-day treatment of tuberculous diseases of the lungs, commonly called consumption, is radically different to that formerly in vogue, when patients were protected from the imaginary dangers of fresh air, and were compelled to spend their days in an impure and overheated atmosphere, in which their vigour and strength progressively departed. As there was no knowledge of the causes of the disease, no precautions against infection were taken, and the unhappy attendants who had to breathe the vitiated and used-up air of the foetid sick room frequently themselves fell victims to the innumerable bacilli which swarmed in the dust of the room. Dr. Buhmer, of Gorborsdorf, in 1859 first practically demonstrated the value of fresh air by the successful results obtained in his sanatorium, and many sanatoria have been established abroad, and latterly in our own country on the same lines.

In such institutions the patient spends his whole time in the fresh air, protected from winds and draughts. Rest, both mental and physical, is insisted upon with judicious overfeeding. The discipline enforced is of the greatest value, and the whole of the patients' existence is regulated and supervised by his medical director, whom he learns to obey implicitly.

An ideal sanatorium cannot be designed on a cramped site, and not only should the site be ample enough to allow the buildings to be arranged to the best possible advantage, but there should also be grass land around to insure the absence of dust and to afford room for walks and exercise. A sanatorium for consumption must be considered as a specially designed hospital in which an infectious disease is to be treated.

"In order to facilitate the maintenance of healthy conditions in a hospital the form of the building should be such as to insure the provision and proper application of (1) fresh air, with the necessary warmth and coolness; (2) ample light, including the penetration of sunlight to every part; (3) purification of floors and walls." These words of Sir Douglas Galton will apply with even greater force to sanatoria, and in an ideal building the following requirements are essential:—(a) Free play of sunlight upon each room and block of buildings provided for the patients' accommodation. (b) The freest possible circulation of air around each building, and the avoidance of all enclosed spaces in which air would be liable to become stagnant. (c) Ample space between the various buildings. (d) Facilities for enabling the patients to spend the greater part of each day in the open air. (e) Sufficient compactness of plan to allow of all departments being placed within reasonable distance of the administrative centre, which should be separated from the patients' quarters. (f) Isolation of the engine and boiler house, the laundry, mortuary and other subsidiary buildings. (g) Departmental separation of male and female patients, whose quarters and exercise grounds should be placed on either side of a central administrative block.

Most of the sanatoria which have been built abroad fall very short of the ideal. Large piles of buildings have been placed on limited sites, and although imposing and grandiose, lack the essential qualifications of allowing free circulation of light and air. Such sanatoria resemble nothing so much as palatial hotels, and however skilfully they may be planned and

however pleasing may be their appearance, they are rightly condemned by present-day opinion. It is, however, a fact that a design which admits of a striking elevation will always command support, however imperfectly the objects are subserved for which the building is intended, and quite recently, in one of the medical journals, a most laudatory account of the Wehrawald Sanatori was given by an eminent physician, who described this sanatorium as ideal, although it is five storeys in height and includes all the defects of a palatial hotel, both as regards ventilation and overcrowding.

Fortunately the expense of building such palatial sanatoria militates against their adoption, and through lack of money public bodies may be induced to build cheaper and more perfect sanatoria.

The best type of sanatorium for small numbers probably is one built on the village system in which the patients live in detached chalets, which are grouped around a central administrative block. Not only is free circulation of air and light promoted, but there is no institution look about the place. The patients feel more at home and scarcely realise that they are in a hospital. But such a plan is not the best for a sanatorium containing 100 or more patients, as the labour of supervision and administration in a public institution consisting of a multitude of detached units, together with the expense of maintenance, would be prohibitive.

A compromise may be effected by planning a series of pavilions, each consisting of a one-storeyed row of single rooms, completely surrounded by a verandah, with their long axes radiating from the central administrative block with which they are connected by a wide open corridor. Such a sanatorium has all the advantages of free circulation of air and light which the sanatorium of the "village" type possesses, while it is as easily administered and supervised as a large hotel.

The drawings which we exhibit to-day constitute an attempt to design a sanatorium of this type, to give accommodation to eighty-eight patients of the usual hospital class, and to twelve paying patients who require better accommodation.

Provision has been made for an administrative block, arranged with the object of interfering as little as possible with the free circulation of air and sunshine. The front is two storeys in height and has a southern aspect. Behind this building is a long range of one-storeyed buildings, the principal rooms of which are lighted by lantern lights in addition to the usual side windows. The boiler-house, laundry, &c., forming the centre of the semicircular plan, are placed at the extreme north end of the central block. Then pavilions containing sleeping-rooms radiate on either side, and an open corridor connects them with one another and with the administrative building. Twelve separate chalets for the accommodation of better-class patients are placed between the pavilions and the front administrative building.

The stereotyped design seen in so many asylums and hospitals has been carefully avoided. A good æsthetic result may be obtained without the employment of costly stone quoins, cornices, and so-called enrichments. The bungalow type of building appears to be the best for our purpose and the elevations conform to the plan. Without going into detail we may say that in a sanatorium all the usual precautions against dirt and dust, such as rounded corners, hard impermeable walls, terazzo or teak flooring would be required. We have time only to give a very hurried sketch of the plan.

In the front administrative block on the ground floor spacious dining, drawing, reading and recreation-rooms for the use of the better-class patients open into a large central hall. On the first floor are bedrooms for the matron and nurses, and on the attic floor, approached by separate staircases, sleeping accommodation is provided for the servants of either sex.

The kitchen occupies a central position between the dining-rooms allotted (a) to the patients, (b) to the nurses, and to the servants. An extraction fan placed in a large lantern light insures thorough ventilation, and in order to obviate the possibility of any cooking fumes permeating into the adjacent passages, it is approached through well-ventilated lobbies, placed at either end, and forming the necessary serving rooms in connection with the kitchen. On either side are the necessary provision and store rooms, and surrounding the building in front is a wide covered verandah, which is prolonged on either side into a raised terrace. On the west side an annexe is provided for medical work. This comprises patients' waiting and dressing-rooms, consulting-room, and an inner room for physical diagnosis. On the opposite side of a central passage are the laboratories, together with a dark-room and an animal-room. Overlooking the terrace are rooms for an assistant medical officer, and the dispensary and general office. On the east side a corresponding annexe contains the nurses' dining and day-rooms. Dining-rooms for the patients and servants, recreation-rooms, including a library, a large winter garden, and a chapel are provided in the main central block. The main corridor is centrally placed, and connects the pavilions with one another. This corridor, open at the sides, is on the same

\* A paper by Mr. A. W. S. Cross, B.A. Cantab., F.R.I.B.A., and Mr. A. G. Walsford, M.D., read at the Sanitary Congress, Manchester.

level as that of the floors of the pavilions, and beneath it is a subway for pipes, &c.

On either side of the administrative buildings three separate pavilions, each containing 15 rooms, are placed with their long axes radiating from the centre of the plan, and planned as separate and independent blocks, communicating by an open covered way with the main corridor. Each room is provided with an open fireplace. Each pavilion is surrounded by a wide verandah, and the rooms open on to it by French windows or doors, which to prevent direct draught may be double, as efficient ventilation is assured by windows consisting of fixed glass louveres above the verandah roof. As these cannot be closed constant and efficient ventilation is provided without the use of pipes and tubes which collect dust, and are often worse than useless. Outside the windows jalousie framed shutters are provided for use in very boisterous weather.

The verandah is enclosed with glass at one end, to form a sun room, but with this exception it is entirely open, and unless the weather were very inclement the windows of the sun room would be always open. The verandah roof is glazed with thick unpolished plate-glass, through which the sun's rays will not penetrate with full force. Each room has a floor area of 15 feet by 12 feet and a clear height of 14 feet. This gives a cubic capacity for each patient of more than 2,500 feet.

Each pavilion practically consists of a row of one-roomed chalets, the verandahs of which communicate. This gives the opportunity to patients to obtain the full benefit of the open-air treatment as regards sunshine and fresh air. The better-class patients are housed in separate chalets.

Between the pavilions and the main building is a building containing a douche-room and a room in which special inhalations can be given. A glass room for the sun-bath treatment is provided. Fronting the main back road is a detached building containing the boiler-house, pump-room, the laundry and the disinfectant and destructor. Surrounding the boiler-house and laundry block is a wide road for vehicular traffic, in connection with which is a branch inclined roadway, leading to a subway connecting the back with the front of the administrative buildings. The subway runs from north to south, and is of sufficient width to allow of a trolley service for the carriage of coals and provisions which would be brought in at the back entrance and conveyed to the kitchen.

The open corridors afford ready access to all parts of the sanatorium without interfering with the circulation of air. The principal medical officer's house is within easy reach of the sanatorium, but separate from it. The grounds would be laid out with covered and open, level and inclined paths, and with the usual desiderata of a well-appointed sanatorium, into the details of which we cannot enter now.

From this hasty account it will be readily seen that in such a sanatorium the open-air treatment can be thoroughly carried out. As one-storeyed buildings can so easily be ventilated there is no necessity to forbid the provision of recreation-rooms, which in our climate are a necessity. The recreation-rooms provided for in our plan are so thoroughly ventilated that no objection can be raised to allowing patients to use them at any rate during part of the day.

While we have designed a sanatorium on a large scale it is obvious that, without departing from the spirit of the plan, the sanatorium may be made much less expensive by omitting to provide so many recreation-rooms. A sanatorium built on the plan suggested can be made as simple and as small or as large as is required, and meets all requirements, while, when compared with sanatoria of the "palatial hotel type," it compares very favourably as to cost. No doubt the area covered by the buildings is large; but this is desirable, as free circulation of air is necessary. The spaces intervening between the buildings should be laid out with walks and as gardens, so that the whole will have a most pleasing appearance.

## GENERAL.

**The Design** by Mr. D. Forbes Smith, A.R.I.B.A., has been unanimously selected by the Kirkcaldy and Dysart Landward School Board for a new school at Boneland in a competition limited to the architects of the district.

**The Bruges Exhibition** of early Flemish art, which was to have closed on the 15th inst., is to remain open till October 5. This is the consequence of its very great success, which has been most remarkable. Lately the visitors have numbered 500 or 600 daily, and the town has been crowded throughout the summer.

**Percy Broughton**, who pleaded guilty at Belfast to stealing several South Kensington Museum art treasures from the local free library, was liberated last week under the First Offenders Act.

**Falguière's Statue of Balzac** has been erected in the street bearing the novelist's name, where he lived, but it will not be unveiled till next year.

**Sir John Knill** was elected Master of the Worshipful Company of Plumbers on Tuesday for the ensuing year. The other appointments were Mr. Robert Crawford, Warden, and Alderman Richard Hind, Renter-Warden.

**The Street Improvements** in the neighbourhood of the French Institute in Paris, which would require a new bridge over the Seine as part of the project, are not likely to be undertaken at present.

**The Woolwich Town Council** is about to complete the purchase of the works and undertaking of the local electric lighting company. In accordance with the contract already signed, the purchase price is 101,000*l.* This sum will be sufficient to return to the shareholders considerably over 2*l.* for each 1*l.* share.

**M. Gustave Wertheimer**, the French animal-painter, has died in a Paris hospital of consumption.

**The Excavations** which are to be made at Bury St. Edmunds are undertaken for the purpose of discovering the crypt in which the body of St. Edmund was buried by the monks when they were warned of the coming dissolution of the monastery.

**The Acme Wood Flooring Company** announce that notwithstanding the fire at their Victoria Dock wharf and saw mills, the execution of orders in hand and the booking and carrying out of further orders will in no way be interfered with, arrangements to insure this having been made at other mills.

**The First Section** of the new St. Matthew's Church, Southsea, which will accommodate a thousand people, was formally opened on Saturday night at eight o'clock with solemn evensong and procession. There was a large congregation. Mr. J. T. Micklethwaite, F.S.A., is the architect of the church.

**The Natal Government**, it is said, is about to spend 50,000*l.* on public buildings in Vryheid, which was recently annexed from the Transvaal. These are to comprise a new court-house, new post and telegraph offices and other buildings, including a police-station and charge office.

**Messrs. Colson, Farrow & Nisbett**, architects, request us to announce that they have removed from New Court, Carey Street, W.C., to 29 New Bridge Street, E.C., and that their telephone number is now 741, Holborn.

**The Ashwell Rural District Council** have resolved to appoint a parochial committee to carry out the water and drainage schemes for Ashwell prepared by Mr. J. R. Elliott, A.M.I.C.E., of Nottingham. The schemes have been unanimously approved by the Parish and District Councils, and application has been made for a loan of 5,000*l.*

**A Permanent Seamen's Institute**, for the use of sailors who are for the time being in Manchester, which takes the place of a temporary institution which has been in use for eight years, was opened by Lord Inverclyde on Wednesday in Trafford Road, Salford. The new building, which is exactly opposite the principal entrance to the docks, includes a large hall on the ground floor, with a commodious chapel above it, and there are in addition an officers' room, a classroom, mission-room, library and kitchen. The building was designed by Mr. Medland Taylor and is lighted by electricity. It was estimated to cost about 5,000*l.*

**The Bishop of Chester** (Dr. Jayne) visited Calday Grange grammar school, West Kirby, on the 24th inst., and formally opened the extensions which have been recently carried out at a total cost of 3,000*l.* The additions comprise a fine classroom, 66 feet by 24 (convertible into three rooms), and certain enlargements of the old rooms.

**At a Meeting** of the Stoke-on-Trent Board of Guardians on Wednesday a letter was read from the Local Government Board approving of the plans relating to the proposed reconstruction of the workhouse at a cost not exceeding 32,600*l.* The chairman proposed that application be made to the Local Government Board for sanction to borrow the amount required.

**The Borough Engineer** of Southend-on-Sea has submitted to the highways and works committee of the Corporation a scheme for widening the Marine Parade and the construction of a marine lake and pleasure grounds. If the works proposed by Mr. Alfred Fidler, the borough engineer, are carried out, the Parade would vary from 70 feet to 140 feet in width, and stretch from the Southchurch Beach Road on the east to Champ's Restaurant on the west, a length of one mile. The scheme includes the reclamation of a portion of the foreshore, on which would be constructed the marine lake and an open-air bathing-place. There would also be gardens, greens, shrubberies, band stands, shelters, &c. Sites would likewise be available for the erection of baths and other buildings, an Eiffel tower and big wheel. The finished level of the reclaimed area would be a little above the present level of the foreshore. Mr. Fidler estimates that the whole of the works would cost 340,000*l.*, against which there would be a revenue of 20,000*l.*, leaving an annual profit, after repayment of loan and sundry charges, of 5,000*l.*

**EDITORIAL NOTICES.**

*In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.*

*The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.*

*The authors of signed articles and papers read in public must necessarily be held responsible for their contents.*

*No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.*

*Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.*

**TENDERS, ETC.**

*\*\*\* As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

**COMPETITIONS OPEN.**

**CAPE TOWN.**—Jan. 31.—The Council of the University of the Cape of Good Hope invite designs for the erection of university buildings. Premiums of 400*l.*, 200*l.* and 100*l.* will be awarded to the authors of the designs placed first, second and third respectively. Particulars of the competition may be obtained on application to the Registrar at Cape Town, or to the Agent-General in London.

**GREENWICH.**—Oct. 9.—Designs are invited for a public library (with chambers for chief librarian's residence) to be erected at a cost of about 6,500*l.*, with fittings, on a site about 7,000 feet super, in the borough of Greenwich. Premiums of 50*l.* and 30*l.* are offered. Particulars can be obtained on application to the Greenwich Borough Council.

**INDIA.**—Nov. 1.—Competitive designs are invited for the erection of a memorial to Her Majesty the late Queen Victoria at Allahabad. A premium of 2,000 rupees will be awarded to the design selected by the committee. Mr. H. Nelson Wright, Indian Civil Service, honorary secretary, Queen Victoria Memorial Fund Committee, Allahabad, India.

**MAIDENHEAD.**—Oct. 1.—Designs for free library. Premiums offered of £50, £20 and £10 respectively. Mr. John Kirk, town clerk, Guildhall, Maidenhead.

**NEWARK.**—Oct. 14.—Designs and suggestions are invited for alterations and additions at the infirmary, Bowbridge Road, Newark, comprising a board and committee-room, a new mortuary and provision for twenty extra beds. A prize of twenty guineas is offered for the best plans sent to the office of Mr. M. H. Colton, clerk, 27 Lombard Street, Newark.

**STROOD.**—Oct. 15.—Plans are invited for further hospital accommodation on a site recently acquired by the Strood Rural District Council in Whitehill Road, Cobham. A premium of 15*l.* 15*s.* is offered for the best set of plans submitted.

**CONTRACTS OPEN.**

**ALNWICK.**—Oct. 2.—For sanitary improvements at the workhouse. Particulars can be seen at the workhouse.

**AYLESBURY.**—Oct. 8.—For installation and maintenance of electricity for a term of years. Mr. Percy A. Wright, clerk, Town Hall, Aylesbury.

**BAGNALL.**—For erection of branch stores and four cottages at Bagnall. Mr. William V. Betts, architect, Bank Offices, Old Basford.

**BARNSELY.**—Sept. 30.—For erection of four dwelling-houses, shop and outbuildings in Tinker Lane, Hoyland Common. Messrs. Wade & Turner, architects, 10 Pitt Street, Barnsley.

**BARTON-UPON-IRWELL.**—Oct. 1.—For erection of the Godfrey Ermen memorial schools, Barton-upon-Irwell, Lancs. Messrs. Austin & Paley, architects, Castle Park, Lancaster.

**BOURNE END.**—Oct. 1.—For sinking a well near the railway station on the Great Western Railway. Mr. W. Vaux Graham, 5 Queen Anne's Gate, Westminster.

**BRANDON.**—Oct. 6.—For erection of a post-office at Brandon, Suffolk. Mr. James Farley, architect, Old Cross, Hertford.

**CHELMSFORD.**—Oct. 2.—For erection of county offices in Tindal Square, Chelmsford. Mr. Frank Whitmore, architect, Duke Street, Chelmsford.

**CHICHESTER.**—Sept. 29.—Contract No. 1, for construction of precipitation tanks, filters, boiler-house, pump-house, pneumatic ram pit, stable, cart shed and various other works in connection therewith. Contract No. 2, for construction, erection and setting to work of pneumatic forcing ram, sludge press and other machinery and appliances incidental thereto. Mr. J. W. Leader Cooper, town clerk, Town Hall, Chichester.

**CHICKENLEY.**—For erection of farm buildings at Chickenley, Yorks. Mr. Frederick W. Ridgway, architect, Borough Chambers, Dewsbury.

**CORNWALL.**—Oct. 6.—For alterations and additions to the Tinner's Arms, Zennor. Mr. N. C. Whear, jun., architect, Penzance.

**COVENTRY.**—Sept. 29.—For erection of a residence, St. Nicholas Street, Coventry. Messrs. Geo. & Isaac Steane, architects, 22 Little Park Street, Coventry.

**DERBY.**—Sept. 29.—For erection of a school on the Normanton Road. Mr. A. Macpherson, architect, Tenant Street, Derby.

**DERBY.**—Oct. 4.—For erection of (1) an isolation hospital to accommodate sixteen patients on land in Holmley Lane, Dronfield; (2) an isolation hospital to accommodate sixteen patients at Mastin Moor, Staveley; (3) an isolation hospital to accommodate sixteen patients in the parish of Morton, about one mile from Doe Hill station, Midland Railway. Mr. G. E. Bolshaw, architect, 189 Lord Street, Southport.

**DUDLEY.**—Oct. 11.—For erection of a new upper standard school, with caretaker's house, playgrounds, boundaries, &c., for the Dudley School Board. Messrs. Barrowcliff & Allcock, architects, Mill Street, Loughborough.

**CHIPS, DUST, SHAVINGS,**  
**STURTEVANT**

**ECCLES**.—Oct. 8.—For erection of a public mortuary proposed at the town's yard, Patricroft. Mr. Wm. Henry Hickson, town clerk, Town Hall, Eccles.

**FAVERSHAM**.—Sept. 30.—For erection of a proposed parish hall and other works in connection therewith at Faversham. Mr. W. J. Jennings, architect, Canterbury.

**GLASGOW**.—Oct. 8.—For alterations and additions at Dalhousie dépôt. Mr. John Young, general manager, 88 Renfield Street, Glasgow.

**GREENWICH**.—Oct. 14.—For erection of a weights and measures testing office, with stable building and a coroner's court in Lamb Lane. Particulars may be obtained at the General Section of the Architect's Department, 18 Pall Mall East, S.W.

**HALIFAX**.—Sept. 29.—For erection of shops in Horton Street. Messrs. Geo. Buckley & Son, Tower Chambers, Halifax.

**HALIFAX**.—Oct. 1.—For additions to laundry and erection of mortuary at the Borough hospital, Stoney Royd. Mr. James Lord, borough engineer, Town Hall, Halifax.

**HALIFAX**.—Oct. 4.—For erection of two semi-detached villa residences, Skircoat Green Road, Halifax. Messrs. Geo. Buckley & Son, architects, Tower Chambers, Halifax.

**HARROW**.—Oct. 14.—For erection of a court-house at Harrow, Middlesex. Mr. H. T. Wakelam, county architect, Middlesex Guildhall, Westminster.

**HATFIELD**.—Oct. 8.—For erection of offices and buildings for the county surveyor's department at Hatfield. Particulars may be obtained at the Herts County Surveyor's Office, 41 Parliament Street, S.W.

**HOLBECK**.—For erection of sixteen houses at Holbeck. Mr. Fred. W. Rhodes, architect, Upper Wortley, Leeds.

**HOOLE**.—Oct. 4.—For erection of walling and fencing around the proposed recreation-ground, situate between Canadian Avenue and Bater Avenue, Hoole, Chester. Mr. Arthur D. Caldecutt, clerk, U.D.C., 17 Newgate Street, Chester.

**HUDDERSFIELD**.—For supply of high and low-tension cable to specification. The Borough Electrical Engineer, St. Andrew's Road.

**ILFORD**.—Oct. 6.—For supply and erection of contract No. 1: Dry-back semi-marine type boiler (15,000 lbs. evaporation per hour), superheater and accessories, and motor feed-

pump; contract No. 2: steam, feed and blow-off pipes, and feed filter; contract No. 3: surface condenser, cooling tower, motor pumps, hot well, grease extractor, exhaust steam and water pipes. Mr. J. W. Benton, clerk, Council Offices.

**IRELAND**.—Sept. 29.—For supply of 50,000 best machine-made solid, compressed brick, delivered at the Belfast cemetery. Mr. Samuel Black, town clerk, Town Hall, Belfast.

**IRELAND**.—Oct. 1.—For erection of fourteen labourers' cottages (including out offices, piers and gates), and the fencing of the acre plots attached thereto; also for fencing twelve plots at Kinsale. Mr. R. Evans, engineer, 53 South Mall, Cork.

**IRELAND**.—Oct. 2.—For executing a scheme of water supply at Kinsale. Mr. R. Evans, engineer, 53 Southall Mall, Cork.

**IRELAND**.—Oct. 11.—For erection of a residence for the chief medical officer at the Castlebar District Lunatic Asylum. Mr. Joseph T. Kelly, clerk of asylum.

**LEICESTER**.—Sept. 30.—For erection of an octagonal brick chimney-shaft 180 feet high at the new generating station, the Lero. Mr. E. George Mawbey, engineer, Town Hall, Leicester.

**LIGHTCLIFFE**.—Oct. 11.—For erection of four houses near the Old Church, Lightcliffe, Yorks. Messrs. Joseph F. Walsh & Graham Nicholas, architects, Museum Chambers, Halifax.

**LISCARD**.—Oct. 11.—For erection of sand-drying kiln, stables, stores, &c., on land in Seaview Road, Liscard, Cheshire. Mr. H. W. Cook, clerk, Public Offices, Egremont.

**YALE AND TOWNE LOCKS AND DOOR FURNITURE.**

AMERICAN manufactures as a rule are distinguished, those of the better class, at any rate, by excellent and eminently practical design and accuracy of workmanship, and to this rule the goods of The Yale and Towne Manufacturing Company of New York, whose factory is in Connecticut, and who are represented in London by Messrs. Markt & Co., of 20 Chapel Street, Milton Street, Finsbury, form no exception. The specialties of this firm are architectural hardware, artistic metalwork in the various schools of design and periods, including door pulls, lever handles, escutcheon plates, handles, switch plates, hinge plates, &c., and in the manufacture of these it is not too much to say that they are *facile princeps*. Largely employed by the leading architects in the States in the finishing and embellishing of up-to-date mansions, hotels, public and private offices, institutions, &c, these goods are now being brought to the attention of the members of the architectural profession and building trades in England, by whom no doubt their merits will be speedily recognised.

Space will not admit of our giving an exhaustive description of the various samples which we recently had the

pleasure of inspecting, and unfortunately the illustrations which we are able to give fail to convey an adequate impression of the delicacy of some of the workmanship, but they show

a certain boldness and originality of treatment which is pleasing. This is especially noticeable in the illustration below,

of a kicking-plate which forms part of the furniture of a yacht cabin door, or that of a yachting club. These goods, which are in all cases stamped with the trade mark on the back as here given, are made in various metals and finishes—gold, silver, bronze, brass, copper, gunmetal or steel, and are distinguished by accuracy of fit and mechanism.

TRADE MARK.

The Yale locks are too well known to need any description. We may, however, say that The Yale and Towne Manufacturing Company can supply them for every imaginable purpose. They have also a variety of spring hinges, among which we may mention the Blount combined door spring and check. In

this the checking medium consists of a liquid (instead of air) which, being non-elastic, gives a smooth, steady and uniform motion to the door. The working parts consist of a metallic piston, without packing, moving in a metallic cylinder containing a non-freezing liquid. The movement of the door depends upon the escape or passage of this liquid from one end of the cylinder to the other, an important feature being that the working parts are thus always immersed in a lubricating fluid, and the piston requires no packing. We can recommend those of our readers who are interested in goods of this description to inspect the samples on view in Chapel Street.

#### TRADE NOTE.

MESSRS. JOHN WRIGHT & CO. (John Wright and Eagle Range Company, Ltd.), of Essex Works, Thimble Mill Lane, Birmingham, have just got out a new price list of their "Eureka" gas fires, which are depicted in various attractive forms, and at prices ranging from a few shillings to as many pounds.

#### ELECTRIC NOTES.

DURING the month of August 30,531 units of electricity were generated in Greenock and 25,613 were sold, being 12,938 more than for the same period last year. For traction 66,359 units were supplied. The applications for supply now number 287, which are equivalent to 38,289 eight candle-power lamps.

THE Colwyn Bay Town Council have decided to practically double the resources of the electric-lighting station, and the preliminary steps are being taken with the great improvement scheme sanctioned by Parliament this year. When the scheme is completed it will provide a promenade three miles long and a magnificent marine drive.

THE plans for the Manchester and Liverpool Electric Express Railway are, it is said, now quite ready, and an official announcement may be expected at no distant date. In the meantime the engineers are very busy on plans for the new London to Brighton and Dover mono-railway, and there is little doubt that a Bill will be proceeded with during the next session of Parliament.

# WAPICTI

## A SANITARY WASHABLE DISTEMPER OF BRITISH MANUFACTURE.

PRODUCES A MUCH MORE PLEASING EFFECT THAN FLATTED OIL PAINT, AT ONE THIRD THE COST.

KING'S COLLEGE SCHOOL, WIMBLEDON COMMON, S.W.

ST. DAVID'S CHURCH, BATHGATE.

CONGREGATIONAL CHURCH, FINCHLEY ROAD.

MAJOR STEWART, an inspector appointed by the Local Government Board, held an inquiry at Ashton-under-Lyne on the 18th inst. into an application by the Town Council for permission to borrow 30,000*l.* for the purposes of extensions to the Wellington Road Electricity Works, and other improvements in regard to the supply of electrical energy in the borough. The town clerk (Mr. Bromley) explained that the electricity committee contemplated a considerable extension of buildings and the installation of new machinery to meet the increase in demand for the current and the laying of additional mains. A sum of 19,382*l.* was to be spent in the first department, this sum also including the cost of two sets of generating plant and surface condenser. Evidence was given by the electrical engineer, Mr. Applebee, and Colonel Eaton, architect. A sum of 34,200*l.* has already been spent on the works.

THE electric-lighting committee of Edinburgh Town Council had again before it at a meeting the negotiations with the Caledonian Railway Company for the supply of electric energy for lighting and motive power for Princes Street station and hotel and for the adjoining goods yard. The parties have practically come to terms, and it was left to the town clerk to complete the bargain. The contract will be a beneficial one to the municipal undertaking, as the annual consumption will be about half a million units. Hitherto the Caledonian Railway Company have had a private installation, but that will now be abandoned. From July 18 to September 11 the applications for electric current from Edinburgh Corporation amounted to the equivalent of 13,777 eight candle-power lamps, of which 8,828 were for lighting, 4,035 for motors and 914 for heating. In the corresponding period of last year the total was 13,687 eight candle-power lamps.

## BUILDING AND BUILDERS.

WIGTON parish church (Westmoreland) is to be restored at a cost of 200*l.*

THE Barnsley School Board is about to apply for powers to borrow 1,350*l.* for erecting a temporary iron school, for use until the new school is completed, and for street-making.

AT Bolton foundation-stones of new schools were recently laid, one in the Victory district (Board school), the other a Wesleyan day school in connection with Victoria chapel.

THE foundation-stones of a new Primitive Methodist church which is being erected at Hall End, West Bromwich, have been laid.

THE foundation-stone was laid on the 17th inst. of St. Oswald's Church Institute, which is being erected in Church Street, Durham, from designs of Mr. Cowe. It is expected that the cost will amount to between 1,700*l.* and 1,800*l.*

THE magistrates of Aberdeen had a meeting last week with Mr. Matcham, architect, London, to discuss the plans of the proposed new theatre. The plans were approved. The building will cost upwards of 20,000*l.*

ON the 20th inst. the foundation-stone of a new Roman Catholic church was laid at Irlam, near Manchester. The new church is being erected at the corner of Astley Street and Liverpool Road, and will provide accommodation for 350.

THE village of Kempley, Gloucestershire, is to have a new church—it already has two—and the foundation-stone was laid by Countess Beauchamp on the 18th inst. It will be an attractive building, of Forest of Dean stone, capable of seating a congregation of 140, and will consist of nave and chancel, with a side chapel, vestry and porch.

THE Cheshire County Council is negotiating loans, amounting to some 90,000*l.*, to defray cost of various county works connected with lunatic asylums and police stations. A loan of 62,000*l.* is wanted for the cost of the new annexe at Parkside Asylum, and over 11,000*l.* is wanted for a new epileptic ward for the same institution.

THE foundation-stone of the Sir William Pearce Memorial Institute in Govan, the gift of Lady Pearce to the working classes of the burgh, was laid with Masonic honours on the 20th inst. by Sir William G. Pearce. Subsequently Lady Pearce laid the foundation-stone of the Macgregor United Free church, Govan, which is intended to commemorate the

The illustration below shows the same room with WILSON'S PATENT MULTILUX WINDOW fixed. This refracts the rays of light and throws them horizontally, thus preventing them falling on to the floor, and lighting up the whole room.

evangelistic work carried on among the Fairfield workmen by Mrs. Cunningham Burns Macgregor.

### VARIETIES.

A NEW iron bridge above the two old stone structures at Devil's Bridge, Aberystwith, has been erected by the County Council and the approaches are improved. The extra height of the new bridge gives an additional charm to the view.

A NEW Board school was formally opened at Ramsbottom, Lancs, on Saturday afternoon. It is excellently situated at Peel Brow, in the east ward of the town. It has accommodation for 600 scholars.

THE death took place on the 17th inst. in Staffordshire, at the age of sixty, of Mr. Hamilton Rendel, who until two months ago was at the head of the engineering department of the Elswick works, a position from which he retired owing to ill-health.

CARDINAL VAUGHAN has approved the plans for the erection of a new church at Shepherd's Bush, and building operations will be begun at once. A good site has been procured in Ash Church Grove. The nave and one aisle will be built first, and opened for worship.

At a meeting of the Aberavon Ratepayers' Association, it was decided that Messrs. W. H. Carney (Port Talbot Graving Dock Company) and T. B. Smith, architect, be asked to contest the Aberavon municipal election in the interests of the Association. Both gentlemen have consented.

THE formal opening of the new public baths at Atherton, Lancs, which have been erected by Messrs. S. & J. Whitehead, contractors, Oldham and Blackpool, at a cost of about 5,000*l.*, took place on Saturday afternoon. The internal arrangements of the baths are on modern lines. There are slipper, vapour and shower-baths for both sexes, and the swimming-bath is 75 feet long and 30 feet wide.

PREPARATIONS for the erection of the Queen Victoria memorial statue which is to be placed in Warrior Square, Hastings, are now well in progress. The statue is of bronze, and will be placed on a pedestal of massive red granite. Her late Majesty is represented as standing facing the sea, with the sceptre and orb in her hands. The total height of the memorial will be 17 feet.

WARRINGTON parish church has been recently undergoing considerable alterations and the Boteler chapel has now been reopened. The organ has been entirely reconstructed and removed from the west end to an arch between the Boteler chapel and the tower. The plaster has been removed from all the walls of the church and the stonework exposed. The seating accommodation in the Boteler chapel has been rearranged and an altar erected.

OUT of about fifty applicants, the following twelve gentlemen have been selected to form a short list of competitors for the post of town clerk of Gourock:—Charles P. McNeill (Greenock), Robert Reid (Alloa), John J. Colquhoun (Whithorn), James Marquis (Greenock), Colin C. MacCulloch (Greenock), William Nimmo (Greenock), A. Douglas Murray (Greenock), John D. F. Yuill (Glasgow), G. P. Anderson (Glasgow), William Hamilton (Edinburgh), George Dunlop (Gourock), and Duncan Kerr (Greenock). The salary is 150*l.*, with 20*l.* additional to go towards office rent.

THE Bishop of Liverpool, Dr. Chavasse, has laid the foundation-stone of a new church at West Derby, which will form a chapel-of-ease to the parish church. The new building is situated at the hamlet known as the Dog and Gun, about a mile and a half from West Derby village, at the junction of four cross roads—Carr Lane, Lowerhouse Lane and Derryhouse Lane. Designed by Mr. J. Oldrid Scott, son of Sir Gilbert Scott, the church will be of stone, in the Early English style, and will be of cruciform shape, with nave, apse, two transepts for the organ and vestries, and surmounted by a small central tower. The edifice is to accommodate some 300 worshippers.

THE Nurses' Home erected by the Guardians of the Stoke Union has been formally opened. This building, which is now ready for occupation, is erected on a site south of the general workhouse buildings, in a position which has the advantages of good prospect, good aspect and plenty of space. The home contains on the ground floor of the main or living block the various sitting-rooms, dining-room, writing-room, kitchen, stores, &c. The first and second floors are mainly occupied by bedrooms. The entrance and sanitary block is separated from the main block by a corridor on each floor. The whole is substantially built, the floors being fireproof and the staircase of concrete. The ventilation and general sanitation have been carefully looked to, the principal rooms being ventilated by electric power. The home is planned to accommodate twenty-four nurses. The cost is somewhat under 4,000*l.* Messrs.

Meiklejohn & Son, of Stoke-on-Trent, were the general contractors, and Messrs. Lynam, Beckett & Lynam, also of Stoke, were the architects.

A NEW gravitation water supply for the burgh of Galston, N.B., was opened last week at the reservoir on the farm of Passford, near Loudounhill. The magistrates and councillors of the burgh, with other friends, including the Town Council of the neighbouring burgh of Newmilns and Greenholm, drove up to Passford, where the ceremony of turning on the new water supply was performed by Mrs. White, wife of the Provost of Galston. Provost White gave a brief epitome of the origin and carrying out of the scheme. The reservoir, which is built of concrete, is 80 feet long, 40 feet wide and 12 feet deep, and has storage capacity for 200,000 gallons of water. Its height is about 424 feet above sea-level. The water is conveyed by 5-inch pipes to the lower end of Newmilns burgh, from which a previously existing 5-inch pipe conveys it to Galston. As the difference of level between the reservoir and the middle of the burgh at Galston is about 300 feet, the pressure is expected to be ample for all requirements. The work has been carried out by the firm of Messrs. W. R. Copland, water engineers, Glasgow. The estimates for the contract amounted to 5,500*l.*, but water claims and legal expenses will make the cost very much higher.

ACCORDING to the annual report just issued by His Majesty's consul at Rome, so many alterations and improvements have been effected in the city and its vicinity that visitors who have not been in Rome for the past twenty years can hardly recognise it. Suburbs have risen over the vineyards outside the city walls; old quarters have been superseded by large and commodious dwellings; the Tiber is permanently embedded all along its urban course between two gigantic embankments, on which fine houses overlooking the river have been constructed; solid granite bridges, meant to defy the ravages of time and the impetus of the once dangerous Tiber, have been thrown across the two embankments; new and wide thoroughfares have been opened; in a word, the city has been completely modernised and rendered in all respects quite sanitary, as shown by the returns of mortality. These facts, coupled with the traditional courtesy of its inhabitants, render Rome a most agreeable and healthy place of sojourn. Extensive excavations have lately been undertaken by the Government, especially in the area of the Roman Forum, and the results have amply justified the expenditure

and the labour involved in carrying out the plan of investigation proposed by the Archaeological Department.

THE masonry of Connel Bridge, which is built over Loch Etive, N.B., is well advanced, and the erection of the steelwork on both sides is now in progress. This structure forms a part of the Callander and Oban Railway extension from Connel Ferry to Ballachulish, and is certainly the greatest engineering feat ever attempted in the Highlands. The design adopted is that known as the cantilever, and when completed the clear span of 500 feet will be the second largest in Europe, coming next to that of the Forth Bridge. The navigation for small steamers and other craft to the upper reaches of the loch must, of course, be preserved, and the height of the bridge above ordinary high tide is to be 50 feet. Sir J. Wolfe Barry, K.C.B., Westminster, is the architect, and the entire superstructure will be of steel. In deference to representations made by the district committee of the Argyll County Council, an access for foot passengers will be provided across the bridge. This arrangement will involve the abolition of the awkward ferry at Connel. The Ballachulish line is twenty-six miles in length, and traverses a country which, owing to the irregularity of the coast-line and the numerous intervening arms of the sea, does not readily lend itself to railway extension. All obstacles are being, however, successfully overcome, and 75 per cent. of the permanent way has now been laid. Within twelve miles of Connel Ferry is the island of Seil, which was, although probably very few people are aware of the fact, the first island in Great Britain to be connected with the mainland by a bridge. The interesting specimen of Mediæval architecture, which consists of a single stone arch, is still absolutely flawless and substantial, and affords the only means of communication with the island.

#### THE SCIENCE OF THE WORKSHOP.

IN the Engineering Section of the meeting of the British Association a paper was read by Mr. W. J. Taylor on "The Science of the Workshop." After referring to the various materials used by engineers the author discussed the processes by which they were formed into machines or tools. As an example of a new departure he instanced the formation of a milling cutter between 3 and 4 inches in diameter, with deep teeth on its periphery and on both faces. This cutter had been formed cold from a blank of tool steel by hydraulic pressure. It was said to serve its purpose as well as any

cutter milled from a solid blank. In operations of this nature time was of considerable importance. Some remarkable work had been done, in connection with cycle-making and in other industries, in the drawing of sheet metals in the press. One of the limitations was the hardening of metal during treatment. In forging heavy masses of steel the element of time had been found to be of great importance. Small articles were produced satisfactorily in quick-acting drop presses; large masses demanded the slowly acting hydraulic press. In dealing with the problem of cutting action the author pointed out that cutting was largely composed of shearing. In turning mild steel, for example, the tool acted by compressing the material in front of it until rupture occurred by shearing in front of the chip. In an extremely plastic substance, or one which was both elastic and plastic, chips could be removed without shearing action because they would be sufficiently elastic or plastic to bend or flow without rupture and would permit the passage of the tool. In planing wood with the grain the chips would not be removed by intermittent shearing, but if ruptured at all would be ruptured by bending. Should rupture occur in advance of the cutting edge of the tool perfect cutting action would cease and rupture of the chip would not be an essential part of the cutting action. The author next dealt with the action of grinding machinery, pointing out that the removal of metal by abrasion at high velocities was probably largely due to the heating of particles removed.

### NATIONAL ASSOCIATION OF MASTER HOUSE PAINTERS.

THE annual convention of the National Association of Master House Painters and Decorators was begun on Tuesday in Newcastle-on-Tyne, Mr. J. Graham Cole, of Newcastle, presiding. After a municipal welcome by the mayor (Alderman H. W. Newton), the president said that in his visits to the local associations he was glad to see a general awakening to the fact that, if they wished to be respected and to have their work appreciated by the public, they must not only educate themselves, so far as the trade was concerned, and keep themselves abreast of the times, but they must see that those who were following them and taking their places were also educated. He had been delighted to find technical schools doing splendid work in most of the cities and towns he had visited and work-

ing under efficient masters of their craft. Up to the present however, the technical schools had dealt only with apprentices and he suggested that the time had arrived when they should institute continuation classes for those who had passed their apprenticeship. He was glad to know that his views in this matter were shared by the presidents of the Scottish and Irish National Associations. He suggested that in each town and city employers should call meetings of the operatives and confer with them, and so get their co-operation if possible. He had been pleased to see that great amount of attention given to colour studies at the various schools and exhibitions. The interiors of our homes were often spoiled for want of this knowledge. Students should study colour as if they were studying music. The decorator, who was a master of colour, not only had it in his power to make the home beautiful, but was a power also for dispensing happiness in connection with the work in the schools. He advocated the establishing of a first-class training national technical school in some central position in the country, saying that the reports received from such schools in Germany convinced him that such an institution would be of the greatest value to the craft. The present technical schools were, after all, only of an elementary character. An exhibition of decorators' work was opened by Mr. J. D. Crace, of London, president of the Institute of British Decorators, who said the Association had never taken up any subject more valuable than that of promoting the education of those who were to succeed them. It was impossible to exaggerate the value of technical schools, but only, he held, as supplementary to an apprenticeship. He did not believe that any youth would ever learn a trade by a technical school alone. In technical schools everything was made comparatively easy, but in apprenticeship the boy was left to his own resources, face to face with work comprising all the irregularities and possibilities of failure.

### THE AMERICAN WESTINGHOUSE WORKS.

IT is sixteen years, says a correspondent of the *Glasgow Herald*, since George Westinghouse decided to "play electricity for all it was worth." The Westinghouse Electric Company at East Pittsburgh is the greatest plant in America. The Westinghouse works at Old Trafford, near Manchester, is the greatest plant in England. East Pittsburgh is to-day the mart for ideas in electrical work. And here is a point which shows the type

man who directs these businesses. There are thousands of inventions, good in theory, which won't bear practical test. Most manufacturers being satisfied that an idea, however ingenious, is useless, would thank the inventor and say good-bye. Mr. Westinghouse, with the intuition of genius, often gets a patent that has been condemned. He has a body of men who do nothing but experiment. He takes an unworkable patent to a man. "The idea in this thing is all right, only it won't work in practice. I want you to put it right." And it is to be done.

We all know the name of Nikola Tesla, whom some in the scientific world regard as an electrical mountebank. Mr. Westinghouse cut through the flamboyant imaginativeness of Nikola Tesla and got down to the bed-rock of his theories. He saw that Nikola Tesla, behind all his firework talk, had brains. Patents of Nikola Tesla, regarded by many men as waste paper, Mr. Westinghouse bought. He handed over the gas to sound, level-headed electricians with the order, "Make them practicable." It was from the scoffed-at electrician that came the germ of the fundamental patents of the distinctive Westinghouse electrical apparatus in induction motors, and the use of alternating high-tension currents. At Niagara are several 100,000-volt transformers, turning the mighty falls into commercial value.

George Westinghouse, like all Americans, is always enthusiastic about something. He took up the Nernst electric lamp, which was nothing but a laboratory device, and made it practicable. He took to the making of steam-engines. He made the little steamer *Turbinia* that slices through the sea at forty-eight miles an hour. Natural gas was found accidentally in his works. He started making gas-engines. He has two power-houses, one of 750 horse-power. George Westinghouse is a believer in gas. He says that the economies which result from the distribution of power by means of gas generated at central points, and conveyed in pipes along the lines of railroad for the operation of engines and electric generators, would justify the expenditure of large capital necessary for such installation in connection with the electric equipment of railways, particularly on metropolitan and suburban lines. You see from this something of the energy, tirelessness of a typical American work.

The management of a great American business concern is carried to its finest point in these mammoth shops at East Pittsburgh. Take that great aisle. There was being built a generator 45 feet high, intended for the New York Rapid

Transit Company, a great wheel, sister of the pyramids in size and generating an electric current sufficient to drive 600 street cars. It was the biggest thing of the kind ever made. It was being tested and would then be sent in sections to New York. No railway truck could carry it, no tunnel could let it pass through. But the sections were as big as possible and made within 1½ inch of the largest tunnel aperture.

The whole floor was of steel with thousands of bolt holes. There were the colossal cranes. They were not swinging-work to the machines. The work was so big that in all cases the machines had to be swung to the work. Everything was driven electrically. Some of the "tools," as big as a cottage, were "self-contained"—within the frame they carried a motor, and it simply needed the fixing of a button to set the thing working.

I went among these "tools." They were all busy with an intelligence that made the layman wonder. Six or seven big "tools" were thundering and cutting, and not a man near. "Haven't you a man to look after these?" I asked. "Oh, yes," was the reply, "but I suppose he is busy just now doing something else." Throughout the works were 1,750 "machine tools," from delicate watchmaker appliances, turning out jewelled bearings for sensitive measuring instruments, to making the framework of electric cars weighing 50 tons.

To the first glance everything seems confusion. But look at the door at one end of the shop, and you see rough, ungainly parts being brought in. Look at the other and you see finished machines being packed on railway trucks and despatched to their destination. The whole thing is clockwork. The scheme is one of dates. An order comes in to the main office. It is handed on to the twelve men in the production department. Every section of the works is informed of what is required, not simultaneously, but at proportionate dates, sometimes six months from one to the other. Every day's work is arranged to a nicety, so that the men working in the middle of the shop won't get a pile of stuff ready and block the way long before the appliances are wanted.

The making of parts is specialised. Often a workman does not know what he is really making. But he delivers on a certain day, and on that certain day another department is just ready to receive and advance the work another stage. Such an immensity of work is done that it takes fully six months for a motor to pass through all its stages in that quarter-of-a-mile long shop. But each day from that one aisle there leave sixty 200 horse-power motors for street cars.

"The work of our designers is to simplify," I was told. "Electric appliances are not becoming more complex, but more simple."

That explains largely why of the 6,000 employées on this plant 1,200 are girls. It explains also how a man who was a clerk six months ago is now working in an electric shop; how, when a man is dismissed from watching a machine that punches holes, he is soon expert enough to look after a machine that cuts a groove. The standardisation of parts and the devoting of years to making the same small thing have the effect of converting men into machines and the machines into intelligent workers. You get men who work like lightning, but there is little of the artisan about them.

Yet there is room for brains. A man who can devise an improvement in a machine which will reduce cost and produce more—he is the man worth anything. The American working man knows this. He has largely got rid of the old-fashioned idea that he is doing an ill turn by displacing labour. He is doing a good turn for himself, and this is the thing that counts. An employer thinks little of a man who has no suggestions. The management are all eyes for the clever man or boy. There is no room for grumbling that a man does not get a chance. If a man misses chances in America he lacks the brains. All this is understood. When an American working man sees another do something ingenious he is positive he can do it also. Anyway, he tries. If he fails he knows the reason.

Specially did I inquire into the conditions of labour in the Westinghouse Electric Company. I saw that the secret of the enormous output was due to three things—standardisation, labour-saving machinery, enthusiasm of the men. There were a good many Englishmen employed. In regard to them it was the same story I had heard elsewhere. On their first coming they were slow. They were jacks-of-all-trades in electricity and master of none. But when they dropped into American ways of focussing all their energies on one thing they were able not only to hold their own, but often to beat the Americans.

One of the most interesting of men is Mr. Philip Lange, the manager of the works, who began, as most managers do in the States, at the bottom. He is a German, but with all the phlegmatic Teutonism soaked out of him—a man all nervous vitality, whose fingers are ever on the twitch, whose round grey eyes are ever on fire, but on whose features are the taut lines of years of anxiety.

We discussed the problem of labour, how most could be

got out of a man, and how was he entitled to be paid in the days of commercial warfare?

Fifteen years ago Mr. Lange began grappling with capital and labour issues. As far as the Westinghouse firm concerned, he thinks he has solved the riddle.

At first all the Westinghouse workers were paid day wages. He came to the conclusion that men, assured of a certain wage, were not putting forth all their energies. Then the piecework system was adopted. That didn't satisfy him. Men produced a little more, but not much. He decided that there was "soldiering" men were not earning all they could by piecework. "Ca'd canny," because they were suspicious that if they earned high wages the piece price would be cut, and they would be coaxed into still more hustle, which would mean still another cut. Then he adopted the premium plan. He called all the men together and said that on the basis of their piecework they would get the same pay for the same amount of work, but they could do in eight, or seven, or six hours what had previously taken them ten hours to do, then all they made in the remaining two, three or four hours—to make up the ten-hour day—they would get half and the company would get half. This was, in all truth, a premium on hustling.

Many of the workers hung back because they were suspicious of its being a scheme to see exactly what could be got out of men, and then cut their wages so that they would have to keep up a greater strain of energy to earn what they had previously earned with comparative ease. Mr. Lange, however, made a bargain. He gave a definite undertaking that he would not cut for a year, and there should be no cutting then if trade continued good. He talked business and not philosophy. He wanted to make more money for the company, he wanted to produce things cheaply, which he could do by obtaining several hours at half the previous rates; he wanted to get all the work he could out of the men, and for the benefit in their week's earnings for the same number of hours' work, without a dread that it would be said they were making too much.

For six years now the scheme has been in operation in all the machine-shops. It has worked admirably. With a single Mr. Lange told me that most of the piecework formerly done in ten hours is now done in seven, and in some cases the time has been cut down to even four hours. Yet for the four hours' work the man gets the pay he formerly got for the full ten hours' work; turning out twice and a-half as much as formerly he gets nearly twice as much in wages.

Published EVERY FRIDAY by GILBERT WOOD &  
LTD., at the Offices, 6-11 Imperial Building, Lud-  
low Circus, London, E.C.

The other day a foreman came to me and said that one of men was earning too much. He was making 63 cents (7<sup>1</sup>/<sub>2</sub>d.) an hour, while three men alongside him doing the work were making 34 cents (1s. 5d.) an hour. Now, that tremendous wage for a mechanic—24s. a day. I wouldn't n to the talk about cutting his wages. If I had done so confidence the men now have in me would be gone. It is r present confidence that makes them press every nerve the service. And what reason have I to complain? old that we had hundreds of men earning 63 cents an hour. e that under my 50 per cent. premium arrangement the e they earn for themselves the more they earn for the firm, the men see that the more they turn out for the firm the er it is for themselves."

"And what use do they make of their high wages—do they ?" I asked.

Mr. Lange smiled, and then he laughed. "When an lish or German workman comes to this country and brings wife with him he will have a banking account in six months, own his own house within the year. But if he comes here marries an American girl—why, he'll never know what a king account looks like."

## PROPOSED COLLEGE OF SCIENCE IN DUBLIN.

Monday a deputation from the Dublin Corporation waited e Chief Secretary at Dublin Castle to urge the desirability proceeding without delay with the Bill proposing to olish a college for applied science in Dublin.

Mr. Thomas Pile said the Corporation were anxious with rd to the present position of the Bill promoted by the ernment with a view to expend 280,000l. on a College for ied Science in Ireland. They believed that the Govern- ment would find amongst the architects of Dublin men quite l to the erection of any such building as the Government it require.

The Chief Secretary said that the Bill passed the second ing, and is still alive, though in a state of suspended ation. The present Bill could, therefore, be passed during utumn session. Mr. Austen Chamberlain, at that time ncial Secretary to the Treasury, proposed referring it to mmittee. Unless the Bill go to a committee its chance eing passed during the autumn would be very slight. e would not yourselves be prepared to see this Bill in-

definitely postponed upon the question of a site. You would not yourselves be prepared to see this Bill indefinitely postponed on the question of an architect, though I gather from you, and I take a note of it, that an architect can be found in this city competent to undertake a task even of its importance. You have mentioned a figure of 280,000l. The Bill provides only a sum of 225,000l. for this specific purpose, the acquirement of a site and the erection of a Royal College of Science, and such other public offices as may be determined—a site only and only a building for the college of science. The adaptation of the houses, which are not of so palatial a character as to stand in the way of this scheme, may be provided for by a vote of 9,500l. upon the Public Works vote in ordinary committee of supply. The acquisition of so large a site would have been extravagant, unless we had also been able to contemplate utilising some portion of it for other purposes. At the present moment some of the officials of the Irish Government are not properly housed according to modern standards of the amount of cubic feet of air which ought to be given to any man who is doing hard and responsible work. Many of those who are in the public service of the country are not housed as well as any big captain of industry would house his own clerks. But by combining that also with the possibility of giving proper accommodation to some of the officials in the Local Government Board and making a general shunt around the offices, we were able to acquire the assent of the Treasury to a comprehensive scheme, embracing now three proposals—a proper college for applied science in Dublin, a proper habitation for the new department of agriculture and technical education, the two in close proximity, and certain changes in other offices which would justify the acquisition of so large a site, and the embarking upon what would otherwise be described as a somewhat over ambitious architectural scheme.

The site was selected in Upper Merrion Street because you have a lawn in front of Leinster House; beyond that you have the National Gallery, forming a kind of pendant to any such block of buildings; and then behind, forming part of the same architectural scheme, you have the buildings of the library and of the museum built by an Irish architect. It seemed to me, to Mr. Chamberlain and to Mr. Holmes, First Commissioner of Works, a thousand pities to miss an opportunity of dealing with such a plot of land in a manner which would be beneficial to the cause of science, beneficial to the new Department, and also, we hope, not unworthy of the architectural building s

which stand in that neighbourhood. When the plan comes to full maturity and acquires the assent of Parliament during a succeeding session, you will have there a fine quadrangle, built as it should be built in every part, with a view to what the whole will one day become, and also with this consideration kept closely in mind, namely, that the whole, when complete, shall not conflict with the architectural charm—of a sober quality though it be—of the houses in Merriam Square and Leinster House. Ultimately there will be a quadrangle. The stables disappear, because the college of science takes their place. The trees—rather fine trees—which are now in back gardens will be a beautiful triangle, clumped in the midst of that quadrangle, and through the houses in Upper Merriam Street it will be possible to have arches through which the college of science will be seen on the other side of the quadrangle. It is important, in my opinion, that this Bill should go through. I should think it very imprudent to leave 225,000*l.* hanging in the air on the eve of the consideration of measures which I trust will be of considerable importance to this country. Therefore, what I would be glad to see is a general consensus of opinion that we should consider the site as settled, and that in the matter of the architect we should aim, in the first place, at finding a man who in building the first part of what will be a much bigger plan, will not either build himself or impose upon his successors the necessity of erecting some buildings which would not agree with the fine buildings you have there already. Keeping that before us as the primary object, the secondary object should be the employment of an architect in this city.

#### DEFECTS IN THE 1901 FACTORY AND WORKSHOP ACT.\*

THE Factory and Workshop Act of 1901 contains so many imperfections and serious omissions as to give one the impression that it was hurriedly prepared or unwisely curtailed. It occurred to the writer that a short paper giving prominence to certain defects in this Act, and indicating some of the

\* A paper by Alfred Greenwood, M.D., D.P.H., Medical Officer of Health for Blackburn, read before the Sanitary Congress in Manchester.

requirements which will be desirable in future legislation on this question, would prove of interest to this congress.

The first defect which suggests itself is that the new Act has failed to place the sanitary control of factories under local authorities. The local authority is responsible for the supervision of the sanitary conditions of its workshops and the district generally, and it is a strange anomaly that it does not supervise the sanitary condition of its factories, as nuisances requiring immediate abatement often occur therein.

Under the Factory Act the medical officer of health has no right of entry into a factory, but must wait until the factory inspector forwards his notice, which is often sent first to the clerk to the local authority and then handed to the medical officer of health. This is contradictory to the section under the Public Health Act which gives the local authority, on receipt of a complaint that a nuisance exists on any premises, the power of entry and enforcement of abatement of the said nuisance. This is an unfortunate mingling of Acts of Parliament. In Section 125 there has been an omission of the word "factories," which should have been included with "workshops and workplaces," in reference to the duties of local authorities.

The difficulty in dealing with sanitary defects requiring immediate abatement in factories may be illustrated by the following example:—On June 23 last, owing to the receipt of a complaint from the occupier of a paper mill, one of my inspectors visited these factory premises and found that a scum-pipe in the adjoining street was badly broken about 6 feet from the ground. This soil-pipe received the discharge of fecal closets, and the drain in connection therewith was blocked, with the result that each time the closets were used to excretal flush discharged like a shower-bath over the heads of passers-by and then ran along the street surface to the nearest gully. Inquiries showed that this nuisance had existed for ten days before. All I could do in this case was to inform His Majesty's inspector without delay of the existence of the nuisance. He then sent a complaint of the same nuisance to the town clerk, who referred the matter to me, and the nuisance was crossed off my books as having been abated on July 1. On other occasions I have seen water-closets in factories which through neglect have become very foul, but having regard to the fact that a sanitary authority cannot serve a statutory notice unless the factory inspector first gives the notice in writing, I could only call the attention of the factory inspector to these matters. Numerous other instances might be given, and I believe that these difficulties will increase.

ch that our legislators will soon be compelled to amend their own recent amendments.

In the framing of the 1901 Factory Act many golden opportunities were missed of remedying several defects. The control of the sanitary provisions respecting factories should have been vested in the sanitary authority of the district in which they situate. Such places should be subject to the frequent inspection of sanitary officials, and the sanitary authority should also have the power to secure the imposition of a penalty for nuisances found in factories and workshops. This power is already possessed by H.M. inspector in the case of factories. Secondly, it is also anomalous that the introduction of a small engine into a workshop used in aid of a manufacturing process should transform such workshop into a factory. The sanitation of this building then leaves the hands of the sanitary authority and goes to the factory inspector. Thirdly, in the new Act some duties are referred to the Public Health Act and others to the Factory Act. For example, overcrowding, bad ventilation, blocked drains, filthy premises, in factories are punishable under the Factory Act without notice, but in a workshop the same defects (with the exception of the provision as to the ventilation by fan in certain workshops) are only punishable under the Public Health Act.

Also it is a complication that the Factory and Workshop Act and section 91 of the Public Health Act relating to nuisances may require enforcement for sanitary defects in the place of work. For example, if an occupier employs one or more persons the place of work is a workshop, and defects cleansing and limewashing must be dealt with under the Factory and Workshop Act, but all other sanitary defects in a workshop must be dealt with under section 91 of the Public Health Act. Yet, if the same occupier works there (not living on the premises) the place of work now becomes a workplace, and all sanitary defects must be dealt with under section 91 of the Public Health Act.

In the enforcement of the above provisions, tenement workshops, i.e. those in which rooms are occupied by employees independently, correspond with workshops, and domestic workshops correspond with workplaces. Again, if in addition to the family one or two employees work in a laundry section 91 of the Public Health Act applies for all defects; but if more than two employees, in addition to the family, work there, the Factory and Workshop Act applies for cleansing and limewashing. This appears to involve an overlapping of the two which is very perplexing, and might well have been avoided.

Fourthly, there does not appear to be any provision in the Act compelling an occupier of a factory to admit an official of the sanitary authority for the purpose of ascertaining if the fire-escapes are efficient. Under the present state of the law the factory occupier could refuse admission to the sanitary official.

Also section 14, dealing with certificates showing the provision of satisfactory means of escape in case of fire at factories built after January 1892, and in which more than forty persons are employed, is not of that definite nature which would facilitate its administration. It is not stated whether the owner or occupier is responsible for applying to the sanitary authority for the said certificate, and for receiving it from them in case the arrangements are satisfactory. Also, it is not stated who shall provide satisfactory means of escape in case the arrangements are not satisfactory. The owner is responsible in the case of factories built before 1892. In view of the recent fire in London it is most important that this section should be made more definite and complete; otherwise the section may be valueless.

Fifthly, that portion of the Act relating to bakehouses is truly complicated, and could not be called sound legislation.

In conformity with the remainder of the Act a bakehouse may be a factory or a workshop according as power is or is not used in the process of baking. But a bakehouse may be a "retail" or a "wholesale bakehouse." The term "retail bakehouse" is defined as any bakehouse or place, not being a factory, the bread, biscuits or confectionery baked in which are sold, not wholesale, but by retail, in a shop or place occupied with the bakehouse. The term "wholesale bakehouse" is not defined, and one is left wondering whether it refers to all other bakehouses which are not retail bakehouses, or all bakehouses which are factories, or bakehouses in which the confectionery is sold wholesale. It seems to be an unnecessary complication of the Act that bakehouses should have been differentiated in this way. A definition of the term "wholesale bakehouse" is required, and all bakehouses should be placed under the control of the sanitary authority.

Also, according to the new Act, the abolition for use as bakehouses of all unsuitable underground bakehouses, whether factories or workshops, will rest with the local authority in 1904. There is a lack of consistency in this arrangement, and it seems as if the unpleasant duty of the abolition of unsuitable factory bakehouses will be transferred from H.M. inspector to the official of the sanitary authority. In spite of this,

however, it is to be hoped that all local authorities will take up a firm stand on this point and abolish as many underground bakehouses as possible.

Sixthly, section 11, which requires every steam boiler used for generating steam in a factory or workshop to be examined thoroughly by a competent person once in every fourteen months, and a report of the result of such examination to be entered in the general register of the factory or workshop, would have been improved if power had been given to the factory inspector to compel the enforcement of any recommendations made in this report, and if a penalty recoverable for neglect to comply with this had been included.

Seventhly, another example of confusion in the law is seen in the following. According to section 7 of the Act, sufficient means of ventilation in every room in any factory or workshop shall be provided and maintained, but in section 157 this requirement of means of ventilation in men's workshops has been nullified. It would appear from this that our legislators consider the ventilation of men's workshops of less importance than that of women's workshops.

Eighthly, the Home Secretary has recently drafted an order determining the conditions under which the accommodation in the way of sanitary conveniences provided in a factory or workshop shall be deemed to be sufficient and suitable within the meaning of section 9 of the new Act.

But this does not apply to London or places in which section 22 of the Public Health Acts Amendment Act, 1890, has been adopted, and in which the various councils have the duty of enforcing the provision of suitable and sufficient sanitary conveniences in factories.

Therefore the order can only apply to rural districts, and a few urban districts, and although it may be said that the requirements of this order will probably be used as a standard in districts where it does not apply, it would have been better to have made the order applicable to all factories and workshops.

#### GAS-ENGINES.

A PAPER on "Recent Progress in Gas-Engines" was read by Mr. H. A. Humphrey in the Engineering Section of the British Association at Belfast. The author traced the development of gas-engines, and pointed out the remarkable manner in which the size and power of this type of prime mover has grown,

especially within the last few years, a development which has but few parallels in the history of engineering enterprise. Gas engines of 1,200 and 1,500 h.p. were already working, and others of 2,000 to 4,000 h.p. were being constructed. In the Paris Exhibition of 1900 the 600 h.p. Cockerill gas-engine created much surprise, but now the makers had in hand an engine of 2,500 h.p., and were quite prepared to build one of 5,000 h.p. In this country the first gas-engines above 400 h.p. were started in 1900 and ran with Mond gas, but at the present time the two leading English manufacturers had delivered and had under construction fifty-one gas-engines of between 1,000 and 1,000 h.p. Two makers, Messrs. Crossley and the Premier Company, collectively supplied 17,600 h.p., of which 12,500 h.p. was for driving dynamos. Abroad, apart from all engines of less than 200 h.p., Messrs. Korting Brothers and their licensees had made or had under construction thirty-two gas-engines with a total of 44,500 h.p., averaging 1,390 h.p. per engine. The Société Anonyme John Cockerill and their licensees came next with fifty-nine engines having an aggregate of 32,950 h.p., so that the average size of the engines built by this firm was 558 h.p. The Gasmotoren Fabrik Deutz took the third place with fifty-one engines developing collectively 20,655 h.p.; and were followed by the Deutsche Kraftgas Gesellschaft and their licensees with engines numbering twenty-eight and giving 16,900 h.p. Although America had lagged somewhat behind the Continent in adopting large gas-engines, there was evidence that this state of affairs would not long remain. The Swan Steam Pump Works had only recently started the manufacture of gas-engines, yet they had already put to successful work gas-engines of 1,000 h.p. each, and were now constructing enormous gas-engine gas compressors of 4,000 h.p. each, the first to be running next November and the second by January 1903. The Westinghouse Machine and Manufacturing Company had made gas-engines of 1,500 h.p., and were prepared to build sizes up to 3,000 h.p., either horizontal or vertical. The author described the principal engines mentioned and dealt with improvements in construction, briefly considering types of engines with a view to show upon what lines development was progressing, and to indicate the kind of machine which might be expected to prove the most successful in the future. In conclusion the author pointed out that the future of gas-engines for central station work depended on the ability of gas-engines to drive alternators in parallel, and he gave numerous instances in which this had been accomplished in regular work.

## THE WEEK.

EMILE ZOLA was usually considered only as a novelist, but his Italian extraction was shown in other forms. He was a lover of art, and there is no doubt his influence was of some account in the formation of the realistic school of France. At a very early period of his career he wrote articles on art in which he upheld truth as the foremost of needs. He was, in consequence, opposed to the whole system of official art teaching in which the Académie des Beaux-Arts was the agent. His idol in those days was EDOUARD MANET, and he sympathised with the painter when his nude figure was excluded from the Salon. ZOLA's aim was to produce several novels which should be closely connected, and in which the peculiarities of many types of French people would be revealed. Hence the Roujon-Macquart series arose. Another bond of connection between them was to be found in the operations of hereditary qualities according to the theory of Dr. LUCAS. Mental weakness to some degree was exhibited in the principal characters as if it were inevitable. When in its turn French art had to be treated, CLAUDE, the hero of "L'Œuvre," was presented as an able and honest artist who struggled with many difficulties, but who was doomed to failure, partly because he had inherited the family affliction and was liable to nervous crises, partly because he was living under a Government which endeavoured to corrupt art. The circumstances attending the rejection of MANET's picture were revived and utilised in the novel. In "L'Œuvre" ZOLA showed himself to be most industrious in gathering details, and the life of young painters was displayed with photographic fidelity. There are also allusions to the manner in which French architects obtain their designs, for ZOLA knew that "ghosts" were more of a necessity to them than to painters and sculptors. Of late years French opinion was inimical to ZOLA, because he could not flatter the people or conceal the faults of the Government, but his work never flagged. More noteworthy books were to be expected from his pen, and it is pitiful that so clever and courageous a man should lose his life through a badly-constructed stove. Considering the character of the French apparatus for heating, it is a surprise that many other deaths from suffocation are not recorded every year.

THE Château de Grignan, in Provence, was lately in the market. It has been purchased by the Count and Countess DE CASTELLANE. It is an ancient building, but if it is more often spoken of than the majority of French castles the reason is that its châtelaine was at one time the daughter of Madame DE SÉVIGNÉ, and to whom the famous letters were addressed. An ordinary reader is not much impressed by the Countess DE GRIGNAN from what her enraptured mother says of her. She evidently looked on herself as one of the greatest women in France. But she was in a position which was difficult to fill, and her circumstances may have had much to do with that coldness which, after perusing the letters, we must ascribe to her. Her husband, who married her when she was almost a child, was a lieutenant-general, and he was in debt when he made his third marriage. His château, from what we see of it to-day, was evidently at one time extensive enough to serve as a royal palace. Nobles were induced to consider vast buildings as indispensable, and the French kings and their ministers kept up the delusion in order that the owners might be in financial straits. The Château de Grignan was not only costly to keep up, for it was always crowded with visitors, but it had also gained some notoriety for the excessive gambling that was carried on within it. The host and hostess believed it was a necessary part of hospitality to play for larger stakes than any of the guests. Then the Count had a mania for pictures and furniture, and in his progress through the country was accompanied by as many equestrians as would form a modern circus. It was in vain Madame DE SÉVIGNÉ with her charming good sense endeavoured to remonstrate with the spendthrifts. At times she seemed almost driven into a passion by their extravagance. The end came, and it was necessary for

Madame to give up her residence in Paris and reside in what seemed to her eyes to be a savage country in order to help her luckless daughter and son-in-law.

THE committee of the Melbourne Hospital have generously invited architects throughout the world to compete for a new building, with accommodation for 500 patients. But it is doubtful whether many architects outside the city will be tempted to join in the contest. There are only two prizes offered—one of 250*l.* and one of 100*l.* The medical staff are in favour of a five or six-storey structure. It is, however, uncertain when the building will be erected, for it is admitted that twenty years may elapse before completion is attained. The financial condition of the hospital is not flourishing. Sanguine people believe that the committee possess 30,000*l.*, but at the end of the present year it is expected the expenditure will exceed the income by 4,000*l.*, and besides, there is a large overdraft to be settled. It is objected by some that if plans were now prepared they would be antiquated at the end of fifteen or twenty years, when an attempt might be made to commence operations. In reply, it is said that there is no likelihood of any great revolution in hospital construction, and if there should be it will only relate to internal arrangements. The truth seems to be that the committee are eager to gain credit by appearing as active, and it is supposed that if plans could be exhibited subscriptions might come in. Architects throughout the world are imagined to be willing to aid in such enterprises, regardless of the inconvenience to themselves.

FRENCH artists are generally glad to accept the invitations to compete for works in other countries. But reciprocity is not strong among them, and in consequence it is very rare to find international competitions in France. A project which has just arisen relates to one in which foreign artists can take part, but it is doubtful whether it will ever be finally arranged. An anonymous benefactor, it appears, has left 200,000 francs to the city of Rheims for the erection of a monument. Nothing was said about the work, whether it was to be an allegorical figure, a fountain, a statue of a citizen, or other memorial. The municipality decided to arrange a competition, and to leave the character of the subject to be determined by the artist. A stipulation was made, however, that in designs for fountains it was not to be assumed that an unlimited supply of water was available. It was also resolved to allow foreign artists to compete as well as Frenchmen. The latter clause has excited much indignation in France. It is considered that the authorities have been exceeding their powers, as in a country where so many sculptors lived no necessity existed to go elsewhere for a model. The municipal councillors are declared to be Socialists who are *sans patrie*, and give themselves up to providing for the welfare of humanity at large. Why should not France for once show a little liberality, and give their neighbours the pleasure of matching themselves on equal terms with native artists? No objection was raised in Liverpool when foreign designs for the cathedral were exhibited, although the work to be sought would be far more costly than the Rheims memorial, and bring greater advantage to the winner.

AN effort is now being made in France to bring influence to bear on the War Department in order that the schools and colleges should not be utilised during vacations as barracks by troops. Economy in such cases is prized, while sanitation is undervalued. It is, no doubt, hard to find accommodation for the immense number of reservists who have to be called out for instruction. A large empty building is, therefore, tempting in the eyes of the Staff. On the other hand, it has been ascertained beyond dispute that several epidemics have followed the tenancy of the schools by soldiers. The germs may not in all instances arise in the men, but their presence prevents the cleaning and aeration which should take place in the holidays. In connection with the movement for keeping out the troops, the French doctors are endeavouring to introduce the teaching of the principles of hygiene, which, as every tourist agrees, appear to be unknown not only in schools and colleges, but in hotels and other buildings throughout the country.

PAINTERS' ARCHITECTURE: CLAUDE.

## GILBERT WHITE AS ARCHÆOLOGIST.

PAROCHIALISM is commonly supposed to be inseparable from narrow-mindedness. As SHAKE-SPEARE said, "Home-keeping youth have ever homely wits." In an age like the present, when facilities are given to enable observation to obtain extended views and survey mankind from China to Peru, a mere stay-at-home traveller is considered to be an anomaly. Occupation is, however, to be found alike for all who wish to traverse the earth in order to obtain materials for study, as well as for those who from various causes have to accept the lot of being cabined, cribbed, confined within a limited area. It is impossible to lay down bounds which are sufficient to restrain men's thoughts. "Stone walls do not a prison make, nor iron bars a cage" for the mind. XAVIER DE MAISTRE was able to have an adventurous voyage around his chamber, and ALPHONSE KARR another around his garden, which was not, however, completed as quickly as a friend was able to reach a distant region and return. The accounts of the two travellers will be thought far more entertaining than many large records of journeys to remote parts of the world.

The Rev. GILBERT WHITE, M.A., was therefore not to be pitied, for he could have the whole parish of Selborne "in latitude 51 degs., and near midway between the towns of Alton and Petersfield," as a field for investigation. It was very large and extensive and abutted on twelve parishes. The account of his observations, it is needless to remark, has been recognised not only as one of the most interesting books relating to the natural history of England, but as evidence that a man may become very parochial and yet be a most useful revealer of neglected truths. "What make ye of Parson WHITE in Selborne?" asks CARLYLE. "He had not only no great men to look on, but not even men; merely sparrows and cockchafers: yet has he left us a Biography of these, which under its title, 'Natural History of Selborne,' still remains valuable to us, which has copied a little sentence or two faithfully from the Inspired Volume of Nature, and so is itself not without inspiration." WHITE has had successors who in accepting a circumscribed area for operations, have on that basis formed expansive views of creation. The American THOREAU is perhaps the most noteworthy among them. For most Englishmen "The Natural History of Selborne" has taken rank as a classic, and it is among the books which are likely to be reprinted while their language endures.

It is, however, characteristic of the limitation of popular interest and the strength of popular prejudice that in the majority of editions the natural history is alone presented. The author likewise treated of the "Antiquities of Selborne." His aim was, as he declares, to suggest what a parochial history should be in which natural occurrences as well as antiquities were described. To secure particulars about the history of Selborne he had the archives of Magdalen College, Oxford, explored, and he was undoubtedly at great pains to obtain accurate information about ancient life, although, as we have mentioned, that part of his book seems to possess no value in the eyes of publishers, and is not sought after by the public.

It is well, however, to understand that GILBERT WHITE pursued a different kind of archæology to what is now in fashion. In dealing with natural history his descriptions make no pretension to scientific exactitude. He may refer, for instance, to the colour of a bird, but he rarely attempts to present the details which would satisfy a physiologist. What he always desires to express is the life of the animal, its habits and customs. Thus when he was able to own a tortoise he spoke of the opportunities he would be afforded for observing its mode of living and propensities. In the same spirit, when treating of antiquity, he was regardless of what BURNS called "auld nick-nackets," but wished rather to ascertain facts about the men and women who possessed them. Moving beings are the subjects he prefers, and he is in a great measure indifferent to anything in which he cannot see more or less relation to something that was organised. For example, Wolmer Forest may or may not have existed as a royal domain before the Conquest. If it did not, he says we may suppose it was laid out by some of our earliest Norman kings. A primitive forest planted by different operations was of no account in his eyes. The grandeur of the trees required at least a monarch as director.

A church at Selborne is entered in Domesday Book, of which RADFRADUS was the priest. GILBERT WHITE says:—"How many fabrics have succeeded each other since the days of RADFRADUS, the presbyter, we cannot pretend to say." A modern archæologist would endeavour, if only by the aid of fragments in the existing building, to make out the churches that stood on the site. But the vicar knew little about details or of the characteristics of the various periods of Gothic. Although he believed the pillars, being of the low, squat, thick order, were Saxon, and may have been used in older buildings, yet from "the blunt Gothic arches" he considered the church was of no earlier date than the beginning of the reign of HENRY VII. The windows he described as being of the simple and unadorned sort called lancet. Part of the roof was covered, in WHITE's time, with oak shingles, which he preferred to tiles, for, as he said, "shingles well seasoned and cleft from quartered timber never warp nor let in drifting snow; nor do they shiver with frost; nor are they liable to be blown off, like tiles; but, when well nailed down, last for a long period, as experience has shown us in this place, where those that face to the north are known to have endured, untouched, by undoubted tradition, for more than a century." Selborne Church does not in disposition exactly correspond with the cardinal points. He accounted for the deviation by saying that the workmen were employed during the longest days, and tried to set the chancel to the rising sun. The vicarage, which is near the church, must in pre-Reformation days, he thought, have had the hall open to the roof. When the vicars became family men and wanted more accommodation, then, he believed, they flung a floor across the hall and by partitions divided the space into chambers.

GILBERT WHITE would gladly have recorded any acts of the vicars which were worth notice, for his family was long connected with Selborne. He found there was a WILLIAM WHITE, who held the living until 1594, but all he

can say of him is that he twice entered in the register the funeral of Bishop COWPER, of Winchester, as if that prelate had been buried at Selborne. It is known, however, he was interred at Winchester, near the episcopal throne. Of his namesake, GILBERT WHITE, who was instituted in 1681, more is related. We learn that "At his first coming he ceiled the chancel, and also floored and wainscoted the parlour and hall, which before were paved with stone, and had naked walls; he enlarged the kitchen and brewhouse, and dug a cellar and well; he also built a large new barn in the lower yard, removed the hovels in the front court, which he laid out in walks and borders, and entirely planned the back garden, before a rude field with a stone pit in the midst of it." By his will he gave and bequeathed "the sum of forty pounds to be laid out in the most necessary repairs of the church—that is, in strengthening and securing such parts as seem decaying and dangerous." With this sum two large buttresses were erected to support the east end of the south wall of the church, and the gable-end wall of the west end of the south aisle was new built from the ground. The terms of the will enable us to realise the state of decay into which the church and vicarage had fallen. The vicar also bequeathed 100*l.* to buy land, and the rent was to be utilised in teaching poor children to read and write, say their prayers and catechism, sew and knit. He also left 200*l.* for the repairs of highways in the parish.

Of more archæological importance than the parish church was the Priory of Selborne. It was founded by PETER DE LA ROCHE or DE RUPIBUS, a foreigner, who was a favourite of King JOHN, by whom he was appointed Bishop of Winchester, Lord Chief Justiciary, and he held other important offices. During the minority of HENRY III. he was Protector of the kingdom. He was a munificent prelate, and built a church and constructed fortifications at Jaffa in Palestine, besides creating many religious establishments in this country. A year after his return to England from the Holy Land he undertook the building and endowment of Selborne Priory. It was intended to provide for Canons Regular of the Order of St. AUGUSTINE. The prior appears to have been vested with some of the authority of a bishop in the district, for Sir ADAM GURDON, who was a soldier of fortune living in the locality, obtained permission from him to build an oratory in his manor-house, then a rare privilege, while some years after there was a second case. GURDON was a benefactor to the priory, and he presented a piece of ground, known in the village as "La Playstow," as a playground.

In the next century the priory was officially visited by WILLIAM OF WYKEHAM, and the records show that the bishop, who was so devoted to architecture, was a particularly severe inquisitor, and stern in punishing any departure from monastic rule. He found several of the canons ignorant and illiterate, owning manors and farms, which they visited without permission; that they were hunters and sportsmen, kept hounds and attended various matches. Meanwhile the priory walls and enclosures and the houses and tenements belonging to the institution were allowed to fall into a dilapidated condition. All defects of masonry were ordered to be repaired within six months under pain of suspension. Foppish ornaments were condemned, including garments edged with costly furs, fringed gloves and silken girdles. The altar-plate, clothes and vestments were carelessly kept. Some of the relics, plate, vestments and books had been pawned. All such property had by his command to be immediately redeemed. WILLIAM OF WYKEHAM on another occasion was more merciful, for he discharged the whole of the debts of the canons, and a few years before he died he bequeathed 100 marks to the priory. Bishop BEAUFORT, of Winchester, was a less sincere friend, for the Pope had to interfere to prevent an important part of the property being alienated for the support of the cathedral. In 1462 it was necessary to issue a power of sequestration against the priory on account of the dilapidations, which threatened ruin to the buildings. The document was respected, and repairs to a considerable amount were carried out. There were evidently dissensions amongst the canons which the bishops were unable to overcome. In 1486 a Bull was received from the Pope suppressing the priory, after it had been in existence for 254 years.

WAYNEFLETE, Bishop of Winchester, founded Magdalen

College, Oxford, about 1449. As the property of the college was insufficient to meet the expenses, the estates belonging to the deserted priory were assigned to it. But the authorities of the college were not disposed to act the part of good tenants. What followed has been described by GILBERT WHITE, and it suggests that in the years immediately preceding the Reformation and the seizure of ecclesiastical property by HENRY VIII., ecclesiastical buildings were allowed to become ruinous from other causes. WHITE says:—

No sooner did the priory (perhaps much out of repair at the time) become an appendage to the college, but it must at once have tended to swift decay. Magdalen College wanted now only two chambers for the chantry priest and his assistant, and therefore had no occasion for the hall, dormitory and other spacious apartments belonging to so large a foundation. The roofs neglected, would soon become the possession of daws and owls, and being rotted and decayed by the weather would fall in upon the floors, so that all parts must have hastened to speedy dilapidation and a scene of broken ruins. Three full centuries have now passed since the Dissolution—a series of years that would craze the stoutest edifices. But besides the slow hand of time many circumstances have contributed to level this venerable structure with the ground, of which nothing now remains but one piece of wall of about 10 feet long and as many feet high, which probably was part of an outhouse. As early as the latter end of the reign of Henry VII. we find that a farmhouse and two barns were built to the south of the priory, and undoubtedly out of its materials. Avarice again has much contributed to the overthrow of this stately pile, as long as the tenants could make money of its stones or timbers. Wantonness no doubt has had a share in the demolition, for boys love to destroy what men venerate and admire.

It is remarkable that WHITE should mention that "a large Doric capital worked in good taste" had been brought to light whilst digging among the foundations for materials to mend the highways. But as he conjectures that a base, also discovered, belonged to the column, we suppose capital and base formed parts of a plain moulded Gothic capital.

The Knights Templars owned much land at Selborne, and had a preceptory at Sudington within a mile of the village, but there are no remains of the building. The Templars and the priors lived on good terms.

GILBERT WHITE's devotion to Selborne was characteristic of his nature. When he was twenty-four he was elected a Fellow of Oriel, and if he were ambitious he could have obtained promotion in the Church. He rejected all the college livings which were offered. The vicarage of Selborne was the goal he kept before him, and once he was back again in his native village, with which his family were long connected, he had no wish to go beyond it. After his death there was a desire to have a portrait of him placed among the worthies of Oriel, but not one sketch of him could be met with. Every reader of his book must trust to imagination for the author's appearance. No naturalist has been more genial in his descriptions. He never poses as a philosopher, and yet he gives continual proof of his ability to see good in everything. As an archæologist there was not much to be met with in Selborne for his study, and he could not be persuaded to seek elsewhere for the knowledge which could have supplemented his investigations in the village. He may have thought that to do so would suggest incompleteness in Selborne. Everything in it was to him enjoyable and worthy of praise, as when he says that the freestone of the place makes elegant fronts for buildings, equal in colour and grain to Bath stone, and superior in never scaling; that it was closer and finer than Portland. Then there comes the forest stone which had also many excellent qualities, and which by way of ornamentation the masons used to chip into small fragments about the size of the head of a large nail, and stick the pieces into the mortar joints of the freestone walls. "This embellishment," writes the gratified vicar, "carries an odd appearance, and has occasioned strangers sometimes to ask us pleasantly "whether we fastened our walls together with tenpenny nails."

A British exhibition of arts and crafts was opened at Budapest on Sunday. It is under the direction of Mr. Lyon Thomson and is likely to be successful.

## INTERNATIONAL ENGINEERING CONGRESS.\*

THERE is an essential difference between the congresses of engineers and those of architects. The reason is that in the latter the personal element is dominant. No matter whether the congresses are held in America, France, or England, if the essays which relate to architects, their education, fees, competitions, &c., were prohibited, there would be little left to engage attention. Civil and mechanical engineers when they meet have so much to talk about in the way of modern inventions or arrangements, no time seems to be left for the consideration of questions which affect themselves except in a strictly professional sense. The report of the engineering congress which took place in Glasgow last year exhibits the peculiarity to an extraordinary extent. Even the speeches at the banquet possessed a business character. The conference has been only lately established, but there is no jealousy about its existence. The principal engineering societies have aided in its promotion. Sir WILLIAM PREECE announced the congress in his introductory address at the Institution of Civil Engineers; his successor, Sir DOUGLAS FOX, acted as chairman of the London committee. Mr. MANSERGH, a third president, undertook to preside at the meetings. In various other ways assistance has been given, and, in consequence, the Glasgow gathering was an undoubted success.

The sections which have been formed represent railways, waterways and maritime works, mechanical engineering, naval architecture and marine engineering, iron and steel, mining, municipal engineering, gas and electrical engineering. The diversity of subjects which belong to the engineer's profession is so remarkable that Mr. MANSERGH, the president, was justified in wishing that the vocation should be called "ingeniering" rather than "engineering." At present "engine" has gained a significance which was not attached to it, and it would be better to suggest by the title "ingenious," "ingenuity," &c. The American definition which describes the engineer as a man who can do well for one dollar things that anybody could do somehow for double the money, comes near the truth. For, according to Mr. MANSERGH, "all other things being equal—adaptability, soundness, efficiency—the engineering work which costs the least money is the best." In saying this, the President had an opportunity to gird at professors, and he recounted the legend of one who was shocked at the thought of steam-engines being made for money, to sell like cakes. On the subject of Great Britain's industrial position, Mr. MANSERGH expressed himself in a way which should be remembered:—"Brains are no peculiar possession of our nationality. The cosmic forces are the same everywhere. Economic conditions tend to wear down to a uniform level. Science knows no frontiers. The engineer is the truest free-trader. He goes whithersoever he is wanted and finds most to do. Will he in future flourish best in Britain or abroad?" The answer which many people would now give would be that future success depends entirely on the introduction of new systems of technical education. Mr. MANSERGH says there cannot be too much of it; but he adds:—"Nevertheless, I hold liberty to be more precious than learning. The fullest freedom for the exercise of the inborn spirit of initiative, enterprise and adventure is the next essential to the occurrence of this spirit in the individual members of a race, for enabling the whole to make headway in the universal struggle for life and for a leading position." He also points out that with the best of intentions Parliament can pass laws which are not advantageous to engineering. The effect of the Electric Lighting Acts has been to create a great many petty divisions of work. Years elapsed before an English engineer could arrange an electrical power contract amounting to 100,000*l.* The result is we have lost our chance, and shall probably have to adopt other people's plant, instead of striking out our own line like the less governed engineers who were connected with railways and shipbuilding.

Sir GUILFORD MOLESWORTH gave an account of the Uganda Railway. The first European who had penetrated the region was Mr. JOSEPH THOMSON, who made a hurried visit in 1888. It was therefore very difficult to decide about the laying out of the line. When the work was commenced almost all the labour had to be derived from India. We are told that the construction involved an organisation equivalent to the maintenance of an army of 15,000 men in a practically waterless country, devoid of resources and of all means of animal or of wheeled transport, with a base of operations to which everything had to be imported from a distant country. A condensing plant and a corn mill were indispensable adjuncts. The route was difficult. The ruling gradients sometimes were 1 in 30, and in one place the gradient was 1 in 2. Wild beasts and insects whose sting was fatal abound throughout the first 250 miles; 28 Indian labourers fell a prey to lions, and a police force of 200, as well as a complete hospital staff, had to be maintained.

The military railways in the Soudan were treated by Major MACAULEY. Steel sleepers are necessary on some sections owing to the prevalence of the destructive white ant. Sand also causes an abnormal wear and tear of materials. One length of 99 miles is liable to be washed away, but the risk is accepted rather than incur the expense of a safer line. There are two fast trains weekly to Khartoum. Mr. JAMES BARTON again brought up his project for a tunnel between Scotland and Ireland. The cost is estimated at 10 millions sterling, but finance is the chief difficulty. Until a heading has been run from the Irish side past the junction between the sandstone and silurian, no contractor is willing to undertake the tunnel at a fixed sum; to do this, however, would probably not cost more than half a million, and a heading through the whole 34 miles is put down at 2½ millions. The political effects of such a work are not easy to judge, but there is no question that it would aid in overcoming that feeling of isolation which fosters agitation in Ireland.

A description of the Dortmund and Ems Canal was furnished by Herr HERMANN. It is 168 miles in length, and the arrangement of locks and lifts is very ingenious; one lift entailed an expense of 130,000*l.* The total cost of the canal was about four millions sterling. The lifts are worked by electricity, and electric towage will shortly be introduced. A paper on the plant used on the Chicago Drainage Canal works gives an account of some of the "conveyors" which are employed for delivering the excavated material to the spoil area. One removes 968 cubic yards in ten hours; another takes 400 cubic yards a day. It is said that "this gigantic work is bound to exercise a wonderful influence as an educator, and embolden men to undertake enterprises more vast than were considered practicable before its success had been demonstrated. The great array of mechanism brought into being for its construction, which earned vastly more than it cost to produce, was, most of it, without a sphere of usefulness after the work was completed, and was dismantled and sold for the value of the raw material." Papers were read on irrigation in the Nile Valley; on a waterway between the White Sea and the Baltic Sea; on the improvement of the Lower Mississippi; on the Danube improvements; the Clyde and its estuary; the improvement of the Bilbao River, and other subjects, which show how much importance is now being attached to canals and rivers. The Clyde seems to have had a remarkable influence on the growth of Glasgow. When the improvement of the river was commenced there were 40,000 inhabitants; the city has now 760,406. The revenue has expanded from 147*l.* to 441,419*l.*; the accommodation from 2½ acres to 206 acres of water and from 262 yards of quay to 15,115 yards.

Several interesting papers were offered in the section of iron and steel. In three of them the history of the production of the materials in Scotland is narrated. A report was presented advocating the unification of terms as far as possible in metallography and geology. The Iron and Steel Institute is collaborating with the German engineers in the compilation of a great international technical lexicon. It was recommended that wherever possible terms familiar to the mineralogist and geologist should be used in describing the structures of metals and alloys, and that the coining of new words should be deprecated.

\* *International Engineering Congress (Glasgow), 1901.* Report of the Proceedings and abstracts of the papers read. With a preface by Robert Caird, LL.D., chairman of the Executive Committee. Edited by the general secretary, J. D. Cormack. (Glasgow: William Asher.)

In the section of mining Mr. G. L. ALLEN dealt with the modern methods of brickmaking. He divided them into plastic, dry-press and semi-plastic, and informed the meeting that the manufacturer who wished to found a successful business must satisfy himself at the beginning as to which method was most suitable for his material. The old-fashioned open-air drying is becoming a thing of the past, and is superseded by drying-floors and tunnel-driers. The older type of kilns is also being supplanted by the continuous kiln. The following information is given concerning dry-press bricks:—

Up to the present time little has been done in this country in the making of dry-press bricks, though in other countries, particularly in the United States, the best quality of facing bricks is made by this system. Where it has been tried in Britain it has not been altogether successful, but this result is due to a want of knowledge of the material best suited to this method and ignorance of the machinery best fitted for it. Briefly stated, the method is as follows:—The clay is first thoroughly dried, preferably by being left for some time under a shed with a hot floor. It is then thoroughly ground in perforated mills, and being next elevated to the top of the building, it is then sifted, the finer particles of clay being delivered by rhones down through a hopper to the press, while the coarser material is returned to the mill. The fine clay is next delivered through a charger into moulds, where by plungers with increasing degrees of force it is formed into completed bricks. It is to be noted that different qualities of clay require different degrees of pressure. These bricks require more careful steaming and harder burning than the bricks made by the plastic method.

The paper read by the President of the Congress on the Birmingham Waterworks, of which he is engineer, suggested, among other things, the advantages of comfortably housing navvies. A temporary village for about 1,200 people has been raised, with the result that good steady men are constantly kept, which is a gain in so extensive an undertaking. Besides the huts there are schools, a recreation-hall, water and sewage works, baths and washhouses, a general hospital and one for infectious diseases, and a dosshouse which serves for tramps while in quarantine. The whole is under a village superintendent, who is also the bandmaster. The Corporation alone sell beer, and the profit is spent for the benefit of the men in various sports and entertainments.

Many other papers will repay attention. In one delivered in the electrical section it was stated that Lord KELVIN holds thirty-eight patents for electric instruments, of which particulars were given. The published proceedings of the congress may be said to typify the latest and most important inventions and discoveries in the wide field of engineering. It is true that in the majority of cases no more than abstracts of the papers are printed. But they will be found sufficient for the majority of students of practical science. In time the volumes must have unusual interest, and they will enable inquirers to ascertain where information on special subjects can be obtained, and in that way will facilitate researches.

### THE PARADOX OF THE PANTHEON.

THE Romans were the first people to realise the artistic value and develop the architectural possibilities of the groined vault and dome. By their means they obtained effects of unencumbered spaciousness impossible with columns and piers. Greek buildings remain to our day only as roofless ruins. The stupendous monuments of Egypt, rivalling those of Rome in magnitude, are chiefly open courts and colonnades with hypostyle halls, which, though roofed with stone, are encumbered by columns. In the Great Hall at Karnak the broadest aisle is less than 20 feet wide in the clear and not over 80 feet high. In contrast with these dimensions are those of the Baths of Diocletian at Rome, which have an unencumbered floor space of 340 by 87 feet, with a groined vault 90 feet high. The constructive methods by which the Romans accomplished the erection of these great buildings have been investigated by many architects, and are the subject of several valuable books. A systematic study and examination of Roman vaulting has never been undertaken, however, and in the most perfectly preserved and frequently visited of all Poman monuments, the Pantheon, the extraordinary contradiction between the construction and decoration of the magnificent dome,

though known for 150 years, has hardly been discussed. In 1894 Professor A. D. F. Hamlin, of Columbia University, observed certain facts which suggested a surprising explanation of this paradox, and after waiting in vain for some years for a solution from some other source, has discussed the subject in a series of papers in the *School of Mines Quarterly*, from which the following notes, says the *Engineering Record*, have been abridged with his permission. As a study in ancient Roman vault construction, apart from the Pantheon problem, the papers also merit the attention of all interested in the engineering and architectural methods of bygone days.

The true Roman system of construction is particularly interesting at the present time because it was based on the use of concrete. The architecture of the Egyptians and the Greeks was one of stone, and the construction of their great edifices was a tedious labour. When Rome, enriched by the spoils of worldwide conquests, began to build on a grand scale, the slow processes of stone construction were out of the question. She had enormous resources as respects rude labour, and the practical Roman builders accordingly devised a system of construction utilising this unskilled labour to the utmost, employing the relatively limited artistic resources of the empire so as to make a minimum of original design serve for a maximum of buildings. Hence the greater part of the walls, piers and vaults were concrete, and brick and stone were used only for facings.

The builders were economical in many respects. To support the enormous weight of the heavy concrete vaulting while it was setting would have involved a massiveness of timber construction for centerings which was deemed extravagant, and two other methods were adopted to accomplish the same end. Sometimes, over a very light wooden frame covered with slats a couple of feet apart, there was built a thin vault of large flat tiles laid in strong cement. These were covered in turn with smaller tiles breaking joints with the layer below. This made a strong elastic shell, which when loaded up to the haunches with concrete, was quite sufficient to carry the load of the concrete afterwards placed on the upper portion to complete the vault. The second method of construction, used in the larger vaults, was more complex. Cellular ribs of brick and tile were first built on light centres. Other centres were then fixed between the ribs, and the intervening space was filled with concrete. As these fillings, starting from the spring and growing a foot or two daily, hardened, they formed monolithic lintels between the ribs, bracing them against lateral overturning, and taking upon themselves a part of the weight of the next portion of the filling.

It is noteworthy that these admirable building methods eventually degenerated into matters of unthinking routine, and there are ribbed vaults where the ribs could have served no useful purpose. Even the Pantheon dating from the early part of the second century is full of solecisms. Lanciani declares that the beautifully executed discharging arches which are so noticeable in the upper part of the exterior brick facing are only one brick deep, and serve no constructive purpose. In the dome of this building the constructive ingenuity of the Romans appears highly developed and yet associated with the most extraordinary disregard alike of that economy of means and labour which characterises many phases of Roman building, and of the logical connection which in most great architectural works exists between the structural framework and the decorative dress. In the dome of the Pantheon these are not merely independent but are absolutely contradictory.

The Pantheon was built by Hadrian between 117 and 138 on the site of an earlier temple constructed by Agrippa. The portico is a reconstruction by Septimius Severus and Caracalla with materials from an older structure. The building is a circular edifice 142 feet in diameter, internally covered by a hemispherical dome 140 feet high, springing from the circular wall. This wall is 20 feet thick, but its seeming massiveness is reduced one-half by seven niches, n, figure 1, opening inwards, and alternately rectangular and semicircular in plan, an eighth opening forming the great doorway, and eight smaller semicircular chambers opening outward only through small windows. The eight large niches are capped by arches and half-domes. The wall appears to have been constructed in the usual way with facing of broad flat bricks and a filling of pozzolana concrete. The dome is sprung low enough to be inscribed within the square of 142 feet. The 28-foot oculus or eye at the summit not only lights the interior in the most beautiful manner imaginable, but relieves the dome of a great weight at its weakest point, while the carrying up of the exterior drum to one-third the height of the dome, and the series of external steps encircling the dome above it, provide for the loading of the haunches of the vault in the most satisfactory way.

Very effective, also, and admirably simple is the interior panelling of the dome with 140 plain rectangular coffers, each showing four sinkages except in the panels of the upper or fifth

tier, which have but three. The lower rails in each panel are wider than the upper ones in order to render them visible to a spectator on the floor of the temple. The paradox of the Pantheon is to be found in this interior panelled face of the vault.

The use of panels as a ceiling decoration lent itself readily to Roman methods of vaulting with brick ribs, which could be arranged to form the vertical members of the framework of the panels, while the horizontal members or rails could likewise be built of brick, forming a rectangular network of bricks sufficiently rigid when set to carry of itself the concrete filling and backing of the vault. But as a matter of fact few large vaults remain which show this system of construction. The great vault of Diocletian's Baths, now the church of S. Maria degli Angeli, is quite smooth and plain internally. Others, like the vaults of the side chambers of the basilica of Maxentius and Constantine, are adorned with polygonal panels, large octagons and small squares or other like combinations, which contradict any practical system of structural ribs. The one complete and monumental example of this kind of vault decoration is the Pantheon, and here, if anywhere, it would seem to be the natural thing to allow the ribbing of the vault panels to dictate the design of the structural framework of the dome. The interior aspect of the dome would naturally suggest a system of vertical ribs converging to the oculus, and a series of horizontal arches between them, framing the panels and stiffening the whole skeleton. But this is not at all the way the dome was constructed, and unfortunately it is impossible at present to say clearly how it was built.

The discordance between the lines of the panelling and the structural skeleton of the dome was first observed during repairs executed between 1743 and 1756, when an architect named Piranesi was enabled to study the construction. His drawings, figure 2, stated to be from measurements, show a framework of eight discharging arches over the eight niches or chapels, supporting eight massive ribs springing from their crowns and braced against disruption under this heavy load by a second tier of arches sprung from the haunches. This system of arches and ribs, harmonising with the general plan of the wall below, was generally accepted by students of Roman art until recently. The fact that its lines cut across those of the panels and that an eight-fold system is fundamentally inharmonious with one of twenty-eight parts, was of course patent to the most careless observer. But this did not discredit Piranesi's presentation of the structural framework of the dome, because this, if inharmonious with the panelling, was perfectly consistent with the eight-part design of the whole interior, and the panelling was generally considered as a decorative appliqué of ribs in relief, presumably in concrete or stucco, on the inner surface of the completed vault, as shown in Piranesi's cross-sections.

This explanation of the construction of the dome was questioned by Viollet-le-Duc in his famous "Dictionnaire." He suggested, figure 3, a preliminary skeleton of twenty-eight ribs and four series of horizontal arches, all of brick, light enough to be carried by trussed centerings; these formed the panelled design of the inner surface of the dome and served as a permanent centering for the construction of a more massive outer shell of arches and ribs after a modification of Piranesi's system. But this was merely a clever speculation of the French architect and has no basis in observed facts.

Professor Josef Durm, in his "Baukunst der Römer," discredits Piranesi's scheme by claiming that the latter could have discovered the ribs and arches only by cutting through the exterior cornice and steps around the base and haunches of the dome, and that, as there is no evidence of this, "one may be led to the conclusion that Piranesi was entertaining his readers with a figment of his own imagination." Durm accepts, however, the theory of two shells and two superposed frameworks, but he suggests that there are fourteen and not eight ribs, and that they are sprung directly from the wall and not from discharging arches. He seems to have overlooked the fact that in harmonising the framing and panelling he has thrown the framing and the walls supporting it out of accord. Moreover, it hardly seems likely that Piranesi would entirely invent his system at a time when the evidences of his fraud would be so entirely patent to other observers.

From a study of these data and theories, which he gives more completely in his papers, Professor Hamlin reached the conclusion that Viollet-le-Duc's assumption of two shells was reasonable, although without insisting on the order in which they were built. It was possible that the outer or Piranesi shell was built first and the panelled framework laid up afterwards, on the removal of the great centerings for the outer shell, by means of movable centerings hung from the outer framework. Each zone of the panelling would be self-sustaining as soon as completed. If thus constructed as an afterthought, perhaps when Septimius Severus rebuilt the portion, its discordance with the divisions of the dome framework is easier to understand. It was with this theory in mind that Professor Hamlin examined the dome in 1894. Two years earlier,

M. Chédanne had removed the stucco from three panels of the lower row in the dome and from several small areas near these. These bare spots were examined with an opera glass, as there was no scaffolding from which a close examination could be made at the time, and it was clearly seen that the whole structure was brick, ribs and filling alike. But the singular fact became apparent that it was not composed of structural ribs laid up as such according to the theories of Viollet-le-Duc and Durm, but the panelling was formed in the substance of the massive dome of brick, with discharging arches cutting at haphazard across the panels, as shown in figure 4. The theory of a double shell, as well as that of panelling in concrete added as an afterthought, was thus disposed of. The dome was a single massive vault of solid brick, an unusual construction in Rome; the panelling was formed in the brickwork itself and this brickwork was laid up in a series of discharging arches, for a part of its height at least. These were plainly seen to have been planned with reference to the chapels or niches below, and so far, at least, Piranesi was proved to have been correct.

But these facts merely shifted the puzzle, they did not solve it. The inherent contradiction between the twenty-eight panel ribs and the eight-fold design of the rotunda was not explained, it was accentuated. The 140 panels were a part of the dome itself. The only explanation of the contradiction to the satisfaction of Professor Hamlin is that the panelling was a decorative embellishment of the dome, which was originally intended to present a smooth internal surface, and that the panels were hewn in the solid brickwork after the completion of the vault. Professor Hamlin acknowledges that such a procedure is contrary to the assumed method of Roman construction; but the alternative solution, that the panels were formed during the laying up of the various discharging arches, assumes the use of moulds and of complicated special shapes of brick far exceeding the capabilities of Roman masons at the time this work was done. In Professor Hamlin's papers he explains in detail the intricacy of the masonwork necessary in laying up the relieving arches and their filling over the huge forms for the panels.

If the dome is supposed to have been built first, with or without a skeleton of arches and structural ribs extending through its whole thickness, and without regard to interior decoration, it becomes clear that this could be done with relatively light and simple trussed centerings. Chédanne has shown from his examination of the brickwork that the eight discharging arches are built like vertical arches, although with the inner faces shaped to the curve of the dome. If this is also true of a second row of arches, as in the Piranesi theory, all the lower part of the dome could have been built up nearly to half its height without centering. As a matter of fact, Piranesi's sections show all the masonry of the dome up to the level of the fourth row of panels laid up in horizontal courses, and with this Chédanne's observations agree. From that level it was possible to erect the eight massive ribs and the oculus at the top on skeleton centerings, spanning the opening with trusses either resting on the completed zone or supported from the floor of the rotunda. In figure 5 Professor Hamlin sketches a part of the dome carried up in this manner; he does not claim that this was done, but merely suggests that such a procedure was possible and comparatively simple if the builders did not concern themselves about the interior panelling. The dome being completed and the centerings removed, wholly or in part, the hewing of the panels subsequently would be a simple matter without endangering the stability of the vault. The work would be simple, within the ability of labourers of little or no skill, and remarkable only for its quantity and not its difficulty. That the panels were formed in this manner is the more credible because it allows the supposition that the interior decoration was designed quite independently of the construction.

But two objections have been advanced against the validity of this theory. Chédanne has reported that the surface of the bricks does not indicate cutting. But Professor Hamlin finds it easier to believe Chédanne mistaken in his observations on this point than to suppose the arches could have been built into the moulds without cutting or breaking the bricks; in most cases, he states, it would have been an absolute impossibility. On the other hand, the rough hewing of the panels, to be finished afterwards in stucco, might in many places have exposed such a serrated surface as Chédanne appears to have noticed, where the ends of brick came close to the hewing line.

The other argument is the fact that in the centre of each panel there is a bronze anchor set in the brickwork to hold a bronze rosette or other ornament. It is not impossible that these were set in the brickwork after its completion, as such an operation is common enough in modern work. But even were this not so, it would simply prove that the panelling had been conceived and provided for when the dome was first built, without at all proving that the panels were actually shaped in the extremely difficult manner suggested by M. Chédanne.

Evidence of the most valuable nature as to the merits of

these various explanations of the paradox of the Pantheon could be drawn from the appearance of other buildings of like character, but the present state of knowledge of the details of the vaults from the time of Hadrian to that of Constantine is inconclusive. Only by a critical examination of these structures can the true history and chronology of panelled vault decoration be worked out. Professor Hamlin gives illustrations of a few examples of such panelled vaulting in which the work is considered to support his theories. The summary of his investigations and studies he states in the following words:—

"To sum up the conclusions which appear most rational, taking into account the present unsatisfactory character of the evidence at hand, or at least its lack of final conclusiveness, it would seem probable that the dome of the Pantheon as constructed in the time of Hadrian was internally a smooth vault, as its upper part always remained, and as many great vaults often were, *e.g.* the great vault of the Trepidarium of Diocletian's Baths, now the nave of S. Maria degli Angeli. At some date subsequent to its completion, and very probably in the time of Septimius Severus, who rebuilt the great portico of the temple, or of Caracalla, it would appear that the emperor, desiring to

was thus completed the whole was once more stuccoed, mouldings were run in the stucco of the edges of the 140 panels, the central rosettes and adornments of gilded bronze were added and the work was completed.

"The final proof or disproof of this theory must rest upon further and more minute investigation than has yet been possible, both of the Pantheon itself—to the unravelling of whose complicated history M. Chédanne has made so important a contribution—and of other vaulted structures of the Roman Imperial epoch. The Piranesi system must be finally vindicated or disproved by a more complete examination of the dome than has so far been undertaken. The brickwork of this and other monuments must be examined for technical evidence as to its having been hewn or laid up to a mould. It is to be hoped that the labours of the Italian Government, whose Direzione Generale delle Antichità watches with such zealous and intelligent guardianship over its priceless archaeological possessions, and the investigations of archaeologists and students, both Italian and foreign, to whom the Government shows such considerate hospitality, may at no distant date finally and authoritatively elucidate the paradox of the Pantheon."

Fig. 5

embellish the dome and to replace its faded or ineffective stucco decoration with something more permanent and dignified, caused the existing panels to be hewn as a part of his work of general restoration and improvement. Owing to the difficulty and danger of working from overhead in the nearly flat central field of the dome, this work was confined to the lower three-quarters of its surface. It was a work easily executed when once the scaffolding was erected. No indications of the internal structure, discharging arches or ribs appeared upon the stuccoed surface of the dome. The designer concerned himself, therefore, with only two problems—to secure an adequate scale in his work and to arrange so that the panels should centre over the four axial niches of the building. The resultant of these two considerations was the adoption of a scale or spacing giving six panels intermediate between those centred on the axes of the building. The panels were marked out on the plastered surface and the cutting begun, the hewing away of portions of the discharging arches of the dome being a relatively unimportant incident of the work. The bevelling of the lower reveal of each sinkage of the panels was a very simple detail of the cutting, although it would have caused infinite labour and trouble to execute upon a mould as suggested by M. Chédanne. When the hewing

## ST. THOMAS, SALISBURY.

THE fifteenth-century church of St. Thomas of Canterbury, Salisbury, is in need of external repair, and a committee has been formed to raise 3,000£ for the purpose. The church, which is seated for about 1,000 people, is remarkable for its lofty choir and nave, with clerestory throughout. It has an exquisitely-panelled ceiling and fine mural paintings, while the tower is held by some to be of earlier date than the rest of the fabric. The committee have placed the work in the hands of Mr. T. G. Jackson, R.A., who has reported that the nave arcades have settled westward, and that all the columns have a slight inclination in the same direction. He proposes to remedy this by adding substantial buttresses to the west end. The tower, he finds, inclines so much to the south that the point of the spire, which is 95 feet from the ground, has moved about 2 feet 3 inches from the perpendicular axis. The roof of the south chancel aisle is in a bad state and will require reconstruction. It will also be necessary to take off and recast much of the lead on the roof. The total cost of the work he mentions would be 5,000£, and the committee have decided to proceed with the absolutely essential parts of it at a cost of 3,000£. They have already received gifts or promises amounting to over 1,000£.

## NOTES AND COMMENTS.

A RELIC of the old system of providing Paris with water is about to be removed: this is the "Pompe à feu de Chaillot," which stood near the Pont de l'Alma. In the reign of LOUIS XV. the principal sources of supply were pumps at the Pont-Neuf and the Pont Notre-Dame. In 1781 the Brothers PERIER projected an additional supply, and it was claimed that the water of the Seine could be obtained in unlimited quantities, that the luxury of baths might be enjoyed without hindrance, that fires could be extinguished and the streets watered in summer. A company was formed to carry out the arrangements, and works were constructed at Chaillot. The water was introduced into a reservoir from the Seine, and the part of the river selected was supposed to be the only one where there was an affluence of water. It was also contemplated to have other reservoirs in positions which would dominate the city. At first the enterprise was a success, at least, for the shareholders, as the price of the shares rose from 1,200 livres to 4,000. But the discontent which prevailed about the period of the Revolution was not favourable to the project. MIRABEAU found it served his purpose to oppose the PERIERS. The value of the shares fell as quickly as they had been elevated, and the unfortunate brothers were ruined and died in great poverty. Afterwards the municipal authorities of Paris undertook the scheme. Since a new supply was utilised the reservoirs have been useless, for they are not even required to fill the lakes in the Bois de Boulogne. It has therefore been resolved to remove all that remains of the works and to sell the ground, which will be, no doubt, valuable for building.

THE Camberwell School of Arts and Crafts has been reopened for a new session of usefulness. An extension of the buildings has been arranged for in order to accommodate classes in brickwork, carpentry, plumbing, stained glass, &c. The building is a memorial of Lord LEIGHTON, and the instruction is especially adapted for those engaged in building and the subsidiary arts. The school is to supplement apprenticeship rather than supplant it. The classes of architectural design and building construction are directed by Mr. A. W. JARVIS, architect. There are also classes for wood-carving, stone-carving, masonry, plasterwork, house-painting and decorating.

THE excavations at Corinth have produced interesting evidence of the former attractiveness of the city. The principal fountain was protected by a structure which was surmounted by a figure of POSEIDON with dolphins. The Romans recognised the value of the water, and surrounded it with a balustrade of coloured marbles. The large triumphal arch was likely to have been erected during the Roman dominion. Parts of two colossal figures of Phrygians have been unearthed. Two heads of women of more than life size were also found. HELIOS, or the sun god, was revered by the Corinthians, and a bust in relief shows the extended rays surrounding the head, which are not uncommon in later Greek examples. The credit for the discoveries must be ascribed to the American Archaeological Institute.

A FEW years ago there was an outcry against the rebuilding of the tower of Liskeard Church, which was considered to be dangerous by the parishioners. The work will be completed in a few weeks, and the total cost, including the hanging of the bells and the placing of stained glass in the window, amounts to 6,200*l.*, towards which 4,100*l.* was subscribed. It was alleged that the tower being Norman, a new tower in a later style would be an anomaly. It was incorrect to describe the tower as Norman. In the course of the operations, embedded in the rubble-built walls of the old tower were found the "dog-tooth" stones which formed the principal arch or entrance to the original Norman tower. These stones were thrown into the old walls at the time of rebuilding or "restoration" for filling purposes, and not treated as of any value. They have all been carefully re-formed into an interior arch on the north side of the tower, and represent a most interesting feature of early work. All the other original worked stones discovered in the old walls—evidently cast there in the same careless manner—have

been preserved and reset in position, as well as the grotesque figures or gargoyles supporting the small Norman arches near the parapet. There is now a safe tower which retains all the valuable parts contained in the old tower, and in complete accord with the grand old parish church. The vicar and churchwardens are therefore justified in appealing to lovers of ecclesiastical architecture for aid towards providing the sum of 2,100*l.* which is still required to pay the expenses.

## ILLUSTRATIONS.

## PREMIATED DESIGNS FOR PROPOSED NEW MUNICIPAL OFFICES, CREWE.

By Mr. H. T. HARE, F.R.I.B.A., Mr. A. E. DIXON, A.R.I.B.A., Messrs. BANISTER FLETCHER & SONS, Messrs. E. G. RODWAY and C. F. W. DENING.

THE following is the report of the assessors, Messrs. WOODHOUSE & WILLOUGHBY, on the forty-four sets of competitive designs submitted in the competition for the Crewe Municipal Offices, the premiated designs being published in this number:—

Mr. Mayor and Gentlemen,—In accordance with your instructions we have made a most careful and exhaustive examination of the many excellent schemes submitted for the above, and herewith beg leave to lay before you our adjudication on same. In the first place, we feel called upon to emphasise the pleasing fact that both for number and general merit the majority of schemes submitted are very exceptional, and as many able and carefully thought-out designs have been sent in, the difficulty of arriving at an equitable decision was considerably increased.

Each member of our firm has given every scheme a most careful perusal and investigation, and as a joint result of our anxious deliberations we have no hesitation in awarding the set of drawings numbered "13" the honourable position of first place. The author of this design has shown conspicuous ability in successfully dealing with the problem, both from the points of arrangement, construction and design. In every way the scheme is most meritorious and admirably adapted to the various purposes of your proposed structure, as set forth in the "Instructions to Architects," of which one of the most important (amongst many) has been faithfully fulfilled, viz. the cost.

Respecting our decision as to the awarding of second place, for which a premium of 25*l.* is provided, we experience considerable difficulty in advising you. Although many commendable schemes carefully conceived and most conscientiously developed and worked out by their authors respectively have been submitted, yet in each project are to be found many points of defect as compared with No. "13," the scheme placed first, and which can readily be seen on reference to the points of assessment previously given for your guidance.

Three schemes, however, viz. Nos. 17, 22 and 2, contain certain merit of their own either in plan or elevation, coupled with a sincere and earnest effort to faithfully solve your problem. These we have chosen as worthy of further investigation out of the thirteen selected by us in the intermediate round of elimination, and which were Nos. 2, 4, 6, 9, 13, 17, 19, 22, 26, 32, 34, 35 and 40.

After further consideration we are of opinion that the most equitable and satisfactory solution would be to bracket Nos. 17, 22 and 2 designs as equal second and make an allowance of ten guineas to each. It would be money well earned and also some little recompense for the time, labour and expense fruitlessly expended.

In conclusion, we can with the utmost confidence affirm, should your committee adopt scheme No. 13, chosen by us on their behalf, they will without doubt secure the best design submitted and one that most fully and adequately embodies their requirements taken as a whole.

Also, if the minor points of detail we have suggested be placed before the successful author, he will give them careful consideration when preparing the working drawings, and provide you with a structure in every way suitable for the several purposes intended and creditable alike to yourselves and Crewe. With the earnest hope that your Corporation may see their way to accept our assessment, which we feel certain will meet with the profession's endorsement, and sincerely thanking your borough surveyor for his courtesy and the valuable assistance he has rendered.

## DENE HOLES AT BEXLEY.\*

*(Concluded from last week.)*

A DANE by the Anglo-Saxons was called a Daene, and the plural was Dene; a den or cave was a denu, and a grave was a denn. Originally termed a denu, or denn, it seems probable that the English equivalent became a suffix to the Saxon word. In place names, as Mr. Pitt has pointed out, there are various similar instances. In the newspapers we may daily read of new novels; and by Bramshill we recently saw the sign of the Hatch Gate. It is not necessary, therefore, to regard a dene hole as the work of a Dane, though by the Danes some of them may have been used. The Adullamites of whom we read in the Book of Genesis lived in caves, and we may believe that the holy manger was a cavern in the rock. Many a gipsy child has been born in the caves near Nottingham, and Mr. Charles Wheeler, when writing of Tangleby Manor, told of the cave dwellings he had seen at Balaclava, which are still inhabited. In Sussex there are many excavations which are regarded as pit dwellings. As a rule they are close to a camp. There are some in the western slope of the Cissbury Camp, near Worthing; some are near the Trundle Camp on St. Roche's Hill, above Goodwood; by the camp on Wolstanbury Hill, near Hurstpierpoint, there is another group; at Hollingbury Castle, near Preston, there are others, and a few years back more were discovered at Lavant, near Goodwood. On Worms Heath, Chelsham, Surrey, there are various shallow pits in the gravel which are termed the Camp; no clue has been found as to their origin or use. Three caves discovered at Croydon last year are ascribed to the Neolithic age, and are regarded as having been places of refuge. The excavations in the rock by the river Leen, at Nottingham, are supposed to be the work of the ancient Britons, though now known as Papists' Holes. The Smugglers' Caves and Pipers' Holes in Cornwall, Mr. Potter regards as having originally served as habitations. The caves at Daddy Hole Plain, Torquay; the Tilly Whim Caves, near Swanage, and the many smugglers' caves along the coast, were formed by the action of the waves. Many are left high and dry; others can only be entered at low tide; while some, like the Hissing Well at Pagham, have yet to be explored when the waters recede. Norfolk and Suffolk take first rank in almost every feature that is of interest to the antiquary, and the excavations there, as stated by William White, are numbered by thousands. In most of the districts they bear a local name. On the Suffolk side of Brandon they are known as Grime's Graves; these are connected by galleries, and are regarded as the flint mines of Neolithic man. At Thorpe, near Norwich, they are termed Mouse Holes, and the open space containing them bears the name of Mousehold Heath. Aylmerston Heath is riddled with them, and there they are termed Shrieking Pits, probably from adventurous youngsters making their voices resound within them. At Beeston Regis, where they honeycomb the Heath, they are called Hills and Hollows. At Marsham Heath, Eaton, Weybourne and Edgefield they also abound. Many of them are lined with stones, and narrow trenches also lined with stones connect two or three together. These, there is little doubt, were the homes of the early Britons. In St. Clement's Caves, Hastings, it has been suggested that baptisms and other religious services may have taken place, and a like use was probably made of the cave at Royston, now being destroyed by the cold air admitted through the ventilator. In the champagne districts the wine is stored in caves; and in modern times excavations have been made in the White Rock, Hastings, for a similar purpose. The Dane Holes at East Tilbury are stated to be connected by a passage with those at Chadwell, near Little Thurrock. These are in Hangman's Wood, or rather Hanging Wood, its old name. In writing of them Morant carries down an old tradition that they are King Canobelin's gold mines. On the banks of the Somme similar excavations exist, many with passages leading to the parish churches. These are known as "Les outerrains des Guerres." The Barons' Caves at Reigate, with their long subways, the caves under Nottingham Castle, and the dungeons and other excavations under Hastings Castle formed part of the fortifications, and in the same class it seems reasonable to place the Magpie Caves at Hollingbourne. At Allericay, in Norsey Wood, near Brentwood, and elsewhere in Essex, dene holes are found. In Berkshire these hidden chalk pits exist; at Salisbury Plain they are seen, and a writer in the *Daily Graphic* mentioned some in Hertfordshire, where Mr. Harston has seen evidences of them in Tolmer's Wood. Kent chalk caves are numerous; one in Swanscombe Wood is known as Clappernabber's Hole. They are seen on Artford Heath, at Crayford, and at Aylesford, where they are regarded as sepulchral caves. They have stone slabs cover-

ing them, and are filled in with loose flints. Wright likens them to those at Etruria. Near Bexley, in addition to Stankey Wood, the holes are found in Joyden Wood and at Cavery Spring. At The Point, on Blackheath Hill, a chalk cave was discovered in 1780. It extends for nearly 130 feet, and contains four chambers connected by passages, with a well 27 feet deep in the furthest part. James Thorne described the cave as having a circular shaft like the dene holes. At Chislehurst there are numberless caves, which are termed draw-pits. In Camden Park there is a connected series of them, known as The Swallow. They were explored in 1857, and

CAVE DWELLINGS, BALACLAVA.

described by Mr. Latter, who stated they contained bones, and in some cases the entire skeleton, of the horse, pig, deer, dog and wolf, with what was believed to be the skull of the *bos longifrons*, an extinct species of the ox. Fragments of Romano-British pottery and a small piece of Samian ware were also discovered. Man in his time plays many parts, and so have caves. They have been formed by the washing of the waves and by the hand of man. They have served as habitations for families, as shelters for women in travail, and as refuges for women and children in the time of war. Warriors have made them their lurking-places, hunted felons have welcomed them as sanctuaries, prisoners have died within their walls. They have been used as places for secret meetings and for religious

\* A paper read by Mr. T. P. Wiggins before the members of the Upper Norwood Athenæum, with additional notes by Mr. W. F. Curdence and Mr. W. F. Potter.

services, and shepherds have rested in them on the hillsides while watching their flocks. Fasting anchorites have made them their cells, while for chieftains and holy men they have served as sepulchres. As silos for sweet ensilage, and as store-rooms for grain, wine and contraband goods they have been used, while some may have been merely mines for obtaining flint, marl, chalk, sand and gravel. Occasionally their uses are apparent, but more frequently opinions as to their origin can only be hypothetical.

Dene holes are first alluded to in Camden's "Britannia," where there is an account of some remarkable excavations near Tilbury, on the north side of the Thames, and which Camden supposes to be of British origin, and to have been made as granaries for corn, according to a custom of the Celtic tribes, for which he quotes Tacitus as his authority. On the other hand, Mr. Charles Roach Smith, the well-known antiquary, in a letter to the *Building News*, February 8, 1867, says:—"Camden must be in error in supposing these pits were used as granaries for corn. They are neither more nor less than chalk pits." Pliny, the naturalist, in speaking of the various kinds of earths, refers to the chalks and marls of Gaul and Britain, "marga," he says, being a Gaulish and British word. These pits were usually sunk as deep as 100 feet. There are a number of them at Billericay and Noresey Wood, near Brentwood, in Essex, and they are found on both banks of the river Thames. Other writers also took part in this subject in 1867, showing that these "pit dwellings," or "dene holes" existed in gravel and other districts. I think the word "dene" suggests its origin: it signifies a hollow or cave, and from which we derive the word "den." The word "Denmark," for instance, signifies the land of caves or hollows, and we have the "Deepdene," near Dorking. The *Daily Graphic* has published of late years, April 20, 1895, and September 23, 1898, some very interesting accounts of dene holes in Sussex, Kent and Essex, with illustrations, but it concludes its observations with the opinion that they are chalk pits, thus favouring the above suggestion of Mr. C. Roach Smith. In the illustrations or diagrams of the dene holes the *Daily Graphic* shows the plans of them in the three different counties, those in Sussex being quatrefoil in shape, those in Kent cinquefoil and those in Essex sixfoil.

In all cases they are most symmetrical in their plans, and very unlike what a chalk pit would be, which one would fancy would more resemble the plan of a coal mine. And, as has been pointed out, they have been found in other localities than in chalk districts. The "Dane John" at Canterbury is of similar derivation, though I am not sure that this has been proved to be hollow, but from this word we get the word "dungeon," which simply means an underground prison. These dens or caves abound all over the country, as the "Barons' Caves" under Reigate Castle, the St. Clement's Caves at Hastings, &c. In Cornwall they are called Smugglers' Caves, or "Pipers' Holes," and their history is so remote that I think we may be justified in calling them the prehistoric pit dwellings of our primitive ancestors. Some of the entrances to the Cornish caves are difficult. I went down one some years ago with a former member of the Upper Norwood Athenæum, Mr. John Hayward; it was called "Isa cwm pocha," whatever that may mean, and I do not know if I have spelt it correctly. The entrance to it was not only difficult, but it was difficult of description. Suppose you take a large sugar basin filled with half-inch cubes of sugar thrown loosely together, with two small flies on the top working their way down between the crevices to the bottom of the basin, then to imagine these lumps of sugar enlarged into blocks of rock about a ton weight each, or a cubic yard or two, and the two flies on top to be Mr. Hayward and myself, you will have a very faint idea of us, preceded by a pilot or guide, working our way down between the crevices of the blocks of rock for many yards deep, till we came into the famous "Smugglers' Cave" called "Isa cwm pocha."

Some do not think dene holes or caves could have been used as "pit dwellings," as we should die of rheumatism if we lived in them; but we must remember that man was more of an amphibious animal than we are now. Our monkish forefathers thought nothing of erecting their abbeys and monasteries in the most dismal swamps, and our towns were always constructed near to rivers, but now we seek the bracing air of tops of hills.

The history of caves is as old as Scripture itself, where they are frequently described. In fact, they are the beginning of architecture, as in the rock-cut caves and temples of ancient Egypt. Probably man found it necessary to seek shelter underground, not only from storms and foes, but from leviathans and species of animals which do not now exist.

Julius Cæsar\* describes the Britons, while on his march to London after the battle of Deal, being frequently attacked by them in his rear, they coming out of their woods and caves, probably the dene holes of Kent.

\* Cæsar also describes the ancient Britons as being "rovers and pirates," so they must have had some hiding-places when on shore.

## THE BODLEIAN TRICENTENARY.

ON next Wednesday and Thursday over two hundred guests from all parts of the world will meet at Oxford to celebrate the foundation of the Bodleian Library. It was said long ago by Robert Burton in his "Anatomy of Melancholy":—"How much are all we bound that are scholars to those munificent Ptolemies, bountiful Mæcenases, heroical patrons, divine spirits, that have provided for us so many well-furnished libraries as well in our public academies in most cities as in our private colleges? How shall I remember Sir Thomas Bodley among the rest?" That was a natural exclamation in a time when, without books, there was supposed to be no knowledge. Bodley himself was an opponent of the new science in the beginning of the seventeenth century, for he considered the hopes of Bacon about the future destinies of the human race to be chimerical. Afterwards he admitted that Bacon showed himself a master workman who was qualified to speak on the state of learning in those days.

It is hardly necessary to say that Oxford possessed a library two centuries before the foundation of the Bodleian. In the north-east corner of St. Mary's Church, over a dark and cavernous vault, is the site of the original University library of Oxford. This is a chamber 45 feet long and 20 feet broad. Here was begun about 1367, and finally established in 1409, the first actual library of the University, called after Thomas Cobham, Bishop of Worcester, who about 1320 (seven years before his death) set about building the room and providing for the books he had collected. Before this time, however, Wood tells us there were some books kept in chests in St. Mary's Church, which were to be lent out under pledges, as well as some chained to desks. Another precursor of the general library was the collection bequeathed to Durham College (on the site of which stands the present Trinity) in 1345 by one of its founders, the learned author of the "Philobiblion," Philip of Bury. On the dissolution of the college by Henry VIII. some of the books are said to have been transferred to the building in which Bishop Cobham's collection had by that time found a permanent and more spacious home, or rather had undergone what amounted to a new foundation. Before a score of years had passed since the completion and the opening of Cobham's library the needs of the University brought forward Duke Humphrey of Gloucester, the munificent patron of the new learning. Besides liberal gifts of money to the new divinity school then in process of erection, the duke came down with still richer contributions of books for the library. Between the years 1439 and 1446 he appears to have forwarded about 600 MSS., which were for the time deposited in chests in Cobham's Library. A catalogue of 364 of these MSS., printed from the lists preserved in the University Register, in "Documents Illustrative of Social and Academic Life at Oxford," edited by the Rev. H. Anstey, is in the series of Chronicles issued under the sanction of the Master of the Rolls. They were very varied in character. With works in divinity, philosophy and law were mingled treatises on medicine and science, together with many in lighter literature. There were no less than seven MSS. of Petrarch and three of Boccaccio. A bequest of additional MSS. contemplated by the Duke, being "all the Latyn bokes that he had," together with 100*l.* towards the completion of the "Divyne Scholes," was with difficulty procured, owing to his having died in 1447 without formally signing his will. We hear with surprise that only three out of all these MSS. are known to exist in the present library. Sundry of them appear in some mysterious way to have crept into the Harleian, Cottonian and Egerton collections now in the British Museum.

The original room at St. Mary's proving wholly insufficient to hold these additional treasures, the building of a new one was first intimated in a letter from the University to the Duke July 14, 1444. It was finally completed in 1480, and forms now the central portion of the great reading-room. The name of another liberal donor follows that of Duke Humphrey in the list of benefactors. Bishop Thomas Kempe, of London, besides largely contributing to the divinity school, sent some books in the year 1487, which, however, Wood complains, in a very few years began to disappear, being borrowed by scholars upon petty and insufficient pledges, which they chose to forfeit rather than restore the books. An imputation of this kind rests upon Polydore Virgil, who, being refused any further opportunities of abstraction, had to obtain a special license from Henry VII. for taking out any MS. Sir H. Ellis, in his preface to his edition of Virgil, attempts indeed to exculpate his author. The storm of Puritan bigotry did most, however, to disperse the gathering treasures of learning. In 1550 the Commissioners appointed under Edward VI. for reformation of the University visited the libraries in the spirit of John Knox. All MSS. ornamented with illustrations or rubricated initials were destroyed as Popish, and the rest exposed to indiscriminate injury and theft. The traditional reports of eye-witnesses handed down by Wood are abundantly confirmed by the well known descriptions of Leland and Bale as to what went on elsewhere. We hear of MSS. burned or sold to tailors for measures, and

bookbinders for covers and the like, until not one remained *in situ*. An entry in the University register completes the record of the catastrophe. On January 25, 1555-56, the vice-chancellor and proctors, with two masters of arts, one of them Mr Morwent, president of Corpus, were elected a delectio *ad vendenda subsellia librorum in publica Academia bibliotheca, ipsius Universitatis nomine*. The very shelves and stalls of Duke Humphrey's treasure were, in the name of that seat of learning, condemned for firewood.

Four years after this act of vandalism an undergraduate entered at Magdalen College who was destined thereafter to be moved by the sight of the ruin and desolation around so to reconstruct the old Plantagenet's library that the glory of the second house should eclipse by far the glory of the first. A successful student both of the classic and modern languages, and eager in the cause of learning, Thomas Bodley, on being elected a Fellow of Merton in 1563, undertook, without fee or reward, a public Greek lecture in the college hall. After some years spent in academic pursuits, Bodley betook himself to diplomatic service abroad, carrying with him still his affection for the ancient scientiarum sedes, the haunts of his earlier studies. Weary at length of statecraft and the ways of Courts, "I concluded at the last," he says in "Reliquiæ Bodleianæ," "to set up my staff at the library door in Oxon; being thoroughly persuaded that in my solitude and surcease from the commonwealth affairs I could not bring myself to better purpose than by reducing that place (which then in every part lay ruined and waste) to the public use of students." In a letter to the Vice-Chancellor, February 23, 1597-98, he offers to take upon himself the charge and cost of fitting it up with shelves and seats, of obtaining benefactions of books and of endowing it with an annual rent. Merton College found the timber. In two years the beautiful roof was put up, which is deservedly admired still. Bodley's arms are painted on the bosses dividing the panels which bear the arms of the University. The eastern wing was added in 1610, and the picture gallery in 1613-19. The original register of benefactions provided by the founder—two large volumes in vellum—is one of the curiosities of the library.

Among the first and largest donors of books in the year 1600 occur Lord Buckhurst (afterwards Earl of Dorset), the Earl of Essex, Lords Hunsdon, Montacute (patristic works), Lisle (afterwards Leicester), Lumley and William Gent, who gave a large collection of books, chiefly medical. Of the many books given about this time by Bodley himself, one was no doubt the famous copy of the French "Romance of Alexander," specially interesting for its numerous quaint illustrations of the customs, trades, amusements and dress of the time. Great use has been made of these by Strutt. The colophon shows that this work was four years in painting, and ends with the words, "Che liure fu perfaict de la enluminure au xviii<sup>e</sup> our dauryl. Per Jehan de grise, Lan de grace M.ccc.xliiij." The scribe's name is given as Thomas Plenus Amorix (Fulllove). Sir H. Savile and William Camden are registered as donors of books in the following year; but the greatest benefactor of the year was the first librarian, Dr. Thomas James, or love of whom Bodley consented to relax for once his stringent rule which till the year 1856 forbade the librarian to be married. Almost every year contains the mention of gifts from men of mark or rank. In 1603 Raleigh gives 50*l*. There seems to be some doubt as to the story of his having procured for Oxford the library of Osorius, Bishop of Faro, in Portugal, which was carried off at the capture of that place by Essex in 1598. In this year Sir R. Cotton presented, together with ten other MSS., the MS. of the Gospels, additionally believed to be one of the two copies of the old Galic version sent by Pope Gregory to Augustine in Britain, long preserved in St. Augustine's Abbey, Canterbury. The other copy is now among Archbishop Parker's MSS. in Corpus Christi Library, Cambridge. June 20, 1604, letters patent were granted by James I, styling the library by the founder's name, and licensing the University to hold lands, &c., in mortmain for its maintenance to an amount not exceeding 200 marks a year. Visiting the library in the year following, His Majesty recorded to have prosed as was his wont touching the fruits of learning, and to have uttered the mild witticism that the under's name should rather be Godly than Bodly, adding that ere he not King James he would be a University man. It seems, however, that the king's liberal offer of choice and rare books from the royal collection bore but meagre fruit. Dr. Ames's first catalogue both of printed books and MSS. was printed in this year. In 1610, by agreement with the Stationers' Company, Bodley, after "many rubs and delays," secured for his library copies of all books published by members of that body. This agreement was the precursor of the obligations secured by the Copyright Acts. An order of the Star Chamber was made July 11, 1637, confirming this grant. An ordinance of the Company was passed in 1612 for enforcing the obligation upon its members.

The permanent endowment of his library was commenced by the founder in 1611 by the purchase from Lord Norreys of

the manor of Hendons, near Maidenhead, worth annually 91*l*. 10*s*., to which he added certain tenements in Distaff Lane, London, yielding a rent of 40*l*.

Dying on January 28, 1613, Bodley was buried, by his desire, in the chapel of his college, with much state, and bewailed in two volumes of elegiac verse, among others by Laud in Latin, and Isaac Casaubon in Greek. One volume was entitled "Bodleiomnema," and the other "Justa Funebria Ptolemæi Oxoniensis." The bulk of his fortune, 7,000*l*. it was said, was bequeathed by him for the building of the east wing of the library and the completion of the schools. But it fell miserably short, "by reason of the fraud of his executor, the loan of a great sum of money to Charles I. in his distress, and by the fire of London," the tenements in Distaff Lane having no doubt been burnt. A curious present had been promised by Bodley of a cloak of "Tartar lambs' wool," sent to Sir Richard Lee by the Emperor of Muscovy. This singular garment was, after some time, recovered from Bodley's executors. Tradescant's first catalogue of the Ashmolean Museum mentions "a coat lyned with Agnus Scythicus," but it is not now to be traced. Agnus Scythicus is simply the woolly fungus-like growth of a large fern common in Tartary, which bears some resemblance to a full-grown lamb poised on the top of a vegetable stalk. In 1629 the valuable Barocci collection of Greek MSS. in 242 volumes, purchased by William Herbert, Earl of Pembroke, Chancellor of the University, was presented by that nobleman to the library. Some supplementary volumes kept back by the Earl were bought and presented by Cromwell. The gift of Sir Kenelm Digby in 1634 of 238 MSS., including the works of Roger Bacon, Grostete, Reade, Eschynen and others, was of immense value, chiefly as bearing upon the early history of science in England. Laud's great collection, consisting of nearly 1,300 MSS. in divers languages, forms a series of priceless treasures, pre-eminent among which are the famous "Codex Laudianus" of the Acts, in parallel columns of Greek and Latin, set down by Mr. Coxe and Dr. Tischendorf as written towards the end of the seventh century. Another famous MS. is a copy of the Saxon Chronicle, ending A.D. 1154, probably from the abbey of Peterborough. There is also a curious Irish MS. containing the Psalter of Cashel, Cormac's Glossary and the poems of SS. Columbkil and Patrick.

The known value of the library, even in a money point of view, by this time began to put it in jeopardy. A London newsletter of April 2, 1649, informs us that "the Jews proffer 600,000*l*. for Paul's and Oxford Library, and may have them for 200,000*l*. more." Happily, the rapacity of the Council of War running the figure up too high, this neat stroke of commercial business fell short of the mark. Selden's splendid bequest added no less than 8,000 volumes, nearly all bearing his well-known motto. The mere bringing the books from London cost 84*l*., and the providing chains for them, as stipulated by the executors, 25*l*. 10*s*. Of the wealth of this collection in classics and science, theology and history, and above all, in Biblical and Talmudical literature, it is impossible to give any idea. Other additions were of vast, though lesser, importance. Colonel Vernon's wonderful collection of early English poetry, the "Ormulum" and "Cædmon" of Francis Junius, the Oriental books and MSS. of Thomas Graves, and the still more precious accumulations of Pococke and Ussher, swelled year by year the riches of their several departments. The name of John Locke appears in the Register, A.D. 1704, as the donor of his own works, honourably coupled with those of Stillingfleet in reply. The Tanner MSS. in 1736 formed a bequest of inexhaustible service to antiquarians. The Clarendon series, so productive to the University exchequer as well as invaluable to the study of the Civil War, came into the possession of the library in 1753, through the bequest of Henry Hyde, Lord Cornbury, great-grandson of the Chancellor. In point of variety and bulk, no benefaction since the time of Bodley, Laud and Selden came up to that of Rawlinson, the nonjuring bishop. His only rivals since his day have been Gough and Douce. The largest sum ever voted for the purchase of works was 5,444*l*. paid in 1817 for the great collection of the Jesuit Canonici of Venice. The MSS. alone amounted to 2,045. Among them were fifteen MSS. of Dante, the first of that author which the library possessed. Malone's rich collection of English dramatic literature and poetry came in in 1821. But to enumerate fairly even the choice and exceptional treasures with which this wondrous storehouse of learning and intellect has been gradually filled during three centuries and a half would be to transcribe bodily from almost every page of its annals.

Messrs. Peter Bisset & Son, of North Street, Aberdeen, have obtained the contract for the erecting of the new post-office at Aberdeen. The amount of the contract, which includes everything but the tilework, woodwork, flooring and electric lighting of the building, is between 40,000*l*. and 50,000*l*.

## CLAY-WORKING INDUSTRIES OF GREECE.

THE American consul at Athens says that the modern pottery of Greece is principally of two kinds, viz. ordinary cheap crockery ware for common or general use, and fine ceramic pottery, artistically made and finished by men who have studied the art at the Polytechnicum, and who model their work after the celebrated ancient pottery of Greece, imitating the shape, colours, finish, &c. Some of these clay-workers become very proficient, and make fine imitations of many of the ancient styles. In the preparation of the clay for pottery, brick or tile the Greeks sometimes mix it by hand, but often in a simply constructed clay mixer, turned by horse-power. The ordinary or common pottery is very cheap, and is used for all kinds of culinary and household purposes. Jars, jugs, vases, bowls, basins, pots, &c., of a reddish colour, and usually unglazed on the outside, but glazed within, are in general use, and can be bought at very low prices. In many places, but especially on the island of Ægina, a cream-coloured water-jug or jar is made, which is so porous that when filled with water the moisture keeps continually exuding to the outside and there evaporating, which wonderfully cools the contents, especially when the vessel stands in the air. These cheap "water coolers" are used by everyone, rich and poor, and great numbers of them are manufactured and sold every year. These jars are very cheap, but friable. Many thousand jugs of the red ware are continually in use for carrying and holding water. Pottery manufactories are very numerous in Greece. In Athens there are a dozen or more, the most noted of which are in the "Keramikos" (clay workers') quarter in the western portion of the city, and on the "Sacred Way" of the ancients. They turn out many kinds of crockery, and some very good imitations of ancient vases, &c. In the Cyclades, and in all the islands of the Ægean Sea, there are pottery manufactories, and the pottery of each island has certain characteristics peculiar to itself, owing to the difference in the clay, or the method used in its manufacture. Roofing tiles are manufactured in immense numbers in Greece. In and near the cities and large villages there is scarcely any other kind of roof in existence, but in the mountain villages some of the roofs are covered with flat stones or slabs of stone. Tiles are manufactured in or near every city or town of any size in the kingdom, suitable clay for the purpose being plentiful and widely distributed. The tiles are made by hand, the only machinery used being a simple and primitive "mixer," turned by a horse or mule, which mixes the clay in a pit in the ground. With the exception of those situated in and near Athens, the outfit of the Grecian tile manufactories is neither elaborate nor costly. A tile manufacturer of the smaller towns can often carry his entire plant on the backs of two or three donkeys, and thus move from village to village where there is a demand for tiles. Drain tiles and chimney tiles are made in considerable quantities. Nearly all the chimneys on dwellings in Greece are simply tiles built into the walls of the building, and extending to 3 feet above the roof. Ventilators are made in the same way. With the exception of those producing marble, of which there are many good varieties, magnesite or other minerals, the mountains of Greece are principally limestone. Very few cities or villages of the kingdom are far from a limestone quarry, and the houses are frequently built of this material, many of the best buildings being faced or ornamented with marble. Most of the houses, however, are built of stone and stuccoed on the outside—and often on the inside—and painted in good imitation of marble. This stucco lasts many years on the exterior of buildings in Greece, where frost is seldom seen, and is cheaper than marble. In some country villages, where the quarries are very far away or the roads are bad, houses are often built of sun-dried brick, but in parts of northern Greece, especially in the small villages of Thessaly, houses are built by first erecting a frame of willow poles and rods, and then covering this wickerwork with a coating of mud or clay mortar. Sun-dried bricks are used in considerable quantities. The humbler houses in the suburbs of the cities of Athens, Piræus and Patras, and in many villages where stone is not plentiful or easy of access, are built of sun-dried bricks. In fact in some villages the houses are nearly all built of this material. Many fences or walls throughout the country are composed of blocks of clay one yard square and half a yard thick, made in a manner somewhat similar to the manufacture of sun-dried bricks. The bricks, as the name implies, are dried by the heat of the sun only. They vary in colour according to the colour of the clay used, and measure about 12 by 6 by 2½ inches. These bricks are made in every village, town and farm in Greece that has clay, and there are few places in the kingdom that have no clay deposits. Kiln-dried or burned bricks are manufactured in or near Athens, Volo, Chalkis, Pyrgos and elsewhere in Greece; they are of a hard quality and usually of a very light cream colour. It is said that no soft kiln-burned bricks are made. Kiln-burned bricks are used for the erection of chimneys in factories, foundries, &c., partitions in buildings, bakers' ovens and furnaces, and sometimes for building drains and sewers. Iron chimneys or "smoke stacks" are seldom

erected. On account of the limited use of kiln-burned bricks in Greece the manufactories of this material are few. There are but four or five of importance, and even these do not make bricks exclusively—they also manufacture tiles. Like the sun-dried, the kiln-burned bricks are made by hand, the only machinery used being the simple "mixer" propelled by horse-power. One man can mould 3,000 bricks each day. After the bricks are moulded they are allowed to be in the sun until partially dried, and stiff enough to handle easily. They are then built up in an "open work" manner, so that the heat from the fire can heat each brick. The fuel used is nearly always wood, and the fire, never very hot, is kept up for about fifteen days.

## ZIMBABWE RUINS.

THE secret of the ancient ruins of Zimbabwe, with its acropolis, temple and forts, has not yet been laid bare. It is still uncertain to whom we owe these mysterious structures and at what date they were erected. A very good case has been made out for identifying Zimbabwe as the Havilah of the Old Testament, and for supposing that Phœnicians or descendants of Phœnicians had a hand in its erection. One thing is certain, that the buildings are not the work of any of the present natives of South Africa, although they may have been used over and over again by local tribes. Native implements found in the ruins prove this. Perhaps the greatest puzzle is the *raison d'être* of the situation of the ruins. The acropolis is situated on a kopje 250 feet high in a plain surrounded by hills, and affording an extensive view along several valleys. The temple is situated in this plain, and down one of the valleys there is a long chain of forts striking eastward as if making towards the coast. The curious part is that there are in the immediate vicinity none of the ancient gold workings which abound all over South Rhodesia, and there still exists the unsolved problem of the situation of Zimbabwe.

Perhaps in the near future the truth may be disclosed. The Government of South Rhodesia, says the *Scotsman*, have taken a very important step for the preservation of the ancient ruins. They have appointed Mr. R. N. Hall, who is joint-author with Mr. Neal of "The Ancient Ruins of Rhodesia," as temporary curator at Zimbabwe. It is to be his work to clear away all rubbish and vegetation that tends to conceal or to destroy the buildings. Mr. Hall arrived at his station on May 23 and already a great amount of work has been done. The walls enclosing passages which wind round and up the kopje to the enclosures on the top have been laid bare, and passages have been disclosed which were not previously thought of. Two of these passages, 20 and 30 feet long respectively, and between walls 8 feet high, were so concealed with rubbish that the visitor's path crossed right over them. Two large ancient entrances have also been discovered. They had been used by the native Makalangas for graves. Other architectural discoveries are a wall with dentelle pattern, a cement-lined enclosure and three wedge-shaped buttresses. The buttresses are of peculiar interest, being the first discovered in Rhodesia. Naturally, in the rubbish cleared away many "finds" have been made. These include the characteristic soapstone birds, beams and bowls. The birds are decorated in the usual fashion, and the beams and bowls show chevron and cord patterns and sometimes figures of animals. Pottery and iron tools have been discovered, but whether they are of very ancient date it is impossible to say. At any rate they are not such as are used by natives of the present day. Perhaps the most valuable discovery is a gold bangle of wirework, weighing 3½ ozs., and a beaten gold cap or ferrule.

Although the acropolis, with its winding walls of granite blocks, its monoliths and chambers, is the most imposing ruin the more interesting ruin and the one in which more "finds" are likely to be made is the temple in the plain below. A few months ago the interior of the elliptical temple was an impenetrable jungle of trees, bushes, tall grass and creepers. The monkey-ropes and the wild vine have committed great depredations, and the last remnant of the herring-bone pattern on the wall was fast disappearing. Mr. Hall's arrival was very timely. With the help of fifteen natives he has cleared away all the undergrowth and stumps, and now for the first time an uninterrupted view of the whole structure can be obtained. The most striking object is the large conical tower about 15 feet high, which is suggestive of the old Phallic worship. This cone has suffered somewhat from the growth of trees and is now slightly tilted. The architectural discoveries made in the temple are four ancient drains, a double-curved rounded entrance, three sets of stone steps, and several yards of ancient cement flooring. The cement flooring is not original with the building. There has also been made clear a large portion of architecture which is of later date than the original building but built on the top of an original wall. The finds in the temple are similar to those on the acropolis. Altogether 2 monoliths have been found. Among the soapstone ornament

is a section of an ancient soapstone bowl believed to be the missing portion of a large bowl lent by Mr. Rhodes to the Cape Town Museum. A collection of curious stones, foreign to the district and of odd natural shapes, was also found.

The work undertaken by Mr. Hall is purely that of clearing away the rubbish and making known the nature of the structures. No excavations are being made, so there is still plenty of scope for discovery. It is impossible to imagine that the Government mean to retain Mr. Hall only temporarily. The excellent work he has done insures his being entrusted with further research. There are so many old ruins in South Rhodesia that it will take years to investigate the whole of them. Mr. Hall has not been unmindful of visitors, and direction posts have been erected everywhere either to direct people to particular ruins or to indicate the particular nature of the chambers or enclosures. Zimbabwe is three hours' journey in a Cape cart from Victoria in the south of South Rhodesia. Victoria is reached by coach now from Gwelo, which in a very short time will be connected with Bulawayo by rail. Doubtless tourists in making the grand tour of South Africa through Kimberley and Bulawayo to the Victoria Falls will take the opportunity on their return journey to make a deviation to the unique ruins of Zimbabwe. It is to be noted that Victoria and Victoria Falls are not to be confused. They are several hundred miles apart.

### PEVENSEY AND JAMES I.

THE little village of Pevensey stands, a long row of cottages flanked by a stately church, which far outstrips parochial requirements, on the flats of Sussex, a few miles from Eastbourne, where the Downs terminate, and about a mile distant from the sea. The village like many another in rural England, says a correspondent of the *Scotsman*, seems to have changed little since Tudor times, which are recalled by the Tudor rose still lurking on several lintels, and by a few old houses of woodwork, which show that their construction came before the command had issued:—

England, build houses of lime and stone,  
For after wars ye shall have none.

So unimportant is the existing village that it has no mention in "Chambers's Encyclopædia," no exclusive pages. Yet the place was one of the chief towns in Britain at a time when there were no towns in Scotland at all; it minted money for Norman kings, and for centuries was a fortress, chiefly under royal keeping. In this capacity it was for a time the prison house of James I., whose romantic life and tragic end would be interesting, even if he had not been a charming poet in the dawn of Scottish literature, and a statesman who fostered commerce and maintained law in days when trade and legality were alike unfamiliar in Scotland. "The best of all the tuarts, a strong man who in short time did the country much 'sting 'good. I wish we knew more of him." So he was characterised by an old Scottish lawyer to the writer many years ago. Scottish readers perhaps may yet find interest in this short episode of his life.

Pevensey in Roman times was one of the great towns on the south coast of England; even now it is the most perfect relic of a Roman city on our island, probably the most perfect north of Treves.

The site was chosen because it lay on flat land and was open to the sea. In those days, and apparently until the time of Elizabeth, the sea washed the southern side of the town, creating the port of Pevensey; it has now receded more than a mile, as currents, meeting from east and west, have thrown up a bank of pebbles and sand, which now forms a portion of the land surface. To the north of the flat land lay the great forest of Anderida, the Weald of Kent, Sussex and Surrey. Twenty miles in length, twenty-five in breadth, its primeval sides might well have concealed an army of Britons, such as, rising from similar covering, well-nigh cut off the seventh legion of Cæsar in his famous expedition of discovery. The walls, towers and gates with which the Romans surrounded their city—perhaps named Anderida, although Cichester also claims the name—had nothing to fear from the attack of any British host. They were built so well that the gates and one tower and the whole circuit of the northern wall are standing to-day. Their meaning is plain—they formed a fenced city in a land of danger, the open plain guarded against surprise, the walls were defensible and impregnable, in case of siege the sea was open and the friendly shores of France at hand. The shape of the city is an oval, with good towers at either end and on each flank; in other words, it is a Roman camp, which grew in time into a fortress city, peopled by more or less peaceful inhabitants. A curious parallel to Roman Pevensey may be seen in the old city of Aosta, which stands high up in the valley of the Dora Baltea, at the point where the road leaves the river and strikes northward for the Pass of Great St. Bernard. The name Aosta is derived from

Augustus, who in B.C. 24 established a colony of veterans to keep the mountain marauders in check and the pass open to commerce. The camp chosen by the troops is still unaltered; the gates, the streets, parallel or at right angles to each other, and the market-place of Aosta still retain the outlines laid down by the pennons of the Roman camp-makers. The streets of Roman Pevensey are now beneath the turf, and cattle browse over the dwellings where the stout centurion swaggered of old to the enslaved Briton, or played with the children, to whom, as epitaphs reveal, he expressed himself with unexpected tenderness. Probably, on the recall of the legionaries in 409 A.D., some at least took ship at the port of Pevensey; the place therefore has its share in closing a period of our history; it is among the last spots on our island where the Roman eagles floated on the air.

Six centuries had passed ere another structure arose within the Roman precincts. William the Conqueror landed on the low shore of Pevensey. The spot is now a green meadow where he stumbled on the slippery pebbles, but encouraged his followers by exclaiming as he rose:—

Seigneurs, par la resplendeur de Dieu,  
La terre j'ai à deux mains saisie;  
Toute est notre, quant il y a.

A low line of hills marks the route of his advance to Battle, about 8 miles distant, the scene of his victory. To commemorate his landing a Norman castle was built upon the shore, inside the Roman walls, which were to some extent refortified. It was a royal castle, which only ceased to be a fortress in the reign of Henry VII, when the general use of cannon made such defences of little value, and only passed out of royal hands after the Revolution of 1688. There is still standing outside the walls a piece of ordnance, a conscientious antiquary would style it a demi-culverin, marked with the Tudor rose and crown, and the initials E.R. It was placed there in 1587 when there was a just fear of Spanish invasion.

The wandering Scot must often be struck by a contrast between the Mediæval castles of his own country and those of "our auld enemies," but present friends, of England. The contrast is in favour of his own country, else perhaps it would not be so easily observed. It is this:—The Norman castles of England were raised in a conquered country to keep down the inhabitants. The old castles of Scotland were raised in self-defence, to protect and not to devastate. Bodiam, in Sussex, is a terrible fortress, keeping open the road to France. Orford, in Suffolk, has a windowless dungeon, as perfect now as in the days of Stephen, when it was filled over and over with the hapless peasants of the district round. Rochester predominates over the Thames mouth, as Windsor does over the Thames valley, Northampton Castle over the Midlands. Ludlow Castle was manifestly made for the headquarters of an army; indeed, its possession by the Yorkist house turned the tide of war in their favour. So Pevensey was a garrison castle, and probably maintained several hundred mounted men. How they were employed, at least in the twelfth century, it is perhaps "better only guessing." Our Scottish castles, Lauder, Craigmillar, Borthwick, Seton, have nothing of this character. They were defensible against an enemy, but there is no visible mark of their having been garrisons of oppression so much as fortresses from which, when the owner issued "in effier of war," the neighbours, sworn to be his men, flocked to his standard.

In the year 1402 David, Duke of Rothesay, died suddenly in Falkland Castle. It was believed then, as it is believed now except by those who draw their historical knowledge from romance, that the Duke of Albany and the Earl of Douglas, the two most powerful men in Scotland, were both cognisant of his death. Scotland was unsafe for the heir to the throne, and in 1405 James, the only surviving son of the king, a young boy of thirteen years, set sail for France, to be educated there in safety. Off Flamborough Head his vessel was captured by an English cruiser; the prince was made prisoner, and delivered to King Henry IV. It was a time of truce, but Henry was a politic monarch; to the request that his prisoner should be allowed to pursue his voyage he replied that he could speak French as well as his brother of France, and was equally qualified to give a good education to the King of Scotland. The act has the appearance of being an open and flagrant outrage, committed with the plain object of holding Scotland in check by the detention of a hostage of prominent rank.

The prince, a prisoner and exile for nineteen years, had many wanderings. He was in the Tower, no good omen, at Nottingham for some years, at Windsor and at Pevensey. His stay at Pevensey was not long, but is still remembered. The old cicerone of the ruins—now in the possession of the Duke of Devonshire—still with the tenacity of local tradition points out the position of what he names the "royal apartments." They are in the first storey of a round tower, which stands apart from the main buildings of the castle, forming a portion of the outer wall. Floor and roof are gone, but the holes in the walls where beams were fixed mark the low height of the chambers, and

the windows remain, looking towards plain and forest on one side, and the castle garden on the other. It is a quiet place for study, with abundant opportunities for manly sports. The neighbouring forest 500 years ago still nursed the red deer and the boar, and the wolf perhaps had not wholly disappeared. Many jawbones of the wolf were found in the castle well when it was cleansed in recent years, and the writer rummaging an old kitchen midden in the rear of the royal apartments found the tusk of a boar along with oyster shells, if the reader loves particularity. "Sanglier à huitres" sounds appetising and fit to form a royal dinner.

The young king is best known, except perhaps to the Scottish lawyer, as the author of "The King's Quhair," quire that is, or book, in which he tells the story of his love for Margaret Beaufort, the lady of the Lancastrian house whom he afterwards married. He writes as an admirer and imitator of Chaucer the great poet, who had just passed away. James was about nineteen years of age when he was a prisoner at Pevensey.

No one who has read "The King's Quhair" forgets the scene where the writer, looking out from his tower, beheld his love walking in the garden, and was at once enthralled by her beauty.

And therewith kest I down myn eye agayne,  
Quhare as I saw walking under the towre  
Full secretly, now cumyn her to pleyne  
The fairest of the freschest younge floure  
That ever I sawe, methought, before that houre,  
For quich sodayne abate (surprise), anon astert  
The blude of all may body to my hert.

The words may possibly refer to no actual locality, but simply be a poetical reflection of the scene in Chaucer, where Palamon and Arcite both descry the fair Emily from the window of their prison. Windsor also was a probable place to meet Lady Margaret, and Sir James Ramsay may be right in asserting that the words just quoted refer to the first sight of his future bride "at Windsor." Still, no words could more accurately describe the scene of the "royal apartments" at Pevensey, and the view now—and undoubtedly for long time—visible from their windows; so that a visitor may well be pardoned if he imagines that the walls of Pevensey were at least not quite absent from his mind when he penned his description of this beautiful hour of his life; and, moreover, that the peaceful scene of the long village street, the farms and hedgeless meadows with cattle grazing for miles, almost untended, was not without its share in giving definite shape to the royal resolution that, if he came to his own, he would "gar the rushbush keep the cow."

## TESSERÆ.

### Giotto's Transitional Period.

IN the art of Giotto and the Giottoesques the transformation of sculpture and painting is fulfilled. It is an art lit up with the spirit of St. Francis, warm with Christian love, pure with Christian purity, simple with Christian humility; it is the fit language of a pious race endowed with an exquisite instinct of the expressiveness of form as form, but untrained as yet in the knowledge of the concrete facts of the outer world; an art fresh with the dew and tenderness of youth, and yet showing, together with this virginal quality of young life, a simple forcefulness prophetic of the power of its riper day. Within the outline of these general characteristics individuality found sufficient scope. Awe of the doom of the wicked, and a sense of inexorable retribution, inspired in minds of a certain stamp works full of a Dantesque severity and force; to others militant Christianity and theological allegory furnished a grateful field. Local peculiarities of temperament were reflected in local artistic production. In the work of the Florentines we trace that grave sobriety which so strongly marked them in the early days of their Republican freedom, and of which, later on, Angiolo Pandolfini was to draw an interesting picture. Among the Siennese, on the other hand, the love of luxury and splendour peculiar to them translated itself in the gay profusion of gold adornments, which in their pictures bespangled and enriched the gorgeous raiment of their virgins, saints and angels.

### Flaxman's "Shield of Achilles."

In 1818 John Flaxman, R.A., received a commission from Messrs. Rundell & Bridge, the silversmiths, for a model of the "Shield of Achilles" as described by Homer. "The poet's intention," says Pope, "was no less than to draw the picture of the whole world in the compass of this shield. We first see the universe in general; the heavens are spread, the stars are hung, the earth is stretched forth, the seas are poured round. We next see the world in a nearer and more particular view; the cities delightful in peace or formidable in war; the labours of the country and the fruit of those labours in the harvest and

in the vintage; the pastoral life in its pleasures and in its dangers; in a word, all the occupations, all the ambitions and all the diversions of mankind." In the distribution of the various scenes and probable measurement of the shield Pope followed Boivin, who laid the whole down to scale with mathematical precision; his love, however, of defined lines and want of sympathy with true art have made his memorable buckler look like a chariot wheel, with the twelve scenes painted and hung between the spokes. There are circles to the amount of nine, or more, with numerous intersections, which injure the general harmony of the workmanship. The size was settled and also the shape—there is sufficient evidence that the shield was circular, and if the buckler of Hector, which in the Sixth Iliad reaches from shoulder to ankle, be taken as a scale, that of Achilles could not be less than 4 feet in diameter. Flaxman has selected from Pope all that is in accordance with his art, and interpreted the rest for himself. He has lessened the diameter to 3 feet, dismissed one-half of the circles of Boivin, and the lines of intersection, intended by the Frenchman as divisions to the twelve scenes, are changed for faint and waving lines, which divide the groups sufficiently without offending the eye. Round the border of the shield he first wrought the sea, in breadth about three fingers; wave follows wave in quiet undulation; he knew that a boisterous ocean would disturb the repose and harmony of the rest of the work. Or the central boss he has represented Apollo, or the sun, in his chariot—the horses seem starting forward and the god bursting out in beauty to give light to the universe around him. The circle, of which Apollo is the centre, is in diameter little more than a foot, yet in this space he has pictured "The earth, the heaven, the sea, the sun that rests not, and the moon full-orbed. There also all the stars, which round about as with a radiant frontlet bind the skies; the Pleiads and the Hyads, and the might of huge Orion, with him Ursa called, known also by his popular name, the Wain." On the twelve celebrated scenes which fill that space in the shield between the ocean border and the general representation of the universe, he exhausted all his learning and expended all his strength. The figures are generally about 6 inches high, and vary in relief from the smallest visible swell to half an inch. There is a convexity of 6 inches from the plane, and the whole contains upwards of a hundred human figures. Of this magnificent work the artist was justly proud; he was paid 620*l.* for the drawings and model. The first cast, in silver gilt, price 2,000 guineas, was placed by the king on his sideboard; the second, of the same material and value, was presented by the king to the Duke of York; a third, of the same metal, was made for Lord Lonsdale, and a fourth for the Duke of Northumberland. Two casts in bronze were made by the proprietors for themselves, and three in plaster were prepared for the Royal Academy, for Sir Thomas Lawrence and for Flaxman himself. The shield of Achilles is one of the worthiest of all Flaxman's works; the very way in which he made it was peculiar—he modelled it roughly in clay, had it cast into plaster of Paris, and then finished it for the silver moulder. It was in this way that he made his chief works—one could work so felicitously in plaster as himself; it carried a softness and a beauty from his touch which it could derive from no other hand. Of the twelve wondrous scenes which adorn the shield there is not one which is not replete with beauty of its own. All is moving and breathing—there is the gentleness of peace, the tumult of war and the charm wedded love.

### Connoisseurship.

The real connoisseur is a character almost as rare as estimable as the affected connoisseur is common and ridiculous; but as there is no counterfeit of less value than the latter, so there is none more easily detected; the eye of taste discovers him at the first glance; and it would be no disadvantage to society if in all cases the impostor were to be exposed on the spot, as bad coin is sometimes nailed to the counter at which it has been fraudulently uttered. The true connoisseur is a man of sense and sensibility, led by the love of nature to the contemplation of art; superior to common cat and vulgar prejudice; his feelings are alive to merit, ancient or modern, living or dead. Having formed to himself a standard of reference, the result of attentive observation, accurate comparison and mature reflection, he can measure merit without consulting the critical scale of reputation; he can give his opinion of a picture without first inquiring the painter's name, and has even the courage and the kindness to distinguish contemporary talent, though unsanctioned by time or authority. The affected connoisseur, on the other hand, is the dupe of delusion, the creature of caprice; his code of criticism is a catalogue raisonné; he talks in technicals like a parrot, and takes a picture-dealer as his oracle of art; he judges of nature by pictures, and sees the model only in the imitation, having no criterion of judgment but that which is derived from the "whistling of a name" or the whisperings of an auction-room; he is unable to discriminate, and blames and

praises by the lump; borne down by the bulk of reputation, he has no test by which to assay its real purity, and separate the metal from the dross; conscious of his incapacity, he never hazards approbation but on the back of authority, and therefore sacrifices without mercy or remorse the claims of his contemporaries to the security of his own judgment, and covers his ignorance and insensibility of the merits around him with a cloak of affected and indiscriminate contempt. But the name of a great master is a passport through all the outposts of criticism; Raphael, Titian, Rubens, Correggio are sounds with which all the beauties of art are associated. The question is not so much the excellence as the authenticity of the work; the latter established, the former follows of course, and the contented enthusiast forgets in the fervour of his zeal that the greatest genius proceeds at first in ignorance and rises late from mediocrity; forgets that the accomplished master he admires was once an unskilful scholar, and often bestows on the abortive efforts of his inexperience that applause which should be reserved for the best productions of his maturity.

#### The Plan of the Abbey of St. Gall.

The famous monastic plan preserved in the Benedictine Abbey of St. Gall is not only the oldest architectural working drawing left to us, but a precise and authentic record of the manner of building in the ninth century, and in some ways more valuable than if it depicted a particular set of existing buildings, for it shows the ideal at which the enlightened builders of that day were aiming. It is a drawing on parchment, 2½ feet by 3½, dated 820, and sent to Gozpert, abbot of St. Gall at that time, by some friend who is not identified, for guidance or suggestion in the rebuilding of his monastery, which was then to be undertaken. Carefully and minutely drawn, it shows with much detail the arrangement of the buildings of a great monastery—the central church surrounded by cloisters, chapels, dormitories, refectories, assembly-rooms, kitchens, breweries, store-houses, wine-cellar, workshops, infirmary, dwellings for the abbot and for visitors, kitchen-garden, orchard—all that was needed by a numerous, active and well-to-do community, isolated and sufficient to itself. The church is a large basilica essentially of the Latin type, as we might expect, but with some modifications which show what congregations of monks were beginning to do even so early in the Carolingian period. It is some 200 feet long, with a nave 30 feet wide divided from the aisles by arches borne on columns and intended for a wooden roof; the only vaulting indicated is in the crypt under the choir. The transept is as wide as the nave, which is prolonged through and beyond the transept in an eastern arm, and the transept arms are parted off into side chapels for special services, making a defined crossing. There are both an eastern and western apse—a German characteristic that we see in the great churches of Fulda, Trier, Mainz, Worms, Laach and many others, which has been a puzzle to archaeologists—one great altar being here dedicated to St. Peter and the other to St. Paul. There are no less than fifteen altars in the church, the aisles even being divided into something like separate chapels by screens against which altars are set. Near the western apse, but standing apart from it in Italian fashion, are two round towers, which according to the inscription were accessible by winding stairs for overlooking the universe, towers not unnecessary for watching or defence, and connected with the church by galleries or bridges. We are entitled to believe that this plan, revised for an important occasion by some one who was evidently skilled in building, records the latest ideas of that progressive time.

#### Pisa and Durham.

One of the Pisan chronicles assigns the beginning of the metropolitan church to the year 1063. Another chronicle, also the great collection of Muratori, places the date twenty-six years later. To a Northern inquirer the difference is of no great consequence. In either case the building is contemporary with Durham; if we accept the earlier date it is also contemporary with Edward's work at Westminster and with Eldwine's work at Jarrow. In the history of art the difference made by a few years between Jarrow and Durham bridges over one of the greatest gaps on record. But, after all, Jarrow is a rude specimen of the style of which Pisa is the noblest monument, while Durham is the equal rival of Pisa in a distinct style. As a group, the buildings of Pisa are probably unrivalled in the world. Nothing can be more unlike the usual way in which the great churches of continental cities are crowded and jostled than the inferior buildings than the broad space which holds the four great ecclesiastical structures of Pisa. The duomo, the baptistery, the campanile and the campo santo all stand close together, apart from all other buildings, except the wall of the city itself, in a corner of whose circuit the wonderful group is placed. But it is hardly more unlike the position of these Italian churches—Venice, of course, being the crowning example of all—in which an attempt has been made to give effect to the building by making the front look out on a wide

open piazza. At Venice, indeed, St. Mark's is a mere appendage to the secular buildings of the commonwealth; it is the prytaneion which hallowed the home of its rulers. But even where the duomo or other great church stands more independently than it does at Venice there is not often the same air of an ecclesiastical quarter which there is at Pisa. But though there is at Pisa a distinct ecclesiastical quarter, its feeling is as unlike as possible to that of an English cathedral close. In England the close is commonly something cut off from the city; in some cases the city itself is simply something which has grown up outside the close. At Pisa, though we are in an ecclesiastical quarter of the city, we still feel that we are within the city, that the great church and its satellites were the work and the possession of its citizens, and not the separate domain of an ecclesiastical prince. So unusual a site was, beyond doubt, chosen advisedly. The metropolitan church was built on ground which had been occupied by a humbler church of St. Reparata; the original cathedral must therefore have stood on some other spot, most likely, as in most other cases, in the heart of the city.

#### Thorvaldsen and his Countrymen.

No artist of the nineteenth century has been more famous than Albert Thorvaldsen. In comparison with his celebrity, that of Turner, for instance, was perfect obscurity. This Thorvaldsen went from Copenhagen to Rome, and was received in every city with public hospitality and rejoicing. If he passed near a court the king invited him to his palace; if he passed near a seat of learning or the fine arts, deputations of savants or artists saluted him with flattery so unmeasured that the wonder is how he could endure to listen to it. But he seems to have taken all this very easily, and on the whole to have rather enjoyed it, though without much flutter of vanity. It would have turned the brain of any man of Southern race, but Thorvaldsen, thanks to his tough Northern organisation, bore it without any dangerous excitement. The most curious fact about it is, when we think of it, that this man was a sculptor, and that even of the cultivated classes not one person in fifty knows anything whatever about sculpture, or can tell first-rate from fifth-rate work when he sees it; and if we reflect further that a whole nation went mad about Thorvaldsen, we may be sure that the proportion of his adorers who adored on critical grounds must have been quite infinitesimally small, perhaps one in 500. Human nature is a curious study in many ways, and few of its peculiarities are more astonishing than its capacity for feeling intense enthusiasm about things of which it is absolutely ignorant, and will not take the trouble to inform itself. The enthusiasm of all these Danes about Thorvaldsen was strong enough to make them shout and sing and drag his carriage through the streets of Copenhagen, but it was not enough to make them study art and ascertain for themselves the merits of the artist. All this they found it easier to take for granted, and the faith which takes things for granted was never more vigorously manifested. We understand more easily a national madness about a soldier, or a ruler, or a religious teacher; but to see a little Northern people, usually remarkable for soberness and practical sense, going almost out of its wits about a sculptor who imitated the antique, is not this really extraordinary? If the Norwegians had a national enthusiasm for Tidemand the painter, this would be more intelligible, because he is Northern and national in feeling, and painting is a far more popular art than sculpture; but that the Danes should have been so delighted with a maker of pseudo-antique statues, however skilful the imitation, passes all understanding. If they had known Thorvaldsen personally very well, we might have attributed their adoration to a liking for the man; but they knew next to nothing about him, for he had always been an absentee, and though when he came back his long white hair and nice venerable look were of the greatest use to him, still the enthusiasm was already at fever point before the white locks came in sight on the Rota. The explanation of the Thorvaldsen mania in Denmark is that Denmark is a small country, and felt itself elevated by the European fame of one of its children.

#### Colouring of Picture Galleries.

There is generally a disposition to be prodigal of ornaments and gilding in such buildings. Without pretending that all decoration should be proscribed, there is less disadvantage in erring by deficiency than by excess; in fact, the pictures, &c., are the precious objects, and it is upon them that we must attract and fix attention. One of the most injurious things to the effect of pictures is their accumulation—their being crammed together; the position they then occupy, so different from that for which the painter destined them, diminishes the illusion which each would produce if it were in its proper place. Few, except the intelligent connoisseur and amateur, on seeing a picture exhibited in a gallery, experience all the effect which the artist wished to produce. Even the contiguity of the frame to the picture is destructive of the illusion of perspective; hence the difference between the effect of a framed

picture and the effect of the same picture when seen through an opening, which permits us to see neither frame nor limits; it then recalls all the illusion of the diorama. Statues of white marble or stone, as well as plaster casts, stand out well in a gallery, the walls of which are of a pearly-grey colour; and if we would augment the whiteness of the statues by neutralising the red hue which the marble, stone or plaster might have, we could colour the walls with a chamois or orange-grey tint. If, on the contrary, we preferred giving to the statues a warm colour, which many sculptors esteem so highly, the walls must be of blue-grey. Green walls will give to the statues a rosy tint, which is not disagreeable. The tone of their colour must be lower, the brighter we wish the sculptures to be. When there are bronzes, the colour of the walls of the gallery must be determined by that which we wish to predominate in the statues; because, as is very well known, the metallic alloy of which they are formed yields two very different tints; one green, acquired by exposure to atmosphere; the other the peculiar golden tint which it possesses where it is not oxidised. If we wish to exalt this green tint, the colour of the walls of the gallery must be red, while they must be blue to bring out the brilliancy of the metallic bronze, which has not experienced the action of the atmosphere. The walls of the gallery are considered as giving rise to effects of contrast and not of reflection.

### GENERAL.

**Professor Church** will commence his course of lectures to the students of the Royal Academy at 4 P.M. on Monday next. They will be continued on successive Thursdays and Mondays. The subjects will be:—Grounds for Painting; Classification of Pigments; Trials of Pigments; Selected Palettes; Vehicles and Varnishes, and Methods of Painting. The Anatomy Course will begin on October 27.

**Mr. Waller**, of Gloucester, has the supervision of the works of restoration and preservation which are being carried out by the Department of Woods and Forests at Tintern Abbey. Portions of the ruins, which long have remained hidden beneath several feet of soil, have been disclosed, notably the lay-brothers' quarters and the ancient watercourse made by the builders of the abbey.

**Westminster Abbey** was reopened for public service on Wednesday morning. Since Easter Monday it has been closed in consequence of the arrangements for the Coronation.

**M. Hasselrus**, a Danish sculptor now living in Rome, has received the commission for the bust of Shakespeare which it is proposed to erect in Elsinore in a position which will face the Hamlet Terrace in the fortress of Kronberg.

**Architectural Classes** are about to be conducted at the Durham College of Science. Mr. R. S. Twizell will lecture on design and architectural styles.

**St. Columba's Presbyterian Church**, Leeds, which cost to erect about 10,000*l.*, has been offered for sale, but, as the bidding only reached 2,700*l.*, the property was withdrawn.

**The Emperor of Germany** has subscribed 1,000 lire towards the cost of the memorial of Vergil, the poet, which it is proposed to erect in Mantua.

**The Cape Town Railway Station** is to be enlarged and improved at a cost of 140,000*l.* The Government have decided to lay out 1,000,000*l.* in the purchase of additional railway rolling-stock.

**The Annual Autumnal Lecture** will be delivered in St. Bartholomew-the-Great, West Smithfield, on October 11, at 2 30 P.M., and will be repeated on the 25th at the same time. All parts of the church may be visited after the lecture without charge, but a collection will be made towards the purchase of the remains of the cloisters, which are at present used as stables.

**As a Memorial** to the officers from the Royal Military College, Sandhurst, who have fallen in the war in South Africa, it is proposed to erect a reredos in the college chapel, which already contains tablets recording the deaths of 270 officers. The work, which is estimated to cost about a thousand pounds, will be entrusted to Mr. G. F. Bodley, R.A.

**The Works Committee** of the London School Board have accepted the offer of Mr. H. H. Robinson to take out the quantities for sanitary work at a uniform fee of 1½ per cent. for a period of six months. The former arrangement was that 2 per cent. was to be paid on all work under 2,000*l.*

**The Liverpool Architectural Society** will hold their first ordinary meeting of the new session on Monday, October 6. The President will deliver his opening address and the revised schedule of charges will be discussed.

**An Appeal** is made by the rector and churchwardens of St. Andrew-by-the-Wardrobe, Queen Victoria Street, for the sum of about 120*l.* which is required to complete the payment for improving the churchyard.

**A Prize** of 5*l.* has been offered by the Northern Architectural Association towards the expenses of a student who will spend at least a fortnight in England or lands abroad, and who sends by not later than July 31, 1903, a set of drawings consisting of three single and separate perspective architectural sketches in pencil, ink or colour, each on sheets size 15 inches by 11 inches; and three sheets of measured drawings, each sheet not larger than 40 inches by 26½ inches.

**Mr. Elliot Stock** has issued a new edition of the *Memoirs of Coutts & Co.*, the bankers, with photographs and illustrations. A facsimile of the first peerage published in England, viz. in 1734, has also been brought out. It is reproduced from the only copy extant, which is in the British Museum, and will be useful to students of genealogy.

**The Rossetti Memorial Window** in Birchington Church has been seriously injured by robbers who broke into the building.

**The Subscriptions** for the Queen Victoria Memorial now amount to 210,000*l.*

**Mr. Norman Hurst** has been instructed to engrave the portrait by Professor von Herkomer of the late Mr. Cecil Rhodes, painted in 1896. This picture was given by Mr. Rhodes to the Kimberley Club, who have given permission for one replica to be painted by Professor von Herkomer for the late Mr. Rhodes's family.

**Sir John Soane's** museum was the scene of a fire on Saturday night which originated in a bedroom on the top floor. The flames were overcome in less than a quarter of an hour.

**A Sanatorium** for consumptive patients has been completed at Aubrac. It is the first structure of the kind erected on a high altitude in France.

**A New College** is proposed to be erected in connection with the Western Congregational Union at Bristol, which is estimated to cost between 15,000*l.* and 20,000*l.*, to replace the temporary building now occupied.

**Lichfield Grammar School**, in which Addison, Johnson and Garrick were among the pupils, has been sold, with the headmaster's house and adjoining land, for 1,035*l.* A new school is to be built in Barrowcop.

**The Government of Jamaica** are considering two schemes for the construction of a sea wall at Kingston; one involves an expenditure of 40,000*l.* and the other 500,000*l.*

**Excavations** are about to be conducted on the site of the ancient temple of Hera, in Samos, by the Greek Archaeological Society. It was expected that the exploration would be conducted by German archaeologists.

**A Memorial** consisting of three stained-glass windows, together with a mural tablet of alabaster, has been placed in Cranbrook Church, Kent, to the memory of the Rev. William Eddy, vicar of the parish from 1591 to 1616. The donor of the memorial was the late Robert Henry Eddy, of Boston, Massachusetts, who was a descendant of William Eddy, and who bequeathed a sum of 5,000 dols. for that purpose.

**M. Georges Lemaire**, who is preparing the war medal for French troops who were engaged in China, has departed from precedent in modelling the figure of the Republic by substituting the white head-covering of European officers in the East for the classic helmet.

**An Exhibition** illustrative of the history of costume will be opened at St. Petersburg in November. Among the attractions will be the robes of the sovereigns of Russia in ancient and modern times. The German Emperor has promised a collection of military uniforms belonging to various epochs.

**South Shields** proposes to borrow 60,000*l.* for the purpose of erecting new municipal buildings.

**A Bill** has been introduced in the Legislative Council of India to vest in Government powers similar to those exercised in the United Kingdom under the Works of Defence Act, 1860, to enable the military authorities to maintain clear of buildings and obstructions such zones of fire in the vicinity of works of defence as are essential to their defensive value under the conditions of modern warfare, and in view more especially of the increasing range of firearms.

**The Parish Church**, Little Marlow, Bucks, is now being restored. In the chancel wall was found an old "priest's door," which had been so completely blocked up that only a careful inspection could trace any indication of it in the rough rubble surface that the wall presented. Careful cleaning and clearing out has given back the complete stone arch with some of its mouldings. The second "find" is the original opening to the rood-loft, though no indication remains of the position or character of the steps by which it was approached. The third discovery was made within a cavity in the wall which constituted once the opening to the loft, and consisted of a Norman piscina, which retains its dog-tooth mouldings. This was deposited in the hollow space left when the surface of the entrance was plastered up. It is to be replaced in the corner from which it was torn.

THE

## Architect and Contract Reporter.

## EDITORIAL NOTICES.

*In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.*

*The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.*

*The authors of signed articles and papers read in public must necessarily be held responsible for their contents.*

*No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.*

*Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.*

## TENDERS, ETC.

*\*\* As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

## COMPETITIONS OPEN.

**CAPE TOWN.**—Jan. 31.—The Council of the University of the Cape of Good Hope invite designs for the erection of university buildings: Premiums of 400*l.*, 200*l.* and 100*l.* will be awarded to the authors of the designs placed first, second and third respectively. Particulars of the competition may be obtained on application to the Registrar at Cape Town, or to the Agent-General in London.

**GREENWICH.**—Oct. 9.—Designs are invited for a public library (with chambers for chief librarian's residence) to be erected at a cost of about 6,500*l.*, with fittings, on a site about 7,000 feet super, in the borough of Greenwich. Premiums of 50*l.* and 30*l.* are offered. Particulars can be obtained on application to the Greenwich Borough Council.

**HULL.**—The Corporation invite designs for extension of town hall. Premiums of 300*l.*, 200*l.*, and 100*l.* respectively. Particulars from Mr. E. Laverack, town clerk, Town Hall, Hull.

**INDIA.**—Nov. 1.—Competitive designs are invited for the erection of a memorial to Her Majesty the late Queen Victoria at Allahabad. A premium of 2,000 rupees will be awarded to the design selected by the committee. Mr. H. Nelson Wright, Indian Civil Service, honorary secretary, Queen Victoria Memorial Fund Committee, Allahabad, India.

**NEWARK.**—Oct. 14.—Designs and suggestions are invited for alterations and additions at the infirmary, Bowbridge Road, Newark, comprising a board and committee-room, a new mortuary and provision for twenty extra beds. A prize of twenty guineas is offered for the best plans sent to the office of Mr. M. H. Colton, clerk, 27 Lombard Street, Newark.

**STROOD.**—Oct. 15.—Plans are invited for further hospital accommodation on a site recently acquired by the Strood Rural District Council in Whitehill Road, Cobham. A premium of 15*l.* 15*s.* is offered for the best set of plans submitted.

## CONTRACTS OPEN.

**ACCRINGTON.**—Oct. 21.—For new works, Spring Hill, for Lang Bridge, Ltd.: (contract No. 2) erection and completion of the superstructures; (3) supply and fixing of constructional iron and steelwork. Mr. Henry Ross, architect, 15 Cannon Street, Accrington.

**ANDOVER.**—Oct. 9.—For erection of a brick culvert at Amport, Andover. Mr. W. R. Graham, clerk, Rural District Council, Andover, Hants.

**AYLESBURY.**—Oct. 8.—For installation and maintenance of electricity for a term of years. Mr. Percy A. Wright, clerk, Town Hall, Aylesbury.

**BRADFORD.**—Oct. 11.—For extension of shop at Low Moor. Messrs. France, Milnes & France, architects, 99 Swan Arcade, Bradford.

**BRANDON.**—Oct. 6.—For erection of a post-office at Brandon, Suffolk. Mr. James Farley, architect, Old Cross, Hertford.

**BRIDLINGTON.**—Oct. 20.—For construction of underground lavatories in South Cliff Road. Mr. A. E. Matthewman, town clerk, Town Hall, Bridlington.

**BRIMINGTON.**—Oct. 11.—For new schools to be erected at New Brimington, near Chesterfield. Mr. W. Cecil Jackson, 29 Knivesmith Gate, Chesterfield.

**BURTON-UPON-TRENT.**—Oct. 22.—For erection of a car depot in Horninglow Street. Particulars may be obtained at the Borough Engineer's Offices, Town Hall, Burton-upon-Trent.

**CARLISLE.**—Oct. 10.—For erection of four houses in Hawick Street and the conversion of eighteen tenements into eleven houses; also twenty-six tenements into thirteen houses in Duke Street. Mr. H. H. Hodgkinson, architect, 9 Lowther Street, Carlisle.

**CHESTERFIELD.**—Oct. 11.—For erection of schools at New Brimington, near Chesterfield. Mr. W. Cecil Jackson, architect, 29 Knivesmith Gate, Chesterfield.

**CORNWALL.**—Oct. 6.—For alterations and additions to the Tinner's Arms, Zennor. Mr. N. C. Whear, jun., architect, Penzance.

**DOVER.**—Oct. 24.—For erection of new coastguard buildings, consisting of quarters for an officer and seven men, with watchroom, &c., at East Cliff, near Dover. Particulars may be obtained at the Coastguard Station, East Cliff.

**DUDLEY.**—Oct. 11.—For erection of a new upper standard school, with caretaker's house, playgrounds, boundaries, &c., for the Dudley School Board. Messrs. Barrowcliff & Allcock, architects, Mill Street, Loughborough.

**EASTBOURNE.**—Oct. 9.—For alterations to the police station at the town hall. Mr. Wm. Chapman Field, borough architect, Eastbourne.

**ECCLES.**—Oct. 8.—For erection of a public mortuary proposed at the town's yard, Patricroft. Mr. Wm. Henry Hickson, town clerk, Town Hall, Eccles.

**EXETER.**—Oct. 6.—For structural repairs to the public baths and washhouses, King Street. Mr. Geo. R. Shorto, town clerk, Exeter.

## SPECIAL VENTILATING GEARING FOR CELLS.

Can only be operated from outside, by the regulating movement, and cannot be tampered with inside the cell. Only one Ventilator is shown in illustration, but any number can be worked with the one movement.

**FRED VERITY & SON, CALL LANE, LEEDS.**

PRICES ON APPLICATION.

**TRADE NOTES.**

THE Belgrave Hospital for Children, London, is being warmed and ventilated by means of Shorland's double-fronted and single-fronted patent Manchester stoves in glazed faience with descending smoke flues.

MR. J. PERCY DAY, 3 Victoria Street, S.W., sends us samples of Euboelith, patent flooring and copies of numerous testimonials as to its durability and cleanliness from users who have adopted it in hospitals, public buildings, factories, &c. It is claimed for "Euboelith" that it is adaptable for all kinds of floors, and is jointless, waterproof and fire-resisting, and not affected by heat or cold.

THEIR balance sheet, which shows 7 per cent, and carried forward no less than 3,350%, is the best testimony to the appreciation of the excellent work done by Drake & Gorham, Ltd., in country house lighting. Work has been done or is in hand for Lord Spencer, Lord Berkeley, Lord Stanley, Lord Kenyon, Lord Ducie, Lord Dudley, Lord Harris, Lady Price-Fothergill, Sir William Cuthbert Quilter, Sir T. V. S. Gooch, Sir W. Young, Sir W. Colville, &c.

WE have received from the Hine & Waters Flexicle Cowl Company, Ltd., particulars of the "flexicle" cowl manufactured by them. Its construction permits of a free passage of the sweep's brush by the opening of two pivoted portions, which automatically return to position after the brush is withdrawn, and obviates the necessity of a revolving head. It is also claimed for this cowl that owing to the impossibility of down-draught and the certainty of an up-draught, it is specially adapted to act as a terminal for ventilating shafts.

**ELECTRIC NOTES.**

THE Colwyn Bay Town Council has resolved to practically double the resources of the electric-lighting station.

THE Dorking Urban District Council has decided to borrow 20,000% for an electric-light installation.

THE Boston Town Council has applied to the Board of Trade to extend its provisional order, and is, we understand, open to negotiate with any company that may wish to come in.

THE Caerphilly Urban District Council has commissioned Mr. R. H. Fletcher, their electrical engineer, to apply for a provisional order for supplying the district with electricity.

THE Wakefield City Council has resolved to apply to the Local Government Board for sanction to borrow 15,000% for electric-lighting purposes.

THE St. Helens (Lancs) electric supply committee have instructed the town clerk to apply to the Local Government Board for sanction to the borrowing of the sums of 5,600% for extensions of mains, overhead work, &c, and 2,000% for the erection of a retaining wall, and the alteration of railway sidings at the power station, Cropper's Hill.

AT a meeting of the Berwick Harbour Commissioners a lease was sealed of a portion of the old shipbuilding yard on Berwick quay to the Urban Electric Supply Company for the purpose of erecting installation works. The company have for some time been in negotiation with Berwick sanitary authority for the electric lighting of the town.

AN important extension of the municipal tramway system at Brighton has been agreed to by the Town Council. The amount to be expended is nearly 40,000%. One of the new lines will connect the Royal Pavilion with the Central railway station, another will stretch to the limit of the borough along the Dyke Road, and a third, though only a short line, will have the important effect of linking the Brighton system with the projected tramways for Hove. The committee reserved for a future report a project for bringing the service within touch of the King's Road, near the West pier.

THE Edmonton District Council was recommended to invite three electrical engineers to submit reports and estimates of the cost of schemes for carrying out the electric-lighting order of the Council (1) for generating station and generating plant, and (2) for electric mains and distribution, and also an estimate of annual expenses and revenue. Also that the North Metropolitan Electric Power Supply Company be invited to submit their terms (1) for supplying electric energy in bulk, and (2) for supply and distribution complete for all purposes. The report was amended to the effect that others besides the North Metropolitan Company should be invited to tender, and was then adopted.

A LOCAL Government Board inquiry has been held at Barrow concerning an application by the Corporation for sanction to borrow 20,000% for the purpose of extending the electric-lighting system. The town clerk explained that the application was being made in consequence of an increased demand for the supply of electricity, and also in respect of an agreement entered into with the British Electric Traction

# BRITISH MANUFACTURE

## HIGH-CLASS ENAMELS

### For all DECORATIVE WORK.

---

#### "O" QUALITY "INDIAN" QUALITY

FOR INSIDE USE. FOR OUTSIDE USE.

The attention of ARCHITECTS, BUILDERS, DECORATORS, &c., is directed to the following points in the use of these special Enamels:—

BRILLIANT GLOSS AND HARD SURFACE.

EASY FLOW AND MANIPULATION UNDER THE BRUSH.

ENORMOUS COVERING PROPERTIES.

USED SATISFACTORILY BY MOST OF THE LEADING DECORATING FIRMS IN THE KINGDOM.

Made in any Tint or Colour required, or may be Tinted with Tube Colour Stainers.

MANUFACTURED BY

ASPINALL'S ENAMEL, Ltd. New Cross, London, S.E.

Company for a supply of current for the proposed reconstructed tramway system. It was three and a half years since the current was first supplied by the Corporation, and the demand was now so great that the capacity of the works was practically exhausted. The total amount already borrowed was 58,575/. It was proposed to ask for repayment over a period of thirty years, and that the commencement of the repayment be deferred for three years. The inspector said that he was afraid this would not be allowed, as the Local Government Board had decided they had no power to grant it. It was anticipated the extensions would meet the requirements of the borough for two years.

At the last monthly meeting of the Wallasey District Council the gas and electricity committee made a recommendation that the Council apply to the Local Government Board for sanction to borrow 52,350/. for electricity extensions. The matter was referred back in order that it might be discussed by the members of the tramways, gas and electricity committees. A meeting of this joint committee has been held, and a statement of the engineer, showing the probable requirements of the electricity works in the matter of capital expenditure for the next seven years, was considered, and it was recommended to the finance committee, who in turn recommended the Council to borrow the sum named. In view of a report of the electrical engineer, the gas and electricity committee recommend that the charge for electric energy to the tramways committee be 1½d. per unit instead of 2¼d., and that in regard to the charges for energy to consumers in the district there be a reduction in the energy required to be consumed before becoming entitled to the lower scale of half unit per lamp, that is, two units instead of two and a half as at present, and a reduction also of 1d. in the lower scale, viz. from 4d. to 3d. per unit, the initial price of 6d. remaining.

### VARIETIES.

THE dedication of the new Roman Catholic church at New Ross, Ireland, took place on Friday last. The cost of erection of this building is upwards of 25,000/.

THE Bishop of Wakefield (Dr. Eden) last week consecrated a new chancel which has been erected at Christ Church, Woodhouse, Huddersfield.

THE Crewe Town Council on Wednesday decided to make application to the Local Government Board for authority to borrow 15,000/. for the erection of the new municipal offices.

AN anonymous donor has offered to give a free library and museum to Beverley provided that a suitable site is obtained. A committee of the Corporation is to report on the subject.

A NEW convalescent ward, erected at the Barnsley Beckett hospital by Mr. William Moore in memory of his late wife, was formally opened by the donor on the 25th ult. The structure has cost about 350/.

THE new entrance lock to the South Dock at Swansea, constructed at a cost of 100,000/., was formally opened on the 25th ult. The new lock, which is 375 feet in length, provides 34 feet of water, an increase of 10 feet. The first vessel to enter was the Glasgow steamer *Tweed*.

THE first sessional papers' meeting of the Manchester Society of Architects will be held on Thursday next, October 9, when Mr. Alfred Darbyshire, F.R.I.B.A., F.S.A., &c., will read his presidential address.

THE new Primitive Methodist chapel which has been erected at Badshot Lea was opened on the 26th ult. It is built of red brick with stone facings, and has a beautiful stone turret. The new building, which has accommodation for 220, is situated close to the old chapel, a comparatively diminutive structure which was erected in 1867, and will in future be used as a Sunday school.

AN extensive scheme for the complete ventilation of the tunnels of the Central London Railway has been prepared by Sir Benjamin Baker, consulting engineer to the company, and will be presented to the directorate. The scheme is understood to provide for the placing of air-pipes through the entire length of the tunnels and the laying down of a special pumping plant at the generating station at Shepherd's Bush.

THE consecration of the new church of St. Michael and All Angels, Cornholme, Todmorden, was performed by the Bishop of Wakefield on Saturday afternoon. The new building provides seating accommodation for about 500 persons. It supersedes an iron building erected a few years ago, when a mission was first established at the Cornholme end of Harleywood parish, and is in the centre of a fairly large population.

THE new Roman Catholic cathedral at Durban is rapidly approaching completion. It is an imposing structure of

**Dr. ANDREW WILSON writes as follows:**—"The Filters sold by the Berkefeld Filter Co., Limited, London, W., remove all germs from water. They therefore represent ideal filters, giving pure (i.e. germless) water, and thus prevent Typhoid and many other diseases."

**THE BERKEFELD FILTER CO. Ltd. 121 OXFORD STREET, LONDON, W.**

## ILLUSTRATIONS.

PREMIATED DESIGNS FOR PROPOSED NEW MUNICIPAL  
OFFICES, CREWE.

150 feet in length and over 60 feet wide. There is a fine vaulted roof and a tower 120 feet high. The floor, arches and columns are of marble, brought from Carrara. This is the first building in Durban in which arches of this material have been introduced. Adjoining is a commodious presbytery with a promenade, also a sacristy and a school.

THE new Barry Road schools, Northampton, which have been erected at a cost of 25,000*l.*, were formally opened on the 28th ult. The buildings, which were designed by Messrs. Law & Harris, architects, Sheep Street, Northampton, are throughout up-to-date in every respect, and nothing has been stinted to make them model schools. Accommodation is provided for 420 boys, 420 girls and 530 infants. An excellent swimming-bath and the necessary laundry has also been provided.

THE new church of St. Peter, Bounces Road, Edmonton, a thickly populated and poor parish, has been consecrated by the Bishop of Islington. The cost of the building (10,000*l.*) is defrayed by the Ecclesiastical Commissioners from money received by them for the sale of a site of one of the City churches. The new church is in the Gothic style, of red brick, terra-cotta, and faced with Portland stone. It is lofty and well lighted, the flooring being of wood, and seating accommodation for 840 worshippers, the seats being chairs, with a book rest and kneeling mats for each.

A REDEMPTORIST monastery at Monkwearmouth, Sunderland, was opened on the 25th ult. by Dr. Preston, bishop auxiliary of the Roman Catholic diocese of Hexham and Newcastle. The building adjoins St. Benet's Church, and has cost 4,500*l.* It is said to be within a stone's throw of the spot on which over twelve centuries ago St. Benet founded the Benedictine abbey in which the Venerable Bede received his early monastic training. At present there are seven priests and five lay brothers in residence, but these numbers will be increased shortly, as the house is to serve as the headquarters for the Redemptorist Order in the North of England.

## BUILDING AND BUILDERS.

THE foundation-stone has been laid of a new Voluntary school to accommodate about 300 scholars at Pontefract.

THE corner-stone of a new gymnasium for the Ossett Parish Church Gymnastic Club has been laid by the mayor, Councillor W. Townend. The building is to cost about 300*l.*

THE Flintshire County Council have agreed to build a bridge at Higher Wych with the co-operation of the Cheshire County Council from plans prepared by Mr. Wyatt, of Ellesmere.

THE foundation-stones of two new Jewish synagogues for Hull were laid on the 26th ult., the one in Linnaeus Street and the other off Osborne Street, there being a sort of rivalry between two sections of the Jewish residents.

THE Merthyr Tydfil District Council, who have established large waterworks, are about to proceed to Parliament for powers to construct sixteen miles of aqueduct in connection therewith. The scheme, which will probably cost 100,000*l.*, contemplates sixteen miles of pipes. Twenty-inch mains will replace 12-inch mains from Upper Neuadd reservoir to Dowlais, in order that the supply to the works of Messrs. Guest, Keen & Nettlefolds may be increased from half a million to one million gallons per day.

AT a meeting of the school committee of Dundee School Board, a letter was read from the Education Department refusing permission to use accommodation in one of the schools in the east end for the purpose of conducting cookery classes, and stating that a new school in that district was necessary. They advised the Board to proceed with the erection of the new building immediately, and in view of this instructions were given to a committee to look out for a suitable site as soon as possible. It is believed that the new school will involve an expenditure of 10,000*l.*

A NEW Primitive Methodist church, erected in memory of the late Rev. T. M'Pherson, who was a Methodist preacher for over fifty years, has been opened in High Lane, Chorlton-cum-Hardy, by Mrs. Leese. The chapel is of red brick with Bath-stone dressings, and has accommodation for 450 worshippers. The total cost, including the schoolroom, is 3,200*l.*, of which 1,600*l.* has been raised. A public meeting was held in the evening, at which an address was delivered by the Rev. T. Mitchell, president of the Conference.

**NORMAN & STACEY, Ltd.** DESIGNERS and DECORATORS,  
252, 253, 254, 255 & 256 TOTTENHAM COURT ROAD, W. (Oxford Street End).

MR. JAMES BARRON, C.E., has, as desired, submitted for the consideration of the local authorities a scheme for improving the entrance to the old or west harbour at Roseheart. Mr. Barron estimates the cost of the works of extension, including the removal and re-erection of a lighthouse on the extended pier, at 3,000/. Mr. Maconochie, M.P., has intimated his willingness to subscribe 100% towards the cost, and an application is to be made to the Fishery Board for a contribution.

THE foundation-stone of the new church at Port Sunlight was laid on the 30th ult. by Mrs. W. H. Lever. The edifice, which will be called Christ Church, is being erected upon land adjoining Church Road. It is in the Gothic style, will be constructed inside and externally of Helsby red sandstone, and will accommodate a congregation of about 800, although on festival occasions room could be provided for 1,000. In addition, there will be accommodation for a choir of 40. The architects for the church are Messrs. Wm. & Segar Owen, Warrington, and the construction is being carried out by Messrs. Lever Brothers' building department.

MR. F. ST. GEORGE MIVART held an inquiry at the Widnes town hall, on behalf of the Local Government Board, into the application of the Town Council for sanction to borrow 675% for the purchase of certain property on the Widnes Promenade for the purpose of extending the accident hospital. There was no opposition. The town clerk (Mr. Oppenheim) said the property proposed to be acquired was Nos. 5 and 6 Terrace Road. It immediately adjoins the existing hospital, which was situated practically in the middle of a comparatively large estate belonging to the Corporation which formed the West Bank Promenade, the site of the hospital and the Victoria Promenade, which was constructed to commemorate the Diamond Jubilee of Her late Majesty Queen Victoria.

MAJOR J. STEWART, R.E., Local Government inspector, recently held an inquiry at Altrincham into an application for sanction to borrow 3,716% for the purchase of slaughter-houses and land at Hale Moss and the erection of additional slaughter-houses and refuse-destructors, also 800% for a scheme for supplying water for public baths and street watering. Mr. J. G. Whyatt, clerk to the Council, laid before the inspector particulars of the present indebtedness and also the rapidly increasing population of the district, showing the urgent necessity for carrying out the object sought by the inquiry. In opposition to the slaughter-houses and destructor scheme the clerk to the Hale Urban Council said that they had

no objection to the slaughter-houses and destructor being placed on the site first chosen in Altrincham, but they strongly objected to their being placed on the Hale portion. Mr. Crooks, chairman of the sanitary committee, said the Altrincham Council had the intention of putting the destructor on the Hale side. The inspector said the result of the inquiry would be reported in due course.

MR. ALDERMAN SHAW laid the foundation-stone on the 17th inst. of a new fire station for the borough of Salford, which is to be erected in Albion Place, The Crescent, during the next year. It will be situated right in the heart of the borough, and in whatever direction a fire takes place the drive will be downhill. The site includes 5,595 square yards, of which 2,700 are leased from the Booth charity for 999 years at a rent of 110% a year, and the rest is freehold. The cost of the building, including the other portion of the site referred to, will be about 25,000/. It will provide accommodation for seventeen officers and men, with their families, and for seventeen single men if required. There is also additional space for the erection of further housing accommodation. In the new station there will be accommodation for four horse machines fully manned, which, it is calculated, will be ready to turn out simultaneously in 15 seconds.

THE foundation-stone was laid on the 25th ult. of new schools which are being erected at a cost of 5,000% at Far Forest, Worcestershire. The site is an ideal one on the elevated land in the New Road, commanding fine views of the surrounding landscape. It measures about two acres, but a portion of the land will be reserved. The schools and house are being erected with red Staffordshire bricks, and will be roofed with Lewis's Cannock tiles. The gables will be relieved by half-timbered work, and there will be a handsome bell turret. The main building will consist of a mixed school for 100 children. The central hall will measure 48 feet by 24 feet 6 inches. This will be divided by a patent movable glass screen. There will be two large classrooms, with separate cloak-room and lavatory accommodation. The infant school will be 25 feet by 22 feet, with a separate entrance and cloak-room. The whole of the floors will be laid with wooden blocks. To each section there will be a separate playground, and covered play-sheds will also be provided for the wet weather. The buildings will be heated by hot water throughout, the infant schoolroom being also provided with an open fire. The heating vault will be beneath the infant school. The teacher's

house will be a very substantial and roomy building, and as a whole the block will present a handsome appearance. Mr. J. Pritchard, of Kidderminster, is the architect, Messrs. Dorset & Co., of Cradley, the contractors, and it is expected that the work will be completed next spring.

AN influential gathering of those interested in the promotion of the public health by means of good plumbing was held on the 29th ult. at the Fishmongers' Hall, under the auspices of the Worshipful Company of Plumbers. Mr. Bailie Crawford, of Glasgow, the warden of the Company presided, and among those present were Sir James Crichton Browne, Dr. Whitelegge (chief inspector of factories), Mr. Shirley Murphy, Professor Armstrong (of the City and Guilds of London Institute), Mr. L. Gomme (clerk to the London County Council), and Mr. R. J. Coles (clerk to the Plumbers' Company). Referring to the efforts of the medical profession to destroy the tuberculosis bacillus, Sir James Crichton Browne reminded those present that bad plumbing, damp houses and mildew were active agents in the spread of the dread disease.

THE members of the various businesses connected with the building trades of Harrogate and district have secured conveniently situated rooms in the Central Arcade, Chapel Street, on a lease, and have established a building trades exchange and club. One of the principal objects has been to have a suitable meeting-place for the members to have business and social intercourse, and the club is to be run on similar lines to the one at Halifax. The suite includes large billiard-room, smoke-room, reading and committee-rooms, and stewards' rooms. The capital is 1,000l., divided into 1,000 shares of 1l. each; each member will be a shareholder, but no member is to hold more than twenty shares. About half the shares had been taken up by Saturday. Mr. Riley Fortune (president of the Harrogate and District Builders' Association) presided, and the mayor (Alderman D. Simpson) in an appropriate speech declared the premises open. A smoking concert followed.

NEWGATE PRISON.

WITH the demolition of Newgate prison it became necessary to erect a suitable building for the reception of prisoners awaiting trial, which, while fulfilling a temporary purpose, would nevertheless be strong, fireproof and soundproof, and, of equal

importance, one that could be speedily erected, the time allotted in which it was to be completed and handed over to the authorities ready for occupation being the short period of three months.

The system of construction by means of patent dovetailed corrugated metal sheeting introduced by the Fireproof Partition Syndicate was selected, and on the vacant site between the present building and the Old Bailey courthouse a temporary Newgate is rapidly being constructed by them. We give some interesting illustrations showing the work in progress, but before further referring to them we may with advantage remind our readers of some of the special features of this system briefly, as we have on previous occasions fully described it, and pointed out the numerous advantages derived from its adoption.

By special machinery a patent dovetail corrugation is given to the metal sheets, imparting to them great strength, and providing a perfect double key for the plaster, which requires no support to keep it in position while being applied.

When used to form a fireproof partition a T iron is fixed across the ceiling, from this H-iron standards are fixed at suitable distances, through which the sheets are brought to the floor level, where channel iron shoes keep them rigid and in position. In the wall a wall channel is placed to receive one end of the sheet, the other being held in position by the H-iron standard; the next sheet is held by this and the next standard, and this process is continued until the last sheet is secured in the opposite wall channel at the other end of the partition, and are then ready to receive a plastic material which may be applied to both sides of the sheets at the same time. The partition when finished is from 2 inches in thickness, according as may be required, and has been proved after severe tests to be fireproof as well as sound, damp and vermin proof. Should it be desired that wood skirting be fixed to one or both sides of the partition, it can be nailed direct to the partition, or wood fillets are placed in a few of the dovetail corrugations before plastering, and to these the skirting is fixed by screws or nails.

For fireproof floors the ends of the corrugated sheets are fixed on the inside of the lower flange of the steel floor joists, and may be bent or arched to admit of air space between the concrete floor and the ceiling below, or placed straight from joist to joist. When a suspended ceiling is required, sheets are fixed into H-iron bars secured to the floor joists by a patent clip suspender, and give a perfect key for plastering which acts as a protection to the bottom flanges of the floor joists.

**MUNICIPAL HOUSE BUILDING IN GLASGOW.**

IN one of the remarkable articles on "Municipal Socialism" in the *Times* are the following remarks about the Glasgow Corporation's experiments in building:—

Still another form of enterprise on which the rulers of Glasgow pride themselves is represented by their adventure into the domain of municipal house-building. Under the Glasgow Improvements Act of 1866 the City Corporation acquired possession of slum areas extending over 88 acres, and occupied by a population of 51,000 persons, the cost of the scheduled properties being about 2,000,000*l.* Clearances were effected, new streets were formed, and it was hoped that the vacant land would be taken up by builders and turned to account by them. A substantial portion of the land was disposed of to builders on chief rent or feu duty of a capital value of about 300,000*l.* But the charges imposed by the Corporation were very high, and the fact that such extensive clearances had been made, and the former population scattered to other districts, led to there being only a limited demand for shops and houses at that time, so that several of the builders lost very heavily by their speculation. Others were deterred from running the risk of sharing their experiences; and, as the Corporation declined to reduce the charges for sites, so as to give to the builders a reasonable chance of a fair return on outlay, the remainder of the land was left on their hands until 1888, when they resolved to carry out a building scheme on their own account. They then proceeded to put up a considerable number of shops and dwelling-houses, seven large lodging-houses, a laundry and a family home, the total value of the property thus erected by them being about 1,000,000*l.* To meet the cost of carrying out their improvement scheme the Corporation had levied on the rental value of the city a rate which was fixed at sixpence in the *£* for the first year, fourpence in the *£* for the next four years, with subsequent reductions until one penny in the *£* was reached, at which figure it stood until it was finally abandoned in 1888. The charge on the rates thus extended over a period of more than twenty years, and the total amount actually contributed by the ratepayers has been put at 600,000*l.*

In return for this expenditure the city gained what was undoubtedly a very great improvement in the disappearance of many narrow streets, filthy courts and insanitary and over-

crowded dwellings, and the substitution for them of new and broadened thoroughfares, with healthy dwellings, shops, &c. But there was no suggestion of any attempt to rehouse the people who had been ejected from the demolished areas, the new dwellings being, as a rule, such as only well-to-do artisans, Corporation officials, clerks, shopkeepers or professional men could afford to rent. It is said there are even members of the Town Council itself living in some of the municipal dwellings. The 51,000 persons dishoused from the insanitary areas were mostly left to migrate into other districts of the city.

As regards the Corporation lodging-houses, it is true that at the time they were started they were a distinct advance on anything that private enterprise had done on these lines; but private enterprise soon began to provide lodging-houses fully equal to those of the Corporation, and there was then no need for the latter to continue the business. It is equally true that there is an increasing demand for accommodation in the Corporation lodging-houses—especially on the part of men who regard them as municipal houses of refuge from wives whom they wish to leave, and who give false names so as to escape detection when their wives inquire for them; or of other men who, earning good wages, want to reduce the cost of living to a minimum so that they can spend as much as possible in drink. There is good reason to fear that the so-called housing problem in Glasgow is largely a drink problem. In a certain condemned area in Glasgow I found an intelligent woman, evidently of a respectable type, but dressed in rags, having a blackened eye and a bruise on the forehead, and accompanied by four children who looked a very picture of misery and neglect. To the question, "Where will you go when you have to leave here?" the woman's reply was, "Oh, we should be all right if he would only keep off the drink. He earned 4*s.* 6*d.* yesterday, but spent 4*s.* 2*d.* on drink, and brought me 4*d.* to keep the house on, and he knocked me about, as you see."

The "family home" set up by the Corporation was intended originally for both widowers and widows with families, the idea being that the children could be cared for there by responsible persons while the parent went out to work; but developments took place which were not in the municipal programme, and the widows were got rid of, accommodation being now available only for widowers. But at no time, it is said, has the home been more than three parts full; and whether a municipality should devote the public funds to any such enterprise at all is open to question.

So serious was the state of things brought about by the Corporation's pulling down the poorest class of houses without making any provision for the poorest class of people that in 1890 the Glasgow Workmen's Dwellings Company, Ltd., was formed by certain prominent citizens, with a capital of about 40,000*l.*, not with the idea of curing the evil with such very modest means, but in the hope of affording some "object-lessons" alike in the building of "simple, sound houses," capable of being let at minimum rents, and in improving the structure and the management of dilapidated slums, so as to convert them into habitable and remunerative dwellings, instead of demolishing them altogether. It was thought that if these object-lessons were a success the city authorities and other agencies would be encouraged to follow the example set. The company thus played the rôle of pioneers in Glasgow, for the Corporation, be it remembered, had up to then made virtually no attempt to house the poor, and had dealt only with just the cream of the artisan classes. In the course of ten years the company invested the whole of its capital in erecting six large blocks of new dwellings on two sites, one in the north and the other in the east of the city, and in purchasing 26 blocks or tenements of "neglected and dilapidated houses, hotbeds of disease and crime," which either have been, or are in process of being, thoroughly renovated and converted into decent homes. But it seems that for some years after the completion of the first block of new tenements the company's building operations were suspended, "largely," says their secretary in some "Notes" published by him on these "Experiments in Housing," "from uncertainty as to the policy of the Corporation in providing much-needed housing accommodation for the struggling labouring class." On this same point Dr. Smart, Professor of Political Economy in the University of Glasgow, in a lecture on "The Housing Problem and the Municipality," after describing what had been done by the company of which he is a member, added:—

"And all this without any help whatever from the Corporation, indeed, with not a little of ignorant if not ill-natured obstruction. I say this perfectly frankly. It only illustrates the tendency of a great successful municipality not to help, but rather to hinder, any private agency which presumes to do the same work as itself."

Meanwhile, that is to say in 1897, the Glasgow Corporation obtained a further Act which authorised them to acquire and deal with six other insanitary areas, the condition of which had been rendered so much worse as the outcome of the policy

already carried out, that they were undoubtedly a source of danger to the public health. It was held, however, that the sites thus to be cleared were too valuable to be utilised again for housing purposes; and the Corporation were further empowered to acquire 25 acres of land elsewhere, either within the city or within a radius of half a mile of the boundary, for dwellings for the poorer classes. The Corporation were also authorised to borrow 560,000*l.*, to be repaid within sixty years, and to levy a rate of 1*d.* in the pound, to enable them to carry the Act into effect. Yet here again there has been no attempt on the part of the Corporation to rehouse the particular classes ejected from the fresh lot of slums. They even successfully petitioned the Secretary for Scotland to be relieved of the responsibility of making any such provision, representing that there was already ample accommodation in the immediate neighbourhood of the areas in question. So where the slums had stood before the Corporation erected five and six storey warehouses, workshops and other commercial buildings; while municipal dwellings, suitable only for people earning wages of not less than from 22*s.* to 26*s.* a week, are being put up at Alexandra Park, which, as Professor Smart has pointed out, "is a mile and a half from any centre of industry and from the present slums, and the site selected is about seven minutes' walk from the car terminus." It is, indeed," he adds, "among green fields; but it is questionable whether green fields are as attractive as they should be to the class in question. Cynical people suggest that the new gasworks are being built in the vicinity, and that the need of accommodating Corporation employes may have something to do with the new tenements." The profits realised by the Corporation from the commercial buildings on the areas cleared within the city are to be applied, as far as necessary, to the relief of the dwellings beyond the city boundaries, the idea being that it will thus be possible to accommodate the tenants at cost price, or even less, without any charge falling directly on the rates. A further reduction in the cost has been effected through building on some surplus land acquired from the parks and cleansing departments, which have not wanted it for their special purposes. One sees, therefore, that the tenants of these dwellings will well deserve to rank as a privileged class; and that should be doubly the case if, besides being allowed to occupy dwellings erected in these specially favourable circumstances, they should indeed be mostly municipal employes, engaged at the neighbouring gasworks.

In any case the direct result of the policy carried out by the

Glasgow Corporation in regard to the housing question has been to check the further development of local private enterprise along the lines laid down by the Workmen's Dwellings Company. Professor Smart says of that company:—

"It has built to the limit of its capital. It could raise more capital, or it could start other companies. But it stays its hand for two very good reasons—(1) Because it cannot afford to rent at cost; and (2) because, even if it were willing to, there is no use in private people losing money to do what the Corporation is going to do, presumably without losing money."

The position is the more regrettable because no one who reads Mr. Mann's "Notes" on the operations of the company can fail to be struck with the great amount of good which has been done with such a very modest capital as 40,000*l.*, while still securing a return of 4 per cent. for the shareholders. One feels, indeed, that the Glasgow Workmen's Dwellings Company has really done more in its way towards the solution of the real housing problem than the Glasgow Corporation with all the funds at their command; and there is even the suspicion that the result of municipal policy in Glasgow has been to intensify the housing problem there, rather than to bring about any effectual remedy.

As for the individual builders at Glasgow, apart from the housing companies, their attitude on the question was indicated by a speech delivered at the last annual meeting of the Glasgow Landlords' Association, Ltd., by the president, Mr. W. C. M'Bain, who in the course of his address spoke of the necessity of maintaining their Association strong in membership and funds, so as to "repulse the repeated aggressive attacks by the Corporation," and added:—

"We do not object to the Corporation safeguarding the health and lives of the citizens; and equitable, well-considered schemes for the attainment of that object will meet with no opposition from us. But we do object to the fruits of our industry being filched from us, and to our legally-acquired property being treated as if it belonged to the municipality. House-owning is a business, and people embark in it as they do in railways, collieries and manufacturing—to turn an honest penny and make a living, and not for fun or to afford a target for faddists to shoot at. House-owners receive no favours from the Corporation, and none are asked, but we object to schemes which are founded on the lines of conferring 90 per cent. of the benefits on one class and placing 90 per cent. of the burdens on another."

### A YEAR'S BUILDING IN GLASGOW.

ON Thursday, the 25th ult., Lord Dean of Guild Dr. Robert Gourlay retired from office. The following address was given:—

I have to ask you to bear with me this morning while I, very shortly, go back on the work this Court has done during the past year. I think we may claim it to be a record, for, while on two occasions have the number of linings exceeded those granted this year, the value of those has never been surpassed. Three times in thirty years has the total value of the linings been over 2,000,000*l.* This year they amount to 2,549,698*l.*, or 424,449*l.* above the highest figure hitherto reached, and that was before the extension of the city in 1875-76, and during the boom in everything which preceded the failure of the City of Glasgow Bank. Of the above linings—669 in number—197 are for dwelling-houses and shops, 13 for public buildings, 10 for churches, halls and schools, 166 for warehouses, 244 for alterations and additions, and 39 are for new streets of 11,720 yards in all—equal in length to between 6 and 7 miles, the largest extension that has ever taken place in one year. Of the dwelling-houses, 611 are of one apartment—an increase of 234 as compared with last year, chiefly in the Eastern and St. Rollox districts; 2,420 are of two apartments; 1,527 are of three apartments. Of the three-apartment houses, more than one-half of those over the whole city are in the Queen's Park district, chiefly in Langside.

This is a significant fact, and shows that with the great facilities given by our railways and electric trams an increasing number of the well-to-do class are making their abodes in the country and suburbs; 292 are of four apartments, 143 of five and 356 of six. The single-room houses are 11.42 per cent. of the total apartments lined; two room, 45.24 per cent.; three room, 28.54 per cent.; four room, 5.45 per cent.; five room, 2.67 per cent.; and six room, 6.65 per cent. The districts in which the greatest amount of building is going on are Queen's Park, Mary Hill and the Eastern. The linings for houses in the first are 35.09 per cent. of the total; second, 13.38 per cent.; and third, 20.90 per cent. The value of those in Queen's Park is 660,300*l.*; Maryhill, 302,980*l.*; Eastern, 225,040*l.* These three districts represent 1,188,320*l.* of the total value of houses lined, viz. 1,458,710*l.*, as compared with 678,574*l.* in the previous year.

The value of the public buildings, churches, &c., passed by the Court this year was 1,090,988*l.*, as compared with 980,726*l.*

in that preceding it. These are represented by:—Public buildings, &c., 447,000*l.*; churches, halls and schools, 63,000*l.*; warehouses, stores and workshops, 349,000*l.*; alterations and additions, 230,000*l.* Besides ordinary applications for the erection of buildings, the Court has had during the year to deal with upwards of 100 petitions for the approval of plans of buildings of the warehouse class. The Court has also had to dispose of fifty-seven cases at the instance of the Procurator-Fiscal. These were principally for the inspection and protection of dangerous buildings, the inspection of large buildings and structures, such as churches, schools, grand stands, &c., and for orders on proprietors to repair defective pavements, &c. Several builders were also brought before the Court and fined for deviating from plans passed by the Court, and for allowing houses to be occupied before being certified. Many visitations were also made by the Court during the year, many of these being to inspect the site of buildings proposed to be erected in hollow squares. This is a new duty devolving upon the Court, under the Building Act of 1900, as is also the consideration and disposal of applications for the erection of hoardings or billposting stations. The Buildings Regulation Act of 1900 may not, as yet, be fully understood in all its clauses, but it has at times appeared to the Court that a little more help might have been given it by builders of great experience, their architects and their law agents, if, in their plans, even although it involved a small money loss, they had been a little more liberal in the matter of light and air. They would be benefiting in future years the dwellers around hollow squares and well-lighted back areas. The problem of the housing of the poor is still before us. May we hope that the Commission lately appointed here will be able to settle it in a way which will be a real help to those whom they seek to benefit, and furnish us with model dwellings in which the occupiers will take a pride, and which will be the means of lifting not a few to a higher platform in our social life?

During the year communications were received from the Faculty of Procurators containing certain suggested alterations in the procedure of the Court which the Faculty thought would, if adopted, expedite the business of the Court, and the Court being desirous to meet, as far as possible, the views of the Faculty, have had meetings with deputations from that body at which the suggestions were discussed and considered. One of the points discussed was a suggestion by the Faculty that the roll of cases should be called over at the commencement of the

sitting of the Court, as is done in the Sheriff Small Debt Court, and lining granted in those cases in which the master of works had no objections. Looking, however, to the peculiar character of the Dean of Guild Court, and to the fact that there are very few cases in which adjoining proprietors are not called, and are entitled to be heard, the Court, after careful consideration of the views of the deputation, was of opinion that to adopt the suggestion of the Faculty would neither save the time of the legal profession nor the public, but, on the contrary, would lead to delay and confusion. In this view the deputation acquiesced. The Court, however, thought that, to some extent, time might be saved were a rule passed providing for a longer lapse than at present between the lodging of plans and the day of the Court—say four days longer. This would give the master of works more time to examine plans—which, in consequence of the recent Building Act is very desirable; architects would have an opportunity of amending their plans to give effect to any objections by the master of works, and the legal profession would be able to consult clients, examine titles, &c., thus obviating in many instances a continuation of cases for the production of titles. This suggested alteration was communicated to and considered by a committee of the Faculty, who approved of same. The Court has accordingly resolved, and has to-day enacted, that petitions and plans be lodged on the Tuesday of the week preceding that in which the Court is held, and that the plans shall be examined by the master of works on the succeeding Wednesday and Thursday. On Friday, Saturday and Monday they will lie in the office of the clerk of Court, where they can be seen by anyone interested, and any amendments suggested by the master of works made thereon. The liners' meeting will be held as at present on the Tuesday preceding the Court, and any alterations on plans on the day of the Court, unless of a very trivial character, will not be permitted. The Court has also agreed to adopt a suggestion by the Faculty that the officer of Court number each copy petition served by him with the number that the case stands on the Court roll, and that when calling the case he should also call the agent's name where the petitioner is represented by an agent.

Another point that has been considered was a complaint by the Faculty that house factors and architects were in the habit of preparing petitions and appearing in Court either by themselves or by assistants on behalf of petitioners. The Court is aware that this has been permitted to a certain extent

from time immemorial—but only to a very limited extent in recent years—and while the Court does not feel called upon under present circumstances to pronounce any formal order on the legality of such a practice, it is of opinion that the practice should cease and that only petitioners themselves or their law-agents should appear. Another matter that has engaged the attention of the Court during the year has been the condition of the plans passed by the Court prior to 1885. These plans being public property are very often required to be examined and referred to. Hitherto they have been lying in the basement flat of the City Chambers and no inventory of them has existed. As a consequence much time and labour has been expended in searches, often unsuccessful. This year a complete inventory of these plans so far existing or traceable has been made by Mr. Ramsay and a suitable place in the City Chambers has been granted by the Corporation for their storage and safe keeping. They will in future be under the custody of the clerk of Court, and it is hoped that the labour expended in arranging the plans and preparing the inventory will prove of public advantage.

### SOCIETY OF ENGINEERS.

A VISIT was made by the president, Mr. Percy Griffith, and members of Society of Engineers on Wednesday, September 24, to the engineering works of Joseph Baker & Sons, Ltd., and the machine works of the Wicks Rotary Type-casting Company, both of which establishments are situate in Hythe Road, Willesden Junction.

These works are situated in Hythe Road, Willesden Junction, upon a branch of the Grand Junction Canal, which connects them directly with the Thames. They are, moreover, within a few minutes of the London and North-Western and Great Western Railway Companies' lines. The company have been in their present premises for about twelve years, and their shops are well equipped with modern tools and machinery by English and American makers. The manufactures carried on are chiefly machines for the bread, biscuit, chocolate and confectionery trades, also garbage destructors and several other kinds of industrial machinery. The first, or old, building is 270 feet in length, and is built along the banks of the canal. At one end of this building are situated the forge and the coppersmiths' and boiler-makers' shops. The central portion of the building is the machine and fitting shop. The company have adopted the

principle of keeping their machine tools and fitters' benches as near together as possible, in order to avoid the necessity of removing the parts of machines from one portion of the shop to another. This is a one-storey building, and at the further end is the packing and despatching department, which adjoins the wharf. On the further side of the wharf is the timber store and a shed for an experimental tram. The cast-iron and tool stores are arranged along one side of the main building.

The new shop is 230 feet long and has a gallery about 20 feet wide running round three sides of the building. The centre of this building is used as a fitting and erecting shop, the machines being ranged in double row against the sides of the building. In this shop there are several large vertical lathes and a large assortment of modern tools by the best makers. In the gallery are constructed the lighter machines, biscuit cutters, engraved wafer plates, speed reducing gears and the like.

The woodworking building is situated on the west side of the company's premises and is 82 feet long by 52 feet wide; it is fitted with circular saws, planing machines and various other woodworking machinery. The upper storey is used as the patternmakers' shop, and beyond which is the drawing office and photographic room. In the yard are the iron and timber stores, the centre of the yard being used as an erecting ground for travelling ovens and garbage destructor furnaces.

### AN IMPORTANT MAIN DRAINAGE SCHEME FOR GLASGOW.

In connection with the inspection of the Western Drainage Works on Wednesday, the 25th ult., by the members of the Glasgow Corporation, Mr. A. B. McDonald, city engineer, prepared the following notes descriptive of the important scheme which the Corporation has now in hand:—

The main drainage scheme for the collection and treatment of the sewage of Glasgow and the adjacent local authorities was authorised by special statutes in 1891, 1896, 1898 and 1901. The territory included stretches along both sides of the river Clyde for a distance of about fifteen miles, the superficial extent of the drainage area being thirty-nine square miles. This territory is likely to be increased by the inclusion of areas belonging to outlying local authorities.

The drainage area is divided into three sections, each

Steam Saw Mills, Canal Wharf, BASINGSTOKE, HANTS.

ESTABLISHED 1792. All kinds of English Timber in Stock. Gates, Sash Sills, Scantlings of all sizes, Plank Board, &c.  
LONDON AGENT: H. BRAZELL, 23 CASSELDEN ROAD, HARLESSEN, N.W.

distinct from the others, with separate works for the disposal of their sewage.

The first of these, authorised in 1891, and doubled in extent in 1901, comprises about eleven square miles, one-half being within the city, and the remainder in the landward district of the county of Lanark.

The works for the treatment and disposal of the sewage of this area are situated at Dalmarnock, and the drainage is collected and conveyed there by a main sewer constructed at the cost of the Caledonian Railway Company.

The second section was authorised in 1896, and includes the municipal area on the north side of the river, not provided for in 1891, the burghs of Partick and Clydebank and intervening parts of the counties of Renfrew and Dumbarton, the whole extent being fourteen square miles.

The works for the disposal of the sewage derived from this area are in process of construction on the river bank at Dalmuir, about seven miles below Glasgow.

The third section, authorised in 1898, comprises the whole of the municipal area on the south bank of the river, the burghs of Rutherglen, Pollokshaws, Kinning Park and Govan, as well as various residential and rural districts in the counties of Lanark and Renfrew. The extent of this section is fourteen square miles, and it may be enlarged by the inclusion of the burghs of Paisley and Renfrew.

The works for the disposal of the sewage of this area will be situated on the river bank at Braehead, about one mile eastward from Renfrew.

The collecting and intercepting sewers which connect with the Dalmarnock works have all been constructed and in successful operation since May, 1894.

The daily volume of dry-weather sewage treated there at the present time is about 16,000,000 gallons, which will ultimately be increased to 20,000,000 gallons.

The volume of dry-weather sewage to be ultimately treated at Dalmuir is 49,000,000 gallons, and the corresponding volume at Braehead will be 48,000,000 gallons.

For the collection and disposal of the 97,000,000 gallons of sewage within this divided territory there will be constructed 30 miles of sewers, varying in size from 2 feet 6 inches in diameter to 10 feet, the separate capacities of which have been calculated to discharge, in addition to the daily dry-weather flow of sewage, an amount of rainfall equivalent to one-quarter of an inch per day, or 214,000,000 gallons of combined discharge.

The principal features of the western scheme are the construction of an outfall sewer to convey the drainage of the higher levels of Glasgow and Partick to the works at Dalmuir, the construction of an intercepting sewer to collect the drainage of the lower levels of the city, the construction of an intercepting sewer to collect the drainage of the lower levels of the burgh of Partick, and a third intercepting sewer to convey to the Dalmuir works the drainage of the burgh of Clydebank.

The Glasgow and Partick intercepting sewers will be pumped into the outfall sewer at Partick Bridge, the lift being 37 feet. The pumping engines, three in number, are of the triple-expansion type, with plunger pumps, each being capable of raising 11,250 gallons per minute, or 16,000,000 gallons per day. Steam is supplied to these engines by four boilers, working at a pressure of 160 lbs. per square inch. The Clydebank intercepting sewer will be pumped at Dalmuir, the lift being 21 feet. The smaller engines at Dalmuir will be of the centrifugal type, and the power for the treatment plant will be transmitted by electricity.

Rather more than one-half of the total sewage of the western scheme will be carried to the Dalmuir works, where the whole contents of the outfall sewer will be delivered into the precipitation tanks above tidal level. The purified effluent from the tanks will pass by gravitation over a discharge weir into the river, and the sludge will be pumped into specially constructed barges and conveyed to sea.

On the south bank of the river the surface levels of the drainage area are less favourable for the conveyance of sewage and rainfall by gravitation than they are on the north side, dealing with the figures that represent the distribution of population at the present time, although the future development of the territory included will bring the volumes conveyed by the gravitation and pumped sewers into less disparity. A storm-water relief sewer will require to be constructed in Kingston district to discharge the rainfall carried by the outfall sewer.

The sewers to be constructed on the south side of the river follow for the greater part of their course the line of public streets and roads. There will be a pumping station at Pollokshields or Kinning Park, where the low-level sewage will be raised 35 feet, and another at Braehead, where the lift is to be 21 feet.

The sewage of Paisley and Renfrew can be brought to the works in low-level sewers, and will require to be pumped.

The works for the treatment of the Southern sewage at Braehead will, like those of Dalmuir, have the great advantage

of river frontage, with every facility of water carriage for receiving and despatching materials.

The system of sewage treatment which is now adopted at Dalmarnock is chemical precipitation by means of under-surface continuous flow. The drainage received at the works is of a complex and specially intractable character, consisting for the most part of industrial refuse, charged with suspended matters that vary from 20 to 1,000 grains per gallon. The treatment of such sewage is a matter of no ordinary difficulty, and the proportion of the chemical ingredients undergoes frequent change during the day.

After careful deliberation and much patient investigation on the part of the sewage committee and their advisers, it was resolved to adopt at Dalnuir and Braehead the same method of sewage treatment as that which has for the last seven years been in successful use at Dalmarnock, with this exception, that the sludge presses which, by the compulsion of the situation of Dalmarnock works, have been employed there are to be dispensed with, and the liquid sludge, as already explained, carried out to sea.

The most diligent inquiry regarding the methods adopted by other authorities in England failed to provide the sewage committee with any reason to justify them departing from what they regard as a securely ascertained and efficient system of sewage precipitation and disposal.

The working result of the sewage treatment in daily practice at Dalmarnock obliterates every trace of suspended matter and effects 30 per cent of chemical purification, calculated on the basis of oxygen absorbed in four hours at 27 degs. centigrade. The result may leave something to be desired, but it must be borne in mind that economy imposes a limit on achievement in this direction. The quantity of sewage disposed of at Dalmarnock at the present time is, as we have seen, about 16,000,000 gallons, and it is discharged into a tidal stream of fifty-fold volume.

It has not yet been ascertained by any scientific authority what degree of saturation is needed to secure innocuous conditions in the admission of sewage effluent into flowing water, but it may be safely asserted that there is in this case as near an approach to the complete elimination of every element of objection as could be wished for. Further down the river, at Braehead and at Dalnuir, the 97,000,000 gallons of purified sewage will come in contact with 3,000,000,000 gallons of tidal water, and may with safety be left to natural agencies for their further improvement, the more especially as the quality of

sewage to be dealt with hereafter on these lower reaches of the river will be of a simpler character than that which is presently treated at Dalmarnock, and consequently likely to yield an effluent of a better character.

There is the greater reason to expect this, as the form and dimensions of the precipitating plant at Dalnuir and Braehead will be more effective than the original installation at Dalmarnock.

The works there were designed by the late Mr. G. V. Alsing, and were justly regarded at the time of their construction as creditable in the highest degree to their designer, embodying, as they then did, the latest results of experience and scientific research. They were arranged for intermittent precipitation, and worked in connection with coke filters, through which the sewage effluent was passed on its way to the river.

More recently it has been found desirable to extend and convert the Dalmarnock works; the precipitation tanks are now worked in continuous flow, and the use of the filters has been abandoned, as it was found that the process deteriorated the effluent instead of improving it.

The precipitation tanks in course of construction at Dalnuir, which are to be worked on the system of under-surface continuous flow, are more favourably situated than those at Dalmarnock, each being about 750 feet in length, thus allowing opportunity for more complete precipitation than is effected in the shorter tanks at the Dalmarnock works, and effecting a saving in the reduced proportion of chemical agents required for the process.

The works authorised under the statutes of 1896 and 1898 include, as already stated, thirty miles of outfall and intercepting sewers, as well as four separate pumping stations, and two sewage works for the treatment of the collected drainage, one at Dalnuir, the other at Braehead.

The work that has been completed up to the present time represents only a small proportion of the whole. All the working drawings, details and specifications of the scheme authorised in 1896 were matured not long after the statute received the royal assent, and part of the work was commenced in the early months of 1899.

The other sections of the western undertaking might have been proceeded with at the same time, and in all likelihood would have been completed before this date had not the Town Council at the outbreak of the South African war directed that capital expenditure on works should be suspended owing to

the advanced rates of interest on money. Unfortunately, however, trade prices have so increased that work then prepared for has been resumed at a cost greatly exceeding the tenders obtained by the sewage committee at that period.

During the course of next year it is hoped that the work on the northern bank of the river will be so far advanced as to permit the greater part of the sewage derived from the western area being purified, and a corresponding improvement in the condition of the river brought about.

The works on the southern bank, the details of which have already been elaborated, will no doubt be pushed forward by the committee, although a longer time must necessarily elapse before their completion can be looked for.

### ELECTRIC LIGHT IN DUBLIN.

THE Irish section of the Institute of Electrical Engineers visited and inspected on Saturday last the new electric lighting buildings at present in process of erection at what was formerly known as the Pigeon House Fort. The new works are intended to supersede those at present in existence in Fleet Street, which have been found inadequate to meet the lighting requirements of the city. The site for the new station was acquired by the contractors on May 1, 1901. Considerable time was, however, occupied in pulling down the old buildings, which for many years had stood thereon, and excavating for the foundations, and it was not till some months had elapsed that the actual work of building was commenced. In January of the present year the erection of the chimney shaft was begun, and it has just been completed. It is 186 feet in height—about 50 feet higher than Nelson's Pillar—and its foundations are nearly 35 feet in depth. The main building, which measures 182 feet in length, 140 feet in depth and 60 feet high, stands on the eastern side of the new harbour. It is erected on massive foundations, averaging 10 feet in width, and the walls are exceptionally strong and substantial. Like the chimney shaft all the walls are built of Irish bricks by Dublin workmen. The boiler-house is 40 feet from the quay front of the harbour. The coal required for the works will be lifted from vessels lying alongside the quay opposite the station by a travelling crane and grab directly out of the vessels into hoppers in front of the boiler-house, and will be delivered into a bucket-conveyor running underneath the whole length of the boiler-house. It will be weighed automatically and conveyed into

the store at the end of the main building, and from thence it will be delivered to the hoppers of the mechanical stokers in connection with the boilers. By this arrangement the coal will be delivered from the vessel to the furnace without being touched by hand at an estimated cost of less than 2d per ton. The boiler-house is 180 feet in length and 53 feet wide. It will contain four Lancashire boilers and four Babcock boilers. These will be supplied by a pump-house. The feed proper will consist of the condensed steam from the condensers, supplemented by Vartry water. The supply of water required for condensing the exhaust steam will be taken direct from the harbour by an elaborate system of piping and wells situated 23 feet below the level of the boiler-house. The engine house, a bright cheerful building, is 150 feet in length by 50 in width. To reduce vibration to the lowest minimum the engines will be placed on foundations consisting of concrete 14 feet in depth. The plant will consist for the present of three-phase alternators, which have been built at the Geilikon works, Switzerland, and will be driven by four Duncan Stewart engines, two sets of 1,000 kilowatts each and the remaining two 500 kilowatts each. The engines will be capable of developing a combined total of nearly 6,000 horse-power. Overlooking the engine-room there is a switchboard-room adjoining the offices, stores, workshops, mess-room, &c. Nearly all the plant required at present is ready for erection. The generating plant is stored in the old submarine mining station, two of the boilers are already at the premises, the switch-boards will be delivered within the next fortnight, and the remaining portions of the plant are almost completed. The whole will be erected immediately after the roofing of the building has been finished. A current of 5,000 volts pressure will be generated at the station and transmitted without being reduced in strength to the distributing centre, which will be the existing Fleet Street station. From this centre high pressure cables will radiate to twenty district transformer sub-stations, in different parts of the city. At each of these sub-stations the current will be reduced to the pressure at which it will be supplied to private consumers, viz. 200 volts for lighting and 340 for power purposes. The system will cover 80 miles of street frontage, and there will be about 150 miles of cables. Of these over 100 miles have already been laid. For the carrying-out of the scheme with certain extras the Corporation has already sanctioned an outlay of 265,000l., which includes the liability incurred for enlarging the plant and rendering it capable of supplying the outlying district of Clontarf.

## CABOT'S INSULATING & DEAFENING QUILT.

### A PERFECT DEAFENER.

Prevents the transmission of sound through walls and floors by absorbing and breaking up the sound waves. The only deafener that does this. Send for Special Book on Schoolhouse Acoustics, illustrated.

### A SCIENTIFIC INSULATOR.

Contains innumerable minute dead-air spaces, giving highest insulating power. Warmer than back-plaster or six layers of rosin paper. Decay proof, and vermin-proof, and unflammable.

### FIREPROOF, DEADENING.

A fireproofing result infinitely superior to that obtained with sheet asbestos, and practically perfect sound-deadening, can be had in all kinds of buildings by using

### CABOT'S ASBESTOS "QUILT."

The only scientific deafener. Indestructible by decay, moths, or vermin.

	Per Bale.	Half Bale.
Single Ply ...	£1 : 11 : 0	£0 : 17 : 0
Double Ply ...	1 : 16 : 6	1 : 0 : 0
Asbestos ...	2 : 16 : 6	1 : 10 : 0

Bales containing 500 square feet each; half-bales 250 square feet. Weights: Single-ply, 80 lbs.; Double-ply, 120 lbs.; Asbestos, 190 lbs. per bale.

## CABOT'S CREOSOTE STAINS, FOR EXTERIOR WORK.

Unequalled for depth and freshness of colour, durability, wood-preserving properties, and freedom from blackening. Superior to paint for exterior woodwork, and fifty per cent. cheaper. One gallon will cover 100 square feet of surface, two brush coats.

## THE B. & S. FOLDING GATE CO.

19, 20 & 21 Tower Street, Upper St. Martin's Lane, London, W.C.

# The Architect.

## THE WEEK.

THE failure to pass the plans of the Brighton Electric Railway before the Examiner on Standing Orders has not deterred a syndicate from renewing the effort. Mr. F. H. CHEESEWRIGHT, the engineer-in-chief, says:—"The whole length of the line will be under 47 miles. The gauge will be standard gauge, with a central rail to transmit the electric current. The curves will be few and of large radii, the greatest not more than 1 in 120. There are no engineering difficulties whatever in the project. It is proposed that the railway shall be in tunnel about 13 miles of the total length, and that such tunnel shall be constructed 27 feet wide in the clear from side to side; this will allow room for workmen should two trains be in the tunnel at the same time, as well as avoid the train diminishing speed through the resistance of the air, and likewise secure perfect ventilation." His associate, Mr. ROBERT HAMMOND, believes it would be quite possible, with due regard to safety, to run trains at a speed of 100 miles per hour, but such a rate of speed would involve very heavy working expenses, and taking into account the question of economy, he recommends that the normal speed should be 75 miles per hour. The line could be constructed in about three years. Meanwhile the duty of the engineers is to make arrangements that will prevent a repetition of the gross carelessness which was manifested in the plans prepared a year ago. The country between London and Brighton is not difficult for such a survey as suffices for Parliamentary plans, and it will be discreditable if similar absurdities to those which excited laughter in the Examiner's office are again exhibited.

AMONG the residences in Versailles one of the most interesting is known as the Pavillon de Madame. It was constructed in 1780 for the Princess JOSÉPHINE-LOUISE of Savoy, who was married to the Count of PROVENCE, one of the grandsons of LOUIS XV., and afterwards LOUIS XVIII. He was styled Monsieur during his brother's lifetime, and his wife was therefore Madame. The building was in the fashion of the time when everything seemed favourable to royalty in France and a French Revolution was thought to be an impossibility. The house is accordingly decorated in a charming manner, with wall and ceiling paintings of great merit. For some years past it has been possessed by M. CHAUCHARD, the founder and for several years the chief proprietor of the Louvre, the great warehouse which every Parisian woman from the highest to the lowest is likely to have patronised. He now owns the most valuable collection of paintings in Paris, one of his treasures being MILLET's *Angelus*. M. CHAUCHARD does not forget the source of his success and the representatives of the men who helped to make him a millionaire. He has made over the beautiful Pavillon de Madame in order that it may become a house of retreat for old employés. In such a place men who have performed their task may find well-merited repose.

THE old Sardinian Chapel, which was approached from Lincoln's Inn Fields by an archway which was not graceful, was better known of late years as the church of St. Deselm and St. Cecilia. The origin of the first name was not manifest to all. The kingdom of Sardinia no longer exists and cannot be represented in London by an ambassador. But prior to the establishment of the kingdom of Italy the Sardinian Ambassador found it advantageous to seek an official residence in a different quarter of London. The law of nations an ambassador's house and any premises attached to it are held to be sacred, and at a time when his creed was prohibited by law a Roman Catholic could worship in the chapel of the Sardinian embassy as in similar buildings elsewhere. It was too big to be considered a private chapel, and it is doubtful whether there were ever enough Sardinians in London to fill it. Within and without it was suggestive of being raised quickly and inexpensively. The people who were antagonistic to the services held in it respected it in the most bigoted times. It was not until the Gordon Riots in the eighteenth century that vengeance was wreaked upon

the building. But as the ambassador's house was not respected, and TOWNLEY'S Greek sculptures were treated as if they were aids to idolatry, it was evident unusual excitement prevailed. All but the walls were destroyed. With such a precedent it would be judged impolitic to restore the building in a costly manner. The church had a history of about 250 years. It is now to pass away as an obstacle to the Strand improvement scheme, and a large sum will have to be paid for the right to demolish it. But at no time could it be said to be a credit to Italian architects.

THE accident which occurred in the Crewe Station last August suggests the necessity of supplanting cast-iron columns in railway stations and introducing others of steel or rolled iron. That, no doubt, would be an expensive improvement, but the contingencies arising from an increased traffic are almost enough to make it compulsory. At Crewe the down passenger train to Manchester was crossing at the north end of the station from the down platform line to the down main line. The vehicles in the rear were run into by two empty coaches, which had been propelled along the down main line foul of the crossing. One of the carriages in its derailment struck against two cast-iron columns supporting the station roof, and these two columns breaking, a portion of the roof about 25 yards in length fell down on to the permanent-way and the rear portion of the train. One of the roof girders in its fall crashed through the roof of one of the saloons, but fortunately both the saloons were empty, and no personal injuries were sustained by either passengers or railway officials. It is easy to imagine the loss of life which must have followed under circumstances less favourable. We suppose the coaches were moving from the force of the momentum they had received from an engine, and were consequently without a guard or guide to control their movements. The Board of Trade inspector says that the erection of cast iron pillars on the permanent-way between the lines of rails was a very undesirable arrangement, which is never used at the present day. It is true that in the latest railway stations steel is substituted for cast-iron, but several stations remain in which cast-iron columns exist, and which the impact of a few carriages is sufficient to overthrow, and to bring down a part if not all of the roof.

WILLIAM EDWARDS, who designed and constructed the Pont-y-ty-Pridd, which for long had the widest span of any bridge in England, used to be pointed out as one of the exemplars of the pursuit of knowledge under difficulties. He was described as an ignorant mason, but he had a genuine skill in engineering, and if he lived at a later time he might be regarded as the rival of TELFORD. His story has been retold in a history of the bridge, with an investigation as to its stability, by Mr. W. B. COVENTRY, C.E. (SANDS & Co.). EDWARDS was a farmer's son, and had an early practice in building drystone fences, i.e. without the aid of mortar. Then, having seen some masons at work, he procured suitable tools and in a short time was proficient in dressing stone. He erected some houses, mills and forges, and when he was twenty-seven he obtained the contract to design and carry out the construction of a bridge across the Taff. It was a three-arched structure, but in a couple of years it was destroyed by a flood. As he had engaged to maintain the bridge for seven years, he was compelled to erect another, and he resolved that it should be a single arch with a span of 140 feet and a rise of 35 feet. The work was not quite completed when the pressure of the haunches forced out the crown of the bridge. Then he undertook a bridge with a similar span and rise, but with cylindrical openings in the haunches. The third bridge was completed in 1755, and it still survives, although allowed to be used for foot-traffic only. There is some uncertainty about the thickness of the arch. EDWARDS declared the thickness of the arch to be 2 feet 6 inches. That was a risky depth for the arch, and perhaps it is as well the bridge has been restricted to foot-passenger traffic. He erected several other bridges and gained a local reputation. He died in 1789 at the age of seventy. Mr. COVENTRY uses the bridge for an interesting analysis of bridge statics. The days for masonry bridges are over, but still the subject is interesting, and the small book will be found useful reading by students of construction.

PAINTERS' ARCHITECTURE: CLAUDE LORRAINE.

## IRISH CROSSES.

WHEN JAMES BARRY, who was the first Professor of Painting at the Royal Academy, was a young man of twenty, he exhibited a picture in Dublin which attracted the attention of EDMUND BURKE, who became the most generous and forbearing of the artist's friends. The subject represented was the baptism of a king of Cashel by St. PATRICK. According to the legend, the saint transfixed the foot of the royal catechumen with his iron-shod crozier, who thought the act was part of his probation, and underwent it without a murmur. The event presaged many things in the ecclesiastical history of Ireland. The people were destined to suffer for their belief, although we may presume they found compensation in other ways. However zealous they were as Christians and devoted to their creed, they were evidently not endowed with extraordinary architectural skill, for all that remains of their early churches must be regarded as indicating untrained workmen. Indeed it has been maintained by some archæologists that the Irish builders were not acquainted with mortar until after the English invasion. The buildings customarily admired by visitors are later than the twelfth century.

It is not unlikely that the Norman or Welsh builders who were employed in Ireland came under local influences. There may have been native artists who could produce most elaborate illuminations and ornamentation for metalwork which was almost as delicate as filigree. In that way the carving of stone would often show a treatment that would be unlike contemporary English work. It is, however, unwise to be dogmatic about the state of art in Ireland when the country was under the sway of several kings and princes who, with all their respect for Christianity, were not scrupulous in destroying churches and monasteries and confiscating their treasures.

The group of ruins known as Monasterboice, or the monastery of BUTE, which is about four miles from Drogheda, may be taken as an example of one of the primitive ecclesiastical establishments of Ireland. It is believed to have been founded towards the close of the fifth century. It had acquired reputation as a holy place, and it was in a part of Ireland which was likely to be more civilised than the western or southern districts. But as it was near the eastern coast it was liable to invasions by northern rovers, and on one occasion there was terrible retribution. It is recorded that in the year 968 "Monasterboice and Lan Lere were plundered from the Danes by DONALL, King of Ireland, and he burned three hundred and fifty of them in one house." That was a characteristic instance of Irish vengeance. In the following century there was another attack, and we read how "the Cloictheach (viz. round tower or belfry) of Monasterboice, containing books and several other valuables, was burned." As no Danes are mentioned it is possible the devastation was perpetrated as a consequence of enmity between two neighbouring clans. When so destructive a spirit prevailed examples of art were not likely to be respected, although they might have been "instrumenta ecclesiastica." Of the most important products of Irish craftsmen, only a few have survived, and it is wiser to con-

clude that we have not sufficient materials to enable us to define all the characteristics of Celtic art.

One of the celebrities of Monasterboice was a monk named FLANN, who was a poet, antiquary and historian. In the "Annals of the Four Masters" his death is recorded in the following manner under the year 1056:—

"FLANN of the Monastery, lecturer of Monasterboice, the last fountain of knowledge of the Irish in history, poetry, eloquence and general literature, died on the fourth of the calends of December, of whom it was said:—

"Flann of the great church of sweet Buite,  
The piercing eyes of his smooth head were modest;  
The godly man of Meath was he of whom we speak;  
The last professor of the country of the three Finns was Flann."

Some of his historical poems have survived; there are also copies of a chronological work by him entitled "Synchronisms of the Irish Kings with the Eastern and Roman Emperors, and of the Christian Provincial Kings of Ireland and the Kings of Scotland of the Irish Race with the Chief Monarchs of Ireland." It is safe to assume that FLANN was only one among many scholars who were associated with Monasterboice.

It is impossible to say whether the entire ecclesiastical establishment of Monasterboice is represented by the ruins which are to be seen. There are remains of two churches; one is supposed to have belonged to the twelfth century, while the other is connected with a much earlier time. The planning of both is of the simplest—an oblong, in which was a nave and choir. There is likewise a round tower of about 110 feet in height, but originally it must have been yet more lofty, for the conical top was destroyed by lightning. Evidently it consisted of five storeys. Six feet from the ground is the doorway, which is 5 feet 6 inches by 1 foot 10 inches.

Similar buildings are to be found in other places in Ireland, such as Clonmacnoise, Glendalough, &c. But among all the Irish crosses there are none which surpass those of Monasterboice. There were three, but the principal part of the third has been destroyed.

The crosses are for want of a better term known as "high crosses," in order to distinguish them from the crosses which have been carved on horizontal tombstones. At one time they were likely to be seen near all the principal ecclesiastical establishments, but no more than forty-five of them have survived. The majority present examples of sculpture like those of Monasterboice. It is supposed that they all belong to a period between the tenth and thirteenth centuries.

They are interesting not only for their intrinsic merit, if considered separately, but also on account of their connection with more ancient art. Anyone who will look at an ancient bell shrine, like that in the Wallace Collection, a crozier, a chalice, a case for a Book of the Gospels or a brooch, will perceive that the Celtic artists always treated a subject by means of panels. There may be a resemblance between the character of the ornament, but all-over patterns are unknown in Irish decoration. Possibly the

employment of Irish diamonds in the decoration may have suggested that there could be no more interesting way of adorning the intermediate spaces than by arranging them as panels to be filled in either with a variety of ornament or by repetitions of what was found in one panel. In arranging the interlacing or the scrollwork the artists did not always observe a symmetrical arrangement. They allowed themselves liberty, and sometimes made the part on the right of an axis slightly different from that on the left. It is this variety which distinguishes original work from modern imitations. In our days repetition is considered to be indispensable. It is observed in imitations of Celtic ornament, and in consequence the work has a lifeless appearance which would horrify the old Celtic carvers and metalworkers.

When it became necessary to set up tall crosses as memorials of a prince or abbot, the artists adhered to the

the twenty-four panels have been indicated, viz. the Crucifixion, CHRIST in Glory, the Last Judgment, St. MICHAEL weighing souls, the Fall of ADAM and EVE and their Expulsion. It is well to note that archæologists are not unanimous about the meaning of the iconography, and the photographs suggest that with such figures a great deal of latitude should be permitted.

The name of MUIREADHACH might be expected to afford a clue to the time when the cross was set up. According to the Annals, an abbot of that name, who is described as the son of FLANN, died in 844, and he is presumed by some archæologists to have given the cross. But he could not have been the son of the Professor FLANN who is said to have died

CROSS AT MONASTERBOICE.

CROSS AT MONASTERBOICE (MUIREADHACH'S.)

ancient principle of panel treatment as if it alone were appropriate. Indeed, precedents in metalworking are suggested throughout. The upper part of the cross, as we see in the examples from Monasterboice, becomes a small shrine. The circle around the arms might be a copy on a large scale from a brooch. The twisted lines which enclose the panels are also familiar in the old jewellery. The panel system was likewise appropriate, for it enabled the cross to assume the character, as it were, of a pictorial bible. Owing to the defacement, it is not possible to make out all the subjects. In the taller of the two crosses we illustrate, which is 20 feet high, the subjects of nine out of twenty-two panels can be identified. They are supposed to represent the Fall of Man, Expulsion from Eden, ADAM delves and EVE spins, the Death of ABEL, the Worship of the Magi, with its type, the Three Warriors before DAVID, MICHAEL and SATAN at the weighing of souls, the Crucifixion and Last Judgment. In the second cross, which is generally known as the Cross of MUIREADHACH, because it bears an inscription asking prayers for his soul as the maker of the cross, the subjects of six of

in 1056. In 922 another abbot, called MUIREADHACH, passed away; he is described by the annalist as "chief beadsman to all the men of Bregia, youths, clerks and the steward of PATRICK's people, from Sliabh Fuaid (the Few's Mountain) to Leinster." The cross might have been produced in the time of either of these ecclesiastics.

The county of Louth contains many remains of antiquity. At the period of the invasion it was known as part of the territory of Oriel or Ulster, and having been conquered by DE COURCY it was a portion of the large region granted to him. The prehistoric archæology of Louth is represented by earthworks, stone circles, &c. Besides Monasterboice there was an abbey at Mellifont of which remains exist, there are various castles which were erected for the protection of the English, and although the county is the smallest of the thirty-two in Ireland, it presents many features to reward the artist and archæologist.

The illustrations of the two crosses are from photographs by Colonel R. W. STEWART, R.E., whose work is familiar to amateur in England, and who now derives pleasure in making records of the antiquities and scenery of Ireland.

## EARTH THE DESTROYER.\*

THERE was a time when men believed they were actually, and not in a rhetorical sense, "Lords of Creation." They looked on the earth as their creature which could be operated on in a great many ways, and dare not give any sign of discontent. SHAKESPEARE, alone among poets or seers, seems to have had a misgiving that the earth could be a source of danger. When he called it "the dungey earth" the adjective was suggestive of much which was unpoetic or unfit to be expressed in a theatre, however rude. He also realised that a considerable part of what was dangerous found its origin there, and that, in fact, some of the evil in man came from the soil on which he stood like a ruler. What can be more expressive of modern scientific theories than the address—

Common mother, thou,  
Whose womb unmeasurable, and infinite breast,  
Teems, and feeds all; whose self-same mettle,  
Whereof thy proud child, arrogant man, is puff'd,  
Engenders the black toad and adder blue,  
The gilded newt and eyeless venom'd worm,  
With all the abhorred births below crisp heaven  
Whereon Hyperion's quickening fire doth shine?

And in other passages we can see how truly he realised that man and the earth were subjected to the universal law of action and reaction. As Dr. HYDE says, "Wherever there is life we have a corresponding amount of death," and in the end the earth was the victor, for the dust of ALEXANDER might become loam and stop a beer barrel, while imperious CÆSAR turned to clay could patch a hole in a wall. Modern architects have, beyond most men, to understand that debit and credit relationship which is universal, and it is their business as far as possible to overcome the destructive power of the earth's surface. The drainage of building sites, the substitution of concrete, asphalt and other impermeable materials are all efforts to subdue the dangerous elements which are inevitable, or to keep them at a safe distance.

The series of lectures delivered at the Royal College of Physicians by Dr. POORE give an explanation of the extent of the dangers which are beneath our feet, and which, unless care is taken, can grow to be fatal to man. He therefore opens with a definition which a few years ago would be thought excessively pessimistic, but which has become no more than a truism. "That which we commonly speak of as earth, soil or humus, is," he said, "largely composed of excreta and the dead remains of animals and vegetables, which, as the result of fresh biological processes, are either returned to the bodies of living vegetable organisms, or after becoming mineralised and soluble, are washed downwards by the rain, and ultimately find an exit in the sea." Some of those organisms seem to be attracted by men, adhering to skin and clothing, clinging in the hair, and taking refuge under the nails. How numerous they are is shown by a Local Government Board report, in which it is stated that they varied from 8,326 in a virgin sand and 475,282 in a virgin peat, to 115,014,492 in the soil from a trench in a sewage farm. Broadly speaking, says Dr. POORE, in his plain manner, the microbes bear a proportion to the amount of dung, and a gramme of dung from a cow fed on hay contained 165,000,000. Tetanus, anthrax, cholera, Malta fever, plague, diphtheria, enteric and a host of diseases are all proved to be traceable to conditions of soil.

What is remarkable, that even with precautions taken to protect human life from the dangers of the soil, yet somehow noxious organisms contrive to escape from their prison. There are authorities who hold that diphtheria is a soil disease, although Dr. POORE says that is not proven:—

Newsholme's figures generally seem to show that diphtheria is now a disease more of the towns than of the rural districts. It is not very easy to understand how in a city where pavements and other impermeable coverings to the soil are general,

the bacillus is driven by the rising subsoil water into the air. Of course, it may be driven out of the sewers and sewer ventilators, in which case it becomes a sewer disease rather than a soil disease. Why is it not an air disease? Nobody who has ever smelt the air of Bond Street in a hot July, or who has watched the impurities descending from the upper air when they are driven downwards by the first showers after a drought, would refuse to allow to the air of a city any amount of potential infectivity. Most of the facts collected by Newsholme are explained as readily, if not more readily, on the theory that diphtheria is an air disease as upon the theory that it is a soil disease. If we remember that a theory is not a fact, these speculations will do no harm. Unfortunately this is not always remembered. Diphtheria (Copeman) has been supposed to show a preference for houses on damp clayey soils (Greenhow, Airy), and dampness of habitation (Thursfield). "Although," says Copeman, "dampness of site is undoubtedly a factor in the production of outbreaks of diphtheria, particularly if such dampness be due to persistent leakage from imperfect sewers or cesspools," it does not appear to bear any relation to the rise and fall of the subsoil water. That diphtheria is a soil disease is certainly not proven.

It is a disputed point how far excavations for railway and other works on a large scale produce outbreaks of malaria. The Royal Engineers, who have at times to become navvies, suffer more from fever than other troops. Excavations in Margate, before a general drainage system was adopted, used to cause much illness among the men employed. A similar experience has been derived in other English towns. PETTENKOFER was the first to maintain that enteric fever is due to a soil organism. Sir CHARLES CAMERON confirmed that conclusion by the observation of 4,000 cases of enteric fever in Dublin. He also makes a statement which is enough to overthrow a widely spread belief, for according to him, "where gravel forms the site of streets there is far more typhoid fever than in the districts which rest upon the stiff boulder clay. This is clearly owing to the fact that the bacillus typhosus, which is ærobian—that is, requires oxygen—can get it more freely in the loose gravels than in the stiff clays. In the gravel, too, there is a much greater space for the development and movement of the bacilli." It is also remarkable that Chichester, in which there was an outbreak of enteric fever in 1896, is built on a bed of gravel. Maidstone suffered in 1897 in the same way, but there the ground was contaminated by leaky sewers, drains and cesspools. It was noteworthy that the inmates of the prison and barracks escaped the contagion.

Dr. POORE, it should be remembered, is for sanitary purposes an experimentalist in agriculture, for he has kept a garden at Andover in which to test his theories. He therefore admires the system which has been followed in Holland, and especially in Groningen and Friesland, of treating refuse. In that district enteric fever is rare, and Dr. POORE asserts it is owing to the anxious care which is bestowed upon the ground. "The Dutchman," he says, "is fully impressed with the necessity of returning to the soil everything that comes out of it. Nobody knows better how to facilitate that circulation of organic matter which is a law of nature, and he sees that his profit depends upon the completeness and rapidity of that circulation, and that in farming, as in other business, a rapid turnover of capital is to be aimed at." In like manner the great endeavour of the city of Manchester to reclaim Carrington Moss and Chat Moss through the agency of refuse receives merited praise. It may not everywhere be practicable to deal with the refuse of towns and cities in so successful a manner. But Dr. POORE is of opinion that the only remedy for many of the evils of our time is by an adoption of a similar principle. We may pave the backyard, he says, and provide it with a gully, and have ventilated sewers, and yet vapours will come near our bedroom windows. The majority of sanitary experts who have to cope with the problems in crowded cities are glad when refuse is removed to a distance, regardless of what becomes of it. That kind of sanitation, according to the author, involves a systematic starvation of the soil. If his own theories were carried out the earth would be enriched, and he believes that agriculture would once more become a profitable occupation. Holding such a theory, Dr. POORE keeps a sharp watch for the defects to which sewers are liable. He gives an account of various outbreaks of illness which were caused by "the insuction of foul air or liquids by leaking water-

\* *The Earth in Relation to the Preservation and Destruction of Contagia.* Being the Milroy Lectures delivered at the Royal College of Physicians in 1899, together with other papers on sanitation. By G. V. Poore, M.D., &c., Professor of the Principles and Practice of Medicine, University College, London. (Longmans, Green & Co.)

pipes during intermissions in the supply," and when we hear of water mains being laid in the same trenches as sewers, and that a sewer has been traversed by a water-pipe, the possibilities of insuction are not rare. At Worthing in 1893 what seemed to be almost a plague was partly attributed to the accidental mixing of the Worthing water with the supply of the adjoining districts, the latter being fouled. Every water company, Dr. POORE suggests, should maintain a laboratory for chemical and bacteriological examination of the water it distributes, with efficient experts who would test samples daily or hourly.

Dr. POORE gives a description of a cottage he has had erected, which is interesting as exemplifying his principles. It consists of a living-room, three bedrooms, scullery and washhouse, glazed verandah, and, above all, a rain-water tank. It is laid out with one of the angles pointing due north in order to have a possibility of some sunshine on every wall in all seasons of the year. There is a passage or hall running from back to front, with a door at each end, so as to have a through draught. The rooms do not directly communicate with one another. Each of them has a fireplace, and no fireplace is placed against an outer wall. The walls are built of mud (that is, chalk puddled up with straw), flints and timber being the only other materials found in the locality. The mud is 15 inches thick, with rough-cast on the outside and a lining of match-boarding, so that the thickness is about 17 inches. The floors are of concrete finished in granite cement, and the skirtings are of the same material. The cost of the walls was 5s. per perch—i.e. 1 foot high, 15 inches thick and 16½ feet long. The walls do not correspond with the by-laws of the Local Government Board, but in a fire at Andover it was found that old mud walls of cottages withstood the flames. When the tendency of by-laws, says Dr. POORE, is to boycott a local building material and to extinguish a local industry, the pros and cons ought to be very carefully weighed. The rain-water tank is constructed on the principle of the Venetian cistern. It is circular in form, having a diameter of 7 feet and a depth of 10 feet. In the centre is a diaphragm perforated at the bottom by three drain-pipes. The water which falls from the roof passes through two strainers in an ornamental vase, and then through gravel and sand before it can be drawn through the pump. Lead, iron or galvanised iron have been avoided. As the roof is 1,100 square feet in area, it is assumed that the supply is 15,000 gallons a year, or more than 40 gallons per day. Other sanitary arrangements are described at length, but the total cost of this experimental cottage is not mentioned.

In planning buildings architects are not always free agents, for they are subjected to building Acts, by-laws and other edicts. Dr. POORE dare not erect his cottage without trekking across the boundary of the borough of Andover. Much of what he recommends, however desirable, could not be realised unless under exceptional circumstances. But his pages are worth consideration, for they are suggestive of the differences between natural and artificial systems, while recalling primitive and remote practice. The author's earnestness is not to be questioned, and his Milroy lectures will have their use by suggesting the sternness of the conditions of life, the difficulty of discovering nature's laws and the punishments which attend all infraction of them.

#### TEDDINGTON AND KNELLER HALL.\*

MY desire in bringing you to Twickenham to-day was to give you an insight into one of the oldest villages within twelve miles of London; there is no place which has been made more famous as the abode of eminent men and women of arts and letters than Twickenham.

Kneller Hall, formerly of the parish of Twickenham, is now allotted to Hounslow, but the hall dates back only some 100 years; it was then called Whitton House, the name given it by Godfrey Kneller, when he built it in the years 1709-11. He only lived to enjoy it some twelve years, as he died there in 1723.

The house was of red brick, stately, had good rooms and a fine staircase, which, according to the fashion of the time, was painted by Laguerre. Kneller intended to employ Sir

James Thornhill, but learning that he was engaged on a portrait of Sir Isaac Newton, said no portrait-painter should paint his house, and called in Laguerre. Lysons says Sir Godfrey Kneller painted the staircase himself, assisted by Laguerre.

Kneller, the most fortunate of portrait-painters, was a native of Lübeck. Originally destined for the Army, he was sent to Leyden to study mathematics and fortifications, but nature had destined him for a painter, and he became a pupil of Rembrandt. He came to England in 1674, whilst Lely was at the height of his reputation. By the Duke of Monmouth's desire the king sat to Kneller at the same time that Lely was painting him for the Duke of York. The young artist's success on this occasion fixed his character, and he became portrait-painter to the king, and continued his position under James II., William and Mary, Queen Anne and George I. He had painted ten monarchs, and been celebrated in verse by Dryden, Prior, Pope, Addison, Steele and Tickell. He was very wealthy, lived here in great state, was a J.P. and churchwarden of Twickenham.

As a J.P., having no distrust in his own judgment, he was apt to decide by equity rather than by law. A soldier who was brought before him, detected in the act of stealing a joint of meat, pleaded in extenuation of his offence that the exposure of the luxury was more than he could resist. The argument convinced Kneller completely. He at once discharged the wretched thief, and severely reprimanded the butcher for unduly putting temptation in the fellow's way. On a question arising as to which of two parishes a pauper belonged, Sir Godfrey would hear no evidence, but assigned him to the richer one promptly. In his great humanity he would refuse to distrain on a man who had nothing but his furniture with which to pay.

He was of inordinate vanity; he bragged more, spelt worse and painted better than any artist of his day. He was knighted by King William, and created a baronet by George I. in 1715.

He lies buried in Twickenham parish church, but his monument is in Westminster Abbey.

After the death of Kneller's widow the house was sold, and was enlarged and remodelled by a Mr. Culvert, the owner, under the superintendence of Mr. Philip Hardwick, R.A. Kneller Hall, as the house was now called, was purchased in 1847 by the Council of Education, and converted into a training school for schoolmasters of workhouse schools, the master being Dr. F. Temple, subsequently master of Rugby, and now Archbishop of Canterbury. To fit it for a training school, the house was in a measure transformed, and enlarged and re-

KNELLER HALL.

decorated by Geo. Mair, who arranged the front after the style of Wollaston Hall. In 1856 it was still further altered on being transferred to the War Department, and converted into a school for the education of bandmasters and musicians for the Army.

The Royal Military School of Music provides a thorough course of practical and theoretical instruction under a competent staff of teachers. Little is now left of Kneller's house.

On our way to Teddington we pass Pope's Villa—little like the original house when Pope resided there from 1717 until his death in 1744.

Kitty Clive's cottage was called Little Strawberry Hill; she moved here from Little Marble Hill Cottage. Kitty Clive's maiden name was Miss Raftor; she was the daughter of an Irish gentleman; she was born 1711, and died at Strawberry Hill in December 1785. In 1769, having acquired a good competence, she retired from the stage and resided at Strawberry Hill. She was married in 1732 to a Mr. George Clive, a barrister, but though the match did not turn out happily, her

\* A paper read by Mr. Arthur C. Doughty before the members of the Upper Norwood Athenæum.

character always stood unblemished. When she was asked why she did not accept the hospitality offered by some ladies of the nobility, she said she chose her company as she chose her fruit, and she was not for damaged quality.

Strawberry Hill House was originally a small tenement built in 1698 by the Earl of Bradford's coachman and let as a lodging-house. Colley Cibber was one of its first tenants. The beauty of its situation afterwards tempted persons of rank to take it as a summer residence. Talbot, Bishop of Durham, lived in it eight years; after him Henry, Marquis of Carnarvon, Lord John Philip Sackville, afterwards took the house, and then in 1747 the Earl of Oxford (then the Hon. Horace Walpole), bought the house and enlarged it during 1753 to 1776, and decorated it inside and out in the Gothic style. At some future time I hope to have the pleasure of taking you over the interior and grounds.

We now arrive at Teddington. The manor was given to Westminster by the founder Sebert, first Christian king of the East Saxons. In the year 1547 it was surrendered to Henry VIII. by the abbot and convent of Westminster. King James in 1603 granted a reversion of the manor to John Hill and his heirs.

The manor house, which stood opposite the west end of the church, was pulled down about three years ago. It was built by the celebrated Lord Buckhurst. One of the bed-chambers contained a State bed, given by the Emperor Charles VI. to Sir George Rooke.

The Earl of Leicester resided at Teddington in 1570. William Penn, the celebrated Quaker, lived there in 1688. The letter wherein he clears himself from the charge of being a Papist is dated from Teddington, October 24, 1688. John Wilkes was in hiding there, the second turning up the High Street from the church.

The parish church, dedicated to St. Mary, is a small brick structure consisting of a chancel, nave and two aisles.

The south aisle appear to have been built and the chancel repaired in the early part of the sixteenth century. The east window is much more ancient. The north aisle was added in 1753, principally at the expense of Dr. Hales, who rebuilt the tower in 1754. In the church are the monuments of Sir Orlando Bridgman, Commissioner to Charles I., and Lord Clarendon speaks of him as being in the confidence of that monarch; of Richard Parsonby, of Taunton, 1613; of William Terremant, of Whimble, Devon, 1618; of Margaret Woffington, 1760; and the celebrated Dr. Hales, who lies buried under the tower he built, was one of the vicars of Teddington, and refused a canonry of Windsor. There are also tablets to Henry Flitcroft, architect of churches of St. Giles-in-the-Fields, and St. Olave's, Tooley Street. Richard Bentley, friend of Horace Walpole, and designer of Strawberry Hill House, and Paul Whitehead, the poet and friend of the notorious Lord de Despencer, is buried in the churchyard, 1774. There is a tablet to John Walter, founder and principal proprietor of the *Times*. He had a residence at Teddington. The oldest monumental inscription is 1506, to John Goodyere and his wife.

The old church proving inadequate for the increasing population of the parish, about fifteen years ago the new church to St. Alban the Martyr, one of the finest of modern churches outside London, was built from designs of Mr. W. Niven, a then resident in the parish. In the design of the new church it was the endeavour to preserve the connection with the monastery of Westminster, to which Teddington formerly belonged.

Westminster Abbey was designed by architects who studied abroad, and by the express wish of its founder was modelled on French lines. For that reason it was determined that the new parish church should follow the general plan of French parochial churches. This meant an apse, an ambulatory, a vaulted ceiling and a far greater interior height, as compared with the width, than is usual in England.

The silver lamps came from the church of the Holy Sepulchre, Jerusalem. The centre one is made of engraved silver, and is one of a set or series which is thought to have been made in Venice, and brought thence by Crusaders or pilgrims from the west. The other six are beaten silver, and probably of Russian origin. The patriarch of Jerusalem had an inscription engraved on each of them.

In the little chapel of All Saints the reredos is a copy from Henry VII.'s Chapel at Westminster. The processional cross, the candelabra, the pulpit, stained-glass windows and many other adornments of the church are all gifts of the parishioners.

Before I conclude my paper I must express my indebtedness to my friend, Mr. Knapp, the managing director of *Surrey Comet*, Mr. Harradence and to Mr. Wm. Rice for their kind assistance in the preparation of my paper.

The illustration of Kneller Hall is from a photograph by Mr. Charles Wheeler.

**A Chapel** is to be erected in the grounds of the Royal Military Academy, Woolwich, for the use of the cadets, at a cost of 6,000l.

## TESSERÆ.

### Stothard's Early Career.

STOTHARD was bound for seven years to a master living in Spital Square as a draughtsman of patterns for brocaded silks, then much in fashion. About two years before the expiration of his indentures flowered silks lost their vogue and the business of his master became slack. Having time on his hands, Stothard amused himself with making designs for Homer's "Iliad," Spenser's "Faery Queen" and other books he got into his possession. The master soon after died and the rest of the time he served with the widow, who also encouraged his taste for historical drawing. With some of his sketches she adorned her parlour mantelpiece, and these accidentally were the means of determining Stothard's future career. Two gentlemen calling one day on business, one of them was struck with the drawings, and on being told they were by a young apprentice, asked to see him. The stranger was Mr. Harrison, editor and proprietor of the *Novelist's Magazine* and the same who availed himself of Turner's early drawings. Taking a book from his pocket, he asked Stothard to read it and to make a design from any passage which most struck him. On calling at the time appointed, Mr. Harrison found three sketches ready, which he approved, and the young artist got his first fee of half a guinea. At the end of his apprenticeship Stothard's mother was living at Bethnal Green, where he went to reside with her and added to his little income by painting small family portraits among the neighbours. In 1778 he went to Portsmouth to visit Darcey, a fellow-artist, with whom he had become acquainted in London. Here he first resolved to follow painting as his profession; and returning to London, took lodgings in the Strand with another friend, Shelly, afterwards of some eminence as a miniature painter. His connection with the *Novelist's Magazine* became more fixed, and in a memorandum among his papers it appears that he made for that work 148 designs at one guinea each. For twenty-six designs for the *Poetical Magazine* he had the same rate of payment. For twenty theatrical frontispiece portraits he received 7s. each, and for various borders and vignettes, 6s. Such was then his humble work and moderate payment. It was about this time that he painted his first picture, "A Holy Family," for the Society of Artists, and soon after was admitted as a student at Maiden Lane, where, before the establishment of the Academy at Somerset House, the artists occupied temporary apartments.

### Chambers's "Treatise."

The buildings of Chambers have been censured for their multitude of little parts, and his "Treatise on Architecture" has something of the same fault. It is broken into no less than twenty-six portions, but such minuteness of division was in so far necessary, to the end that individual parts might be viewed and considered by themselves. We must never forget, however, that a door-piece, or chimney, or stair, however elegant in itself, must fit its place and harmonise as a member in the mansion, before it can be pronounced beautiful. The following is the order of arrangement of this memorable treatise:—(1) Origin and progress of building; (2) Parts which compose the orders of architecture, and of their properties, application and enrichments; (3) The orders of Architecture in general; (4) The Tuscan order; (5) The Doric order; (6) The Ionic order; (7) The Composite order; (8) The Corinthian order; (9) Of pilasters; (10) Of Persians and caryatides; (11) Of pedestals; (12) Of the application of the orders of architecture; (13) Of intercolumniations; (14) Of arcades and arches; (15) Of orders above orders; (16) Of basements and attics; (17) Of pediments; (18) Of balustrades; (19) Of gates, doors and piers; (20) Of windows; (21) Of niches and statues; (22) Of chimney-pieces; (23) Of profiles for doors, windows, niches, chimneys, &c.; (24) Of block cornices and extraneous entablatures; (25) Of the proportions of rooms; (26) Of ceilings. To these were added an introduction concerning the natural genius and acquirements necessary for an architect, designs for casines, temples, gates and doors, and an explanation of the principal terms employed in the science of architecture; the whole accompanied by such illustrations as the author supposed his text to require. Chambers seems neither to have wanted knowledge nor to have spared consideration and research to render his work worthy of public approbation. Here we have the progress of architecture traced from the wigwam to the palace, and may read in a sequence of examples how rudeness grew into beauty and coarse strength into splendour and magnificence.

### Correggio.

To express divinity distinctly, and apart from earth, was for a long time the aim of religious art. Raphael and Correggio were the first great masters who strove to humanise the Virgin and her Son so as to give the tenderness of the mother and the innocence of childhood in one group, in which the Divine element should be secondary to the sanctity of those affections which cling closest to the heart of humanity. They

sought to unite the loveliest human forms with its tenderest expressions. Raphael alone triumphed, and gave to the world those holy families which in motive and grace of feeling are unrivalled in art. Correggio's genius was not equal to so lofty a flight. He was undoubtedly great in his manner and clever in the subtleties of painting, but he has left nothing that touches the heart, if, indeed, he may be said to have escaped affectation. There is no painter, considering his reputation, who disappoints the spirit so much. In repeated instances he sinks into downright insipidity or sensuality. There is nothing divine about his holy women. Their beauty is solely of the skin. No one need fear to make love to them. His children have nothing attractive in feeling. Considered with the French school, Correggio is, indeed, pure, but compared with his contemporaries he made a sad inroad upon sacred art. In painting Correggio is artificial, and in spirit superficial. Those cloud forms in the dome of the Parma Cathedral are, however, wonderfully transparent, and let the eye into the abyss of heaven. He is most at home in the nude and classical, as may be seen in that sunny picture in the Louvre. The flesh is bad. It has not the quality of healthful skin, but looks tainted. On no subject in art is there more diversity of opinion than in colour. Some individuals cannot distinguish one colour from another; others call the same hue by different names. A blind man, through feeling, is perhaps a better judge than many with full eyesight. By some Correggio is considered a good colourist. His rainbow tints have, however, a tricky, flashy look, unworthy of high art, and savouring more of its legerdemain. There is no reality in them. They seem altogether evanescent. Like the toilette of a charming woman, they are used more for their own sake than for the subject.

### The Temple of Selinunte.

The gigantic ruins of Selinunte are probably the most astounding exhibition of human power that was ever witnessed. Amazement tintured with some degree of incredulity is, perhaps, the first impression which these stupendous ruins create. Can these ponderous masses of rock have ever been erected to their former accredited altitude of more than 60 feet by human hands? A large portion of one column and a lesser one of another are all that are erect, the rest are tumbled about block over block, the evident work of an earthquake; and what power less than that of an earthquake also could the architect have had at his command when he erected the vast edifice? It is said to have been built by a colony from Megara, under Pamilio, in the thirty-fifth Olympiad, and that it was destroyed by Hannibal not long afterwards. The city was nearly destroyed a second time and remained in that state until the ninth century, when the Saracens completed the work of devastation as far as they could. The mother country displays no such colossal relics. Here, indeed, the tourist will feel that he is one of the degenerate race of beings that old Homer speaks of. A nation of Ajaxes must have been selected to build the temple, and nothing less than an Archimedes could have conceived the practicability of its execution—the bold mechanician who boasted that he could move the globe if he had a fulcrum for his lever. There are two other temples of inferior magnitude. Altogether they form a most exciting exhibition. Breval, writing in 1738, says of them:—"I measured one entire piece of a broken entablature about 18 feet long and 24 feet thick. I took notice likewise of a kind of monumental, but quite unornamented piece of granite-like marble, that stood by itself in the midst of an adjoining field, which exceeded a double cube of 20 feet. The ruins of its amazing temples and other public structures are a demonstration, beyond any other that Europe affords, how far the ancients exceeded the moderns, not only in a great taste of architecture, but likewise in their skill in mechanics, by raising to such a height such unwieldy and ponderous bodies."

### Rembrandt and Spinoza.

Amsterdam, Spinoza's birthplace, is fitly called the Venice of the North, and it may be that the marvellous colour which appears in the Netherlander and Venetian paintings came from contrast with nature, the contrast which makes the eye, by some physiological necessity, see inwardly the opposite of what it is looked upon, and thus makes the flaming sunset suggest the tranquil blue of the sea, and the ruddy dawn prepare the eye for the quiet green of the meadows. It is certainly worthy of note that painting has so thriven in low countries, so rich by nature in colour and scenery, as Venice and the Netherlands; and that the Van Eycks, who were virtually the founders of oil-painting, and the great masters of colour, Rubens and Vandyke, were Netherlanders, and Titian and Tintoretto, the great colourists of Italy, were Venetians. Rembrandt, indeed, rebelled against the power of colour, and owned only a law of light and shade; and Spinoza, his contemporary and countryman, followed him by discarding all colour from his style; yet both magnify the element which they discarded by the gloom of its absence. Rembrandt's pictures and Spinoza's

writings make us long for rich fields and bright flowers, gay birds, playful children, ruddy men and fair women. Spinoza learned to draw, but we have no specimens of his work; and there is little reason to suppose that he had more colour in his pencil than his pen, which not only gives no colour to its pages, but does not report any from nature and life, and presents even the rainbow, not in its prismatic beauty, but in its mathematical law.

### St. Margaret's, Westminster.

No truth is more certain than that the surest way to dwarf a really large building is to remove from it all standards by which its size may be estimated, and plant it alone with a free space all round it. We all know how much smaller St. Peter's appears than St. Paul's from this very cause. The magnificent piazza in which it stands, and the accurate proportion of its colonnades and other adjuncts, all tend to bring down its size and diminish its effect. Now, at Westminster, St. Margaret's just supplies what St. Peter's at Rome wants. We see a very large building with a lofty tower dwarfed into insignificance by the side of the Abbey, and we almost unconsciously grasp the dimensions of the building, and have a feeling of its magnitude which would be lost if this standard were removed. We may add that St. Margaret's has become more than ever essential now that the Palace of Westminster, with its lofty towers, has been erected in such close proximity to the Abbey. The dignity of the older building suffers grievously in all distant views from its aspiring neighbour. Remove St. Margaret's and the nearer view would almost equally suffer.

### Architecture, Sculpture and Painting.

The treasures of sculpture which England possesses are undoubtedly the Elgin Marbles. Yet what were they but subordinate to the building which they adorned? The sculptor limited and compressed his superb metopes to fit into architectural spaces designed and commanded by the architect, and lengthened his frieze (by, to him perhaps, tedious repetition) to the measures and proportions prescribed to him. But, more wonderfully still, the sublime artist shaped and bent and cut off portions of his splendid figures, though finished, as carefully on the shoulders as on the chest, and even where the projecting cornice must have hidden their beauties, so as to fit and adapt them to the slopes of the tympanum, till they diminished to the emerging heads of Aurora's steeds—heads that make us fancy he must almost have felt indignant at not being allowed room for equally matchless bodies. But how could such an artist have lent himself to the adornment, or rather the work, of such a building, unless he had felt it to be worthy of him? How could his genius have bowed and adapted itself to any but a kindred and avowedly equal one? It was necessary, indeed, that architecture, in its artistic character, as capable of satisfying and gratifying the eye, should have been on a level with sculpture, to have so secured its confidence, co-operation and almost subordination through the very masterpieces of its skill. And the same must be said of painting. With few and not perfectly successful exceptions, we are content with easel paintings to hang upon the walls of private houses or even of galleries. The latter, indeed, as public buildings ought to give ample scope to architecture, and at Florence or Munich they have done so. But in most countries chance buildings have been adopted or adapted to give a home to pictorial art. Yet painting on a great scale, and for public instruction, requires great wall-spaces, expressly provided for it by the architect.

### Religious Art.

In all countries and under all creeds the law under which an earnest and true art has been developed appears to have been similar. Thus, in Egypt we find no essential difference between the palaces, the temples and the tombs; the same art, in architecture, sculpture and painting, encircled the people at their feasts, their festivals and their funerals. So it was in Assyria and Greece. Religious art drew vitality from the life of the people; noblest form and action in grove or temple was modelled in the clay, and the people who walked the streets of Athens found, through sculpture, apotheosis on the pediments of the Parthenon. Even hostile religions may come into accord through art. St. Paul, while standing on Mars Hill, could see the figures of Phidias as they looked down from the Acropolis; and now these marbles from Minerva's Temple, and the cartoon of the apostle preaching to the people of Athens, brought almost side by side in the same metropolis, seem to show that art, when noble and true, is almost of necessity religious. A spirit solemn and silent presides over the Elgin Marbles, and many minds will feel that the Theseus of Phidias has at least equal religion with Thorvaldsen's figure of Christ. The platitude then may be once more permitted, that the condition for the birth of every religious school, whether Classic, Mediæval or modern, seems always the same; the religion and the art must hold closely together, must be knit compactly as in unity of organic life, and, above all, must not be bound down to obsolete tradition and vague abstraction.

## NOTES AND COMMENTS.

AN inquiry has been made by Mr. T. MYDDELTON SHALCROSS about the practice of eighteen or twenty of the principal fire insurance companies in respect to the payment of architect's fees. He has ascertained that some of the fire insurance companies refuse to pay architect's fees incurred in the reinstatement of fire damage, notwithstanding that premium has been paid upon architect's fees, originally incurred, as part of the cost of the building insured; that other fire insurance companies only pay such fees in cases where they have been separately mentioned and described in the policy; and, again, that other fire insurance companies always pay such fees whether or not they are separately described in the policy. Those who think they are insured against fire would do well, therefore, says Mr. MYDDELTON SHALCROSS, to inquire from their assurers how the matter stands in their own particular cases, as otherwise, should a fire occur, they may find themselves uncovered to the amount of several hundreds of pounds in respect of their premises. For example, in the case of a building costing, say, 10,500*l.*, including architect's fees, and totally destroyed, the owner might find himself only able to recover 10,000*l.*, and have to bear the loss himself of the remaining 500*l.*, or, in the alternative, have to be satisfied with an inferior class of work in the reinstatement of the premises, *i.e.* work performed at the will of a builder without the direction and control of an architect, and there would, of course, be a similar result in case of a partial destruction of the premises *pro rata*. The malpractice is one of those which are endured by the sufferers rather than have it announced that their services were not appreciated and could be dispensed with. It is false pride which in such cases conceals unfair treatment. The insurance companies have no more right to withhold an architect's fees than to refuse to pay the contractor a profit on the rebuilding of the premises.

THERE must be something inherent in Liverpool which is opposed to the erection of a cathedral. When in the first half of the nineteenth century a project was announced, the outcry against it was so strong the promoters shrank from further attempts. The effort which was made a few years ago also came to nothing. The latest endeavour to accomplish the work has been met with an amount of opposition which we might say is characteristic only of Liverpool. The cathedral committee altered the conditions of the competition in the expectation of turning adversaries into friends, but to no purpose. The report of the advisory architects was one of unquestionable impartiality, and yet we find that the conclusions have been impugned. It is objected that only 103 architects entered into the first competition. But as the majority of the competitors are natives of this country, the number is not less than what was to be expected. There is cavilling at the fees paid to the advisory architects, which are no doubt two-thirds of the fees which will be received by the five competitors, but all architects who took part in the first competition were aware of the amount of the reward which awaited them if they succeeded in the first stage. It is also announced, as if with satisfaction, that the subscriptions reach no more than 154,114*l.* 16*s.* 3*d.* But when objections were raised and expressed in the most confident manner it was not to be expected that the class of people who usually contribute towards the erection of churches could escape from doubts about the character of the work which they were desirous of aiding. Even in the latest criticism it will be seen that a direct appeal is made to subscribers, for the last words of the document are:—"A dead site and a dead style seem to be the ideals of the executive committee, but the petition committee have confidence that the public, by withholding their subscriptions from the present cathedral scheme, will prevent ideals so lifeless being attained upon their behalf."

## ILLUSTRATIONS.

LOMBARD STREET, SHOWING BANKERS' SIGNS.

IN a time like the present, when trusts are created almost daily and companies are formed without much deliberation, it is becoming customary for traders who have some claim on antiquity to demonstrate their difference

from the new class who expect to thrive without having a history. The recent introduction of signs in Lombard Street has not on that account received any censure from those who are opposed to projections in general. It was remembered that bankers at one time made themselves known by means of signs. Some of those symbols were preserved, others are known by drawings and engravings. What we see in Lombard Street cannot therefore be looked upon as new inventions, for every one of the subjects can be justified by records which are valuable as evidence.

The City of London unquestionably lost many signs at the time of the Great Fire. Imitations of them were afterwards set up. But both ancient and later examples had to vanish in obedience to the Act of 1762. It was fatal to painted signs especially. Sculptured signs were interpreted to be part of the structure of the building to which they were attached, for English law is generally in favour of anything which relates to property, however remotely. In the Guildhall Museum some of those old examples may be seen.

Signs must have had their origin in the desire of all traders to make their places of business easily identified, so as not to be confounded with rival establishments. In Pompeii signs of many kinds existed, but archæologists of a confiding tendency have traced those objects to the time of ALEXANDER THE GREAT. The sun and moon are supposed to be a survival of pagan worship. La Belle Sauvage has been identified not only with Captain JOHN SMITH's lady-love but with SOLOMON'S Queen of SHEBA. Outside Turkey there is probably no city of Europe of old date from which signs were absent. In Paris they were likely to be as numerous as in Amsterdam.

It cannot be said that signs are a necessity in our day, for there is a variety of means by which to indicate commercial premises. They may be pardoned in Lombard Street as a means of suggesting banks which are old creations, and in such cases the artistic quality of the signs need not be considered. Yet in a thoroughfare like Lombard Street, where the Italian style prevails, projecting signboards seem less in keeping with their surroundings than in a street of half-timbered buildings or where other old-fashioned forms of architecture abound. The only signs enduring in a modern street would be those which could be esteemed as veritable works of art. M. DETAILLE has been endeavouring to have signs of that class produced by Parisian painters, and several artists who have gained reputation have co-operated in realising his project. The forthcoming exhibition will no doubt display works less simple than those now hanging in the centre of the City, and of which the significance is not always apparent. In Lombard Street the signs have unquestionably altered the character of the street, and some people may wish to have the example imitated elsewhere. It is only, however, when signs are unquestioned proofs of artistic power and remarkable for beauty that they should be allowed to interfere with architectural lines which were designed without any thought for such projections.

CATHEDRAL SERIES.—HEREFORD: THE CHOIR SCREEN.

IN 1717 the east end of the choir of Hereford Cathedral was partly concealed by a Classic screen which had been set up two years previously. It would not be easy to have anything more incongruous in a Mediæval building. A window above it, which lighted the choir, was filled in with a representation of the Last Supper, copied from a picture by BENJAMIN WEST, P.R.A. In 1841 Bishop MUSGRAVE called attention to the ruinous condition of the cathedral, and he was enabled to undertake a restoration which was confided to LEWIS COTTINGHAM, who remained in charge of the operations until his death in 1847. The screen was removed, as well as the Perpendicular window which had been introduced by some "improver," subsequently to the Perpendicular period. Many surprises awaited the restorers. The central pier was one of them, but the upper part, which is covered with painted decoration, is modern work. The reredos was erected in 1850, and was intended to be a memorial of JOSEPH BAILEY, who had been member for the county.

## THE ARCHITECTURAL ASSOCIATION.

THE annual general meeting of the Association was held on Friday evening last in the rooms of the Royal Institute of British Architects, 9 Conduit Street, W., Mr. H. T. Hare, president, in the chair.

A vote of thanks was passed to the Royal Institute of British Architects for the eleventh annual grant of 100*l.* towards the education scheme of the Association, and a second vote of thanks was passed to Mr. H. Wilson for presenting a portfolio containing drawings, designs and sketches by the late Mr. John Sedding.

Messrs. A. Bough, C. J. Graham and J. R. Sanders were elected members. The list of nominations for membership to be elected at the next meeting contained fifty-five names.

A vote of thanks was passed to the Bath Stone Firms for their hospitality and kindness on the occasion of the visit of the Association to their Portland quarries.

The President distributed the prizes gained in the examinations. The following were the awards:—

A. A. travelling studentship, value 25*l.*, and silver medal, L. G. Detmar; second prize, value 5*l.*, G. S. Nicol. Banister Fletcher bursary, value 25 guineas, and medal, A. E. Richardson.

*Lectures. Division I.*

W. A. Hodges, A. A. scholarship, value 4*l.* 4*s.*

*Studio. Division I.*

J. F. Schneider, drawings of old work, prize value 10*s.* 6*d.*; H. L. Samson, study of ornament, prize value 10*s.* 6*d.*; H. L. Samson, construction, prize value 10*s.* 6*d.*

*Studio. Division II.*

I. S. Davies, design, prize value 10*s.* 6*d.*; A. E. Bullock, time sketches, prize value 10*s.* 6*d.*; A. E. Bullock, study of ornament, prize value 10*s.* 6*d.*; A. E. Bullock, construction, prize value 10*s.* 6*d.*; H. L. Samson, perspective, prize value 10*s.* 6*d.*

## ORDER OF MERIT.

*Lectures. Division I.*

Greek and Roman Orders.—1. E. G. Stevenson, book prize; 2. J. T. Sifton, 3. C. R. Pinsent. Elementary Construction.—1. W. A. Hodges, book prize; 2. H. F. Murrell, 3. H. D. Aubrey. English Architecture.—1. C. J. Goodwin, book prize; 2. H. F. Murrell, 3. H. J. Wyeth. Mediæval and Renaissance.—1. W. A. Hodges, book prize; 2. H. F. Murrell, 3. C. J. Goodwin. Elementary Physics, Formulae and Calculations.—1. R. E. Stewardson, book prize; 2. W. A. Hodges, 3. T. W. Watkins. Plane and Solid Geometry.—1. S. T. Hennell, book prize; 2. C. R. Pinsent, 3. H. R. Greig.

*Lectures. Division II.*

Materials, their Nature and Application.—1. R. J. Tyndall, book prize; 2. G. Church, 3. B. B. Hooper. Construction.—1. G. Church, book prize; 2. C. M. Crickmer, 3. A. Wood. Drainage and Water Supply.—1. D. Anderson, book prize; 2. B. B. Hooper, 3. B. Greig, A. Potter, 4. G. M. Page. Ventilation, Lighting and Heating.—1. G. M. Page, book prize; 2. D. Anderson, 3. B. Drummond. Professional Practice.—1. B. Greig, 2. B. Drummond, 3. W. J. Davies. Mensuration, Land Surveying and Levelling.—1. D. Anderson, book prize; 2. H. J. Rippon, 3. W. H. Baines.

*Elementary Class of Design.*

Prize, value 3*l.* 3*s.*, and bronze medal, H. Samson; certificates, E. G. Stevenson, H. Hyams.

*Advanced Class of Design.*

Prize, value 5*l.* 5*s.*, bronze medal and pass for modelling class, E. Gunn; certificate and pass for modelling class, E. G. Theakston; pass for modelling class, L. Lee, A. G. Scott, J. N. R. Vining.

## The President's Address.

Fellow-members and Students of the Architectural Association.—The first official duty your President is called upon to perform, that of addressing you at the opening of the session, is probably the most difficult and onerous of the many tasks which fall to his lot during his term of office. Time-honoured precedent, however, makes it impossible for him to avoid the duty, however much he might desire to do so, and it is a privilege not to be lightly set on one side. I therefore take up the burden, not so much in the hope that I may be able to say anything which has not been often and better said by my predecessors in the chair, but rather that I may give the necessary opening to what promises to be one of the most successful and important sessions which the Association has seen. What diffidence I may feel is dispelled by the testimony of your presence here to-night, which witnesses to the fact that this annual address is no mere formality. The responsibility, however, increases yearly, and expands as the work grows, and our interest in an engaging and delightful calling makes it well

that we should thus annually meet to take stock, as it were, of our position; to review not only the past year, but the years which have gone beyond recall; to see how we stand, to look ahead into the future years, with whatever they may bring us; and, while taking counsel with each other, to encourage ourselves for the great and far-reaching object we have in hand, viz. the advancement of architecture, both as an art and a science.

About fifty-five years ago the Architectural Association, which was then in formation, met in a coffee-house; afterwards in Lyons Inn Hall. The same burning zeal which inspired the founders is, I truly believe, still with us; the flame has in no way become dim; some of the founders are even still with us to-day, among them the venerable and esteemed Professor Kerr. From then till now is over an average lifetime, and the Association is now a full-grown and vigorous body, meeting, by the courtesy of the Royal Institute of British Architects, in this their meeting-room, our proceedings fully reported in an admirable professional press, and possessing a representative journal of its own production, not devoid, I venture to think, of literary merit. We cordially welcome here to-night many old friends, while a still vaster number continue on our rolls, whose sympathy and support are essential to our well-being and progress. Their sons and successors are with us, working with a full and free hand, while, it may be, their grandsons are now in the Student Corps which our roll encloses. The Architectural Association is truly vernal. If you would renew your youth I know of nothing likely to be so invigorating and stimulating as your attendance at one of our annual gatherings. The labours of the Association have ever been of a self-denying character. In early days, and until within quite recent years, when the new educational movement was inaugurated by my distinguished predecessor in this chair, Leonard Stokes, the work of the Association was carried on by mutual self-help of an entirely honorary character. The services thus rendered gratuitously were of a high and valuable order, and many of us here to-night gratefully acknowledge our deep indebtedness for the valuable instruction thus imparted. But what was suitable for that time is wholly inadequate for to-day. Not that the conditions have so changed that we can dispense with the information of the past; but modern requirements are so exacting, and technical facilities offered by public bodies so great, that it became essential, not only to bring our curriculum into line with those institutions, but to place the Association in such a position as to be able to be the head and fountain of architectural education in London.

The establishing of the studio and the renting of the present premises in Great Marlborough Street was an enterprise viewed with fear and misgiving by many members. Those who pressed forward the scheme, fully believing it to be urgently necessary to meet the requirements of the time, may now, however, congratulate themselves on the success which has resulted, and on the benefits which the profession generally has derived from the facilities for study which have been afforded. Those who have passed through this course of training are only too ready to testify to the practical nature of the instruction they have received, and there is every reason to believe that the success of the past will be more than maintained in the future. The general principle of the old classes of design is still maintained, in that the instruction or criticism is of a voluntary nature, conducted by a body of visitors specially invited, whose instruction is of the greatest value and advantage to the students attending the school of design. We are glad that this old and well-proved system still continues, and with such excellent results, in our Association work. We have not yet embarked upon the actual teaching of design in principle and practice, but that this must form a definite item in our programme of the future is not difficult to foresee.

I am happy in having the privilege of recording the most successful result of the first year's work of our newly established day school, which is now in a flourishing and vigorous infancy. The formation of this involved a vast amount of time and thought on the part of my immediate predecessor in the chair, and its successful inauguration must be very gratifying to him. We have been most fortunate in securing as the master Mr. Arthur Bolton, to commence and complete the first year's course. To inspire enthusiasm into the new students, and to fully satisfy the intentions of a committee who were keeping their eyes upon the future of the school, must have taxed the best and most genial of men. Everything has dovetailed in a most admirable way, and the success of the first and somewhat experimental year augurs well for its long and growing influence. The year's work has, however, demonstrated beyond all possibility of doubt the absolute necessity for other and more suitable premises. It needs no little skilful negotiation in our now very confined limits to make everything work with the smoothness so necessary in an educational institution. How difficult this is may be judged from the fact that the day school hours are from 9.45 to 5 and the evening school from 6.30 to 10. It is unnecessary for me to reiterate what has been stated so often from this chair, that the committee are still on the

look out for premises. I ask however for patience, fully expecting to be shortly able to make an announcement which, while fully meeting all our needs, will be gratifying to a degree to our members.

The object of the Architectural Association is to teach—in a measure—architecture, while its lofty aim is the improvement of the art. I do not by this mean to infer that it is possible for us to outshine the brilliancy of the work of the ancients, or of the masters of the Gothic or Renaissance periods. Our object is not to revive this or that period, but rather by the study, contemplation and comparison of that which has gone before us in all that is noble, beautiful and pure, to acquire those principles of proportion, those refinements and elegancies of form and detail which have been the constant admiration of mankind in all ages. By such reflective study we seek to originate an inspiration which will subserve itself to the utilitarian requirements which our day and generation demand from us as architects, form being subservient to purpose, and use put into effect may be so suitably and constructively dressed as to commend its result not only to those who employ us, but to all intelligent and thinking observers of the beautiful and suitable in the greatest of the constructive arts. We feel that the deeper, the wider and the more analytical our study of the work of the past, the better shall we be equipped for the production of original work and the less likely shall we be to fall into the dry and uninteresting groove of the mere copyist. We desire no "new art," casting aside in a moment the traditions of the past, but a steady and rational development on a sure and solid foundation; the same process of development which has produced everything in art which has been lasting and worthy of admiration. Our ideal is no doubt a very high one, and in order to achieve it so far as lies in our power, we have collected for the guidance and instruction of our students (if I may quote from a recent address) "Brains, similar to the collecting of rare books or works of art." In our instructors we have a body of gentlemen of attainments which our predecessors in this Association would have envied. The requirements of the fully-qualified architect cover so wide a range of knowledge and true education is so lacking in most of us, that many are prevented from attaining the best results. We endeavour to bring the average man, who comes to us with his mental capacities trained at a good school, in contact with the best brain power the profession can offer him, and this before bad professional mental habits are formed, which eventually would lead him to wander illogically from pencil to paper, and thence into practical being in a building, which, unlike a picture, cannot be painted out or hidden away from the gaze of mankind. I am not afraid to assert that architecture in this country is cursed by ignorant mental habits which a simple and well-defined system of education would have rendered impossible. Even the genius (there are such, and we are glad to have them, though their percentage is small to the generality of men) may profit in no small degree by the training and knowledge we have to offer him. But it is to the average, not the exceptional, man that I wish more especially to address myself. An employer seeks the services of an architect in his necessity; that man usually is the average man. Generally speaking, it is the all-round man of good average ability who, by dint of long, patient and persistent study, is he who makes the most successful and valued practitioner. Speaking the other day of another profession the President of the British Association said:—"It was in the abundance of ordinary plodding ability, thoroughly trained and methodically directed, that Germany at present has so commanding an advantage." These weighty words abundantly express what it is the object of our Association to provide, and what, I sincerely trust, it is the whole-hearted aim of our students to acquire.

We have no new style to invent. It would be as sensible to invent a new language for the British nation. But as we read Shakespeare, Milton and Addison, or study the elegancies in diction of Lamb, Burke or Bright in writing and speaking in beautiful language, so our endeavours should be to graft upon the construction of our designs such sympathetic qualities as shall form a perfect marriage between the beauty and form of the architectural outlines and the practical necessities and objects of our buildings. Our educational work is not to cram for an examination; far from it. The examinations of the Royal Institute of British Architects do indeed test our work, but are a means, not the end, we have in view. It is to be regretted that crammers do exist. I again quote Professor Dewar's brilliant address, which is singularly applicable to us as architects:—"There are," said he, "plenty of chemists turned out now by our universities, but they are of no use for practical purposes. They are chockful of formulæ. They can recite theories and they know text-books by heart. But put them to solve a new problem freshly arisen in the laboratory, and it will be found that their learning is all dead. It has not become a vital part of their equipment, and they are 'floored' by the first emergence of the unexpected." Now the end of all this is to show that our desire is to make our students learn to think "as a vital part of their mental equipment."

Much has been said, and much more no doubt will be said, on the much-vexed subject of architectural competitions, and I do not wish to enter upon a discussion of the question from its more controversial points of view. I am amongst those, however, who do not regard them as an evil to be fought against, and eventually if possible abolished. The fact that they provide the young and obscure architect with his opportunity seems to me to be sufficient to justify the principle without seeking further for reasons. Almost every argument which has been urged against them has not been so much against the system as against the abuses which have occurred in their conduct; these are undoubtedly preventable, and the remedy lies entirely in the hands of the profession. It is, however, of the educational aspect of competitions that I wish to speak. I know of no better means by which a young architect can acquire knowledge and experience in design than by taking part in a competition for a definite building for an actual site; in no other way can he so well attack the practical, as well as the æsthetic problems, and in no other way can he have an opportunity of comparing his efforts with those of more experienced and practised architects. If, however, he is really to profit by such experience his design must be a serious effort, carefully studied and restudied until it appears to its author to be as perfect as he can make it, until he can conceive no possible objection or fault which is capable of remedy. The brilliant idea, the flash of genius, dashed off in half an hour, never did and never will succeed in a competition. And withal, the young competitor (and I might also add the old one) must always cultivate the habit of self-criticism, and must be always prepared and even anxious to admit his inferiority. He must always have in mind that his task is not merely to find a solution of the problem in hand, but the best possible solution. This, of course, should be the object in all design, competition or no competition, but I fear it is so in comparatively few cases, judging by the work we see around us every day. The principle of competition should give the necessary incentive for the effort required. It is, of course, essential that the conduct of competitions should be beyond all question, and that every possible means should be adopted in the selection to secure the choice of the best design submitted. Matters have greatly improved in this respect of late years, but much still remains to be done. The profession can, if they will, compel promoters to conduct competitions in a satisfactory manner, and all those who are working for this end should have the support of every architect in their endeavours.

Much as architects have to deplore the ignorance and apathy of the public towards their art, I believe there is slowly, but none the less surely, developing a movement towards a better appreciation of architecture. The building public are, I truly think, growing anxious to have real architecture, and are willing to pay for it if they can get it. It is our business to give it them, so far as lies in our power. Public bodies are becoming very keen to have buildings of which they can be proud, and which are not designed merely to serve their utilitarian purpose. One sees occasionally an architectural article in the daily press, evincing nearly always, it is true, an ignorance of the subject positively appalling, but still showing that there must be a desire on the part of the public for information. It is much to be regretted that these articles when they appear are so often incorrect and misleading. We, as architects, may, I think, do much to educate the public in these matters.

Without apology to our seniors, I now wish to address myself more particularly to our younger colleagues, and especially to those members of our day school, whom we are glad to cordially welcome within our ranks. You have entered one of the most fascinating and noble of professions it is possible to select, and with diligence and devotion to your studies you will find your work provide you with many recreations. Art is long, and life at the best short, and you will find much to interest and delight you throughout your career. It is not given to everyone to be a genius born; indeed, it is well that it is not so, inasmuch as many such are impractical and visionary dreamers in a matter of fact world. Your ultimate aim is to become a refined and capable practising architect, and with this in view you will do well to organise your studies into a system which for reference will stand you in good service in after years. Reflect upon what I have said as to the cultivation of the mental habit. Analyse the reason and basis of everything. It is not enough to sketch and draw. You must inquire and investigate as to why this is beautiful, and why that is unlovely. Above all, I would have you not regard your profession as merely a means of livelihood. That, of course, is a necessity, but if you are to excel it must be your recreation, and, indeed, your life. The real and sweetest reward of your labour will always be the appreciation of your fellow-workers, who know so well the difficulties you have had to meet, and can estimate the measure of your success. It is all-important that you should be capable draughtsmen. I do not by this wish to convey the idea that

draughtsmanship is architecture; far from it, it is often the reverse; but by draughtsmanship an architect is able to record his conceptions and to dissect his ideas. A well-known professor of architecture at the Royal Academy, in urging precision, advised his hearers to throw away their india-rubber. I advise you to do the reverse. Do not be afraid of that invaluable means of erasure. Rub in and rub out until you have secured what you believe to be right. Above all things do not work upon an empty head. You might as well work upon an empty stomach and expect to have physical energy and activity. But first feed your mind with examples, reflect upon and analyse these, whether from illustrations or your own recorded sketches. Then put these on one side and conceive what is suitable to the position and character of the subject in hand. You may be only the average man, but by persistent study and patient endeavour, precept upon precept, line upon line, here a little and there a little, you will be able to build up a reserve of information which will be of great and lasting value. Anyway, there is no room in the profession for the lazy man—I hope he is not here to-night—as the rewards which diligence brings have to be sought with love and labour. Your profession calls for some self-denial; it would not be worth much if it did not do so. Perhaps some expenditure of midnight oil may be necessary, but this will not be detrimental if exercised with wisdom and moderation.

The priceless collections in our museums await your inspection and study, together with an appreciative knowledge of the best works of painting, sculpture and the allied arts, both ancient and modern. The same may be said of the ancient buildings of London and the neighbourhood. The best works of modern architects seem to me to be a fruitful and helpful study which is not fully taken advantage of by our students. Our spring and summer visits, so admirably organised, will afford you facilities for going further afield.

It has, I fear, become somewhat the custom to decry the particular value of sketching and measuring, while the standard of draughtsmanship has advanced by leaps and bounds. In recent years it would appear that the healthy habit of sketching is not so universal as it was twenty years ago. I commend it most earnestly to your careful attention. Nothing that I can say will be of so much advantage to you as the systematic and careful collection of figured sketches. I do not mean thereby the production of pretty pictures—a snap-shot will effect that—but the thoughtful study of an ancient feature, with a discrimination which gives, as far as possible, the reason why, is a valuable record; and the fact of delineating impresses the study upon the mind for ever and leaves a permanent influence for good.

The reflective habit should also be cultivated, whether in the contemplation of a noble building or the reading of a notable book. It is a good thing to sit before an old building and drink in its poetry; to cultivate the spirit of true criticism and inquiry. Beauty, like love, is divine and indefinable, but it must be pondered upon and pursued if it is to be secured.

In conclusion, I trust we shall return to our studies and duties after the recess with renewed energies, and that we shall be intent upon carving for ourselves a little niche, and leaving some executed work behind us which shall make the world more beautiful than it was before, and call forth the approval of those who will follow us.

Mr. ASTON WEBB, A.R.A., who proposed a vote of thanks to the President for his address, said it was twenty years ago that he occupied the chair as President of the Association, and his thoughts went back to that time. The address they had heard touched upon one of the points always mentioned on these days—the hope of having new premises. He spoke of a similar hope, and years before that presidents had expressed it. Mr. Hare had now gone further, for he said he would tell them of some scheme for the realisation of such hopes which had arrived at fruition. In his days the presidents were selected from the striving members, now they were elected from the thriving. Another difference that occurred to him was that in those earlier days they looked with some awe on the Royal Institute of British Architects, now the President of the Association was a member of the Council of that body. He said he was very glad that one of his first duties as President of the Institute was to be there that night and express on behalf of the Institute the very great interest that they took in the work that the Association was carrying on. They all recognised that the Association was almost a unique institution among professional bodies. The address alluded to competitions. He could only say that upon that point he entirely agreed with what Mr. Hare had said. The justification for competitions must lie in the fact that they gave the young architect an opportunity for distinguishing himself which might not otherwise come to him. The day school was a matter of congratulation to the Association, inasmuch that its first year had been one of success, and they were most fortunate in the appointment of Mr. Bolton, who had kindly undertaken the management.

Mr. W. H. SETH-SMITH seconded the motion. He said

the address had summed up the work of the Association in all its aims, and by practical suggestions had promised the attainment of them. The keynote of it was the defective system too often adopted in England of teaching a great deal of matter, a vast number of facts and formulae, without evoking the spirit of inquiry and thought which lay at the bottom of all true education. The Association in its efforts sought to remedy this.

Mr. JOHN SLATER, in support of the vote, said he was glad the name of Mr. Leonard Stokes had been mentioned in allusion to the work of the Association. The educational move proposed by Mr. Stokes helped materially to the success of the present scheme. With regard to the new premises, the President had been very reticent, and although he (the speaker) had taken an active part in the selection of site and locality, yet he would follow the President's example and be reticent too.

Mr. C. HARRISON TOWNSEND and Mr. E. W. MOUNTFORD also supported the motion.

### LIVERPOOL CATHEDRAL.

THE following criticism has been prepared by the Liverpool Cathedral petition committee on the reports issued by the Liverpool Cathedral executive committee:—

The Liverpool Cathedral petition committee have had under consideration the reports upon the cathedral recently issued by the executive committee and their advisory architects, and have decided that as the same inaccuracies are again and again advanced by the executive committee, though constantly refuted by the letters and publications of the petition committee and others, it is only necessary at this stage of the cathedral scheme to refer those who wish to inquire into the full truth of the matter to the honorary secretary of the petition committee for copies of those publications and for other information in the petition committee's possession. Attention, however, may very well be directed to the following points, which seem to be made clear by the reports, viz.:—

1. That the general committee, and not the executive committee, were charged by the public meeting "to carry out" the Liverpool Cathedral scheme, yet the general committee have not been consulted by the executive committee for the space of fifteen months, during which period matters of great moment have been decided, a cathedral Bill has been passed through Parliament, and a competition for designs for a cathedral has been held.

2. That, whilst the fact of Sir Alfred L. Jones, K.C.M.G., having seconded a resolution in favour of St. James's Mount site being adopted, at a date when the objections to that site were not so fully known, is set out with great prominence in the report, no reference is made to the fact that Sir Alfred L. Jones subsequently at a large public meeting expressed his disapproval of that site.

3. That it is not stated that the St. James's Mount site was recommended and adopted before the boreholes for testing the foundations were made; that it is not denied that those boreholes were driven as much as 40 feet deep to find solid foundations; that the intended position of the building has again and again been changed so as to endeavour to avoid the bad foundations of the Mount; that a smaller building is now contemplated to be erected, placed as far north of the Mount as possible and partly in the cemetery (which is some 50 feet below the Mount); and that further powers to absorb 2 acres of the cemetery for this purpose have been obtained from Parliament since the Bill was originally presented, in the endeavour to remedy the evils of the proposed site.

4. That, when it is stated that "all opposition has been withdrawn," it is not made sufficiently apparent that this statement only refers to Parliamentary opposition, and no reference is made to the fact that only by a bare majority of three did the City Council approve the sale of St. James's Mount Gardens to the cathedral promoters, and this notwithstanding that the cathedral promoters have members of their body upon the different Corporation committees which advised the City Council in the matter, and that the chairman of the cathedral executive committee spoke, as a member of the City Council, in favour of the resolution under which the sale was effected.

5. That, in regard to the submission of drawings in competition for the design of the cathedral, no mention is made in the reports of the damaging correspondence published in the *Times* which passed between Sir William Emerson, the previously selected architect for the Liverpool Cathedral, and Sir William Forwood, the chairman of the cathedral executive committee; that it is not sufficiently clearly brought out that the competition was open to the whole world, and that a mere total of 103 competing architects represents a very inconsiderable proportion of the architects of England alone, apart from those of the rest of the world; that only thirty-three architects even of this small total sent in designs for a cathedral, and that of these only four architects have been selected to further compete, the fifth architect selected to compete being one who

merely submitted illustrations of parish churches which have been erected from his designs; that, although 1,000 guineas is being paid to the advisory architects for their opinion (which is subservient to that of the cathedral executive committee), only 1,500 guineas is being paid to competing architects for five designs for a cathedral to cost 1,000,000*l.* (representing 5,000,000*l.* worth of architects' services, the scale charges for which would be some 125,000*l.*); that even after all this ill-paid skill and labour have been expended by the five presently selected architects, the cathedral executive committee are at liberty to invite and adopt the designs of other architects who have not incurred the expense and trouble of the first competition; and that in consequence of all these unsatisfactory conditions it seems quite improbable that the best possible design for a cathedral will be forthcoming.

6. That it is now officially announced that the sum promised towards the present scheme is only 154,114*l.* 16*s.* 3*d.*, which effectually disposes of previous misleading announcements by members of the executive committee as to the amount promised; that less than even half of this amount has been paid in; that only 2,696*l.* 4*s.* 9*d.* worth of promises has been received during the past ten months; that these facts are very strong indications of the unpopularity and almost complete lack of public support of the present scheme for a cathedral in Liverpool; and that even the executive committee admit in their report that "much more must be accomplished ere the cathedral scheme" can be "consummated."

7. That the report of the advisory architects, whilst embracing a series of good-natured platitudes, does not offer any serious criticism upon the designs submitted in the first competition, nor gives any practical indication of what a modern cathedral should provide, either for the special needs of the diocese of Liverpool or of elsewhere; that the strictures passed upon those architects who sent in illustrations of executed works are quite unmerited, inasmuch as those architects duly complied with the conditions of competition; that the surprise expressed by the advisory architects because the designs submitted were chiefly "Gothic" seems, when one remembers the expressed preferences of the executive committee, to be quite gratuitous; that the report of the advisory architects sufficiently indicates that what is required by the executive committee, and what the successful competitor will doubtless submit, is a lifeless academic reproduction, strictly in accordance with the "Gothic" manner, and that "our own English phase of the style" will be "adhered to."

8. That a dead site and a dead style seem to be the ideals of the executive committee, but the petition committee have confidence that the public, by withholding their subscriptions from the present cathedral scheme, will prevent ideals so lifeless being attained upon their behalf.

Committee-room (*pro tem*), 6 Dale Street, Liverpool: October 1, 1902.

### THE VENETIAN MONUMENTS.

THE Rome correspondent of the *Times*, writing from Venice, says:—When the Campanile collapsed some Venetian was attributed to one of the architects chiefly responsible for the "preservation" of monuments the remark that he had not foreseen the disaster because "he never thought St. Mark would play him such a trick." Given the close association of the ex-authorities with the local clerical party, the irony is sufficiently pungent, but upon looking into the problem of Venetian monuments as a whole one is forcibly reminded of the painting in which Paris Bordone represents the legend of St. Mark and the fisherman. It is as though the famous Saint had allowed the demons of carelessness and blatant self-satisfaction to throw down his tower in order to wake his city from its lethargy and show it the danger of yet greater evil.

Of all the questions confronting Signor Boni and his zealous coadjutors the reconstruction of the Campanile is the least difficult and the least urgent. True the connection of the fall of the Campanile with the general problem of the subsidence of Venetian soil must be elucidated; but the Campanile, for better or worse, is down, while other monuments, more beautiful and of at least equal historic import, are still standing and call loudly for defence and preservation. St. Mark's, the Doges' Palace, the Procuratie Vecchie, the Zecca and the churches of Santa Maria Gloriosa dei Frari and Santi Giovanni e Paolo need prompt attention, and in some cases drastic treatment, if catastrophe more irreparable than the fall of the Campanile is to be avoided.

How far St. Mark's as an edifice is in danger there are at present no means of ascertaining, though at first sight the marked inequalities in the pavement suggest a doubt whether the soil around the foundations may not have moved. More alarming, because more appreciable, is the great arch of the Apocalypse, which is lighted by the large central window facing the piazza. As one stands on the gallery of the façade, imme-

diately behind the bronze horses, the iron crossbars and framework of the window are seen to have been bent and dragged in towards the interior of the basilica by some displacement of the arch inside. From the internal gallery on the inside of the window, some 30 feet below the centre of the arch, it is easy to notice a crack in the mosaic running from the summit of the window for about three yards towards the interior. The origin of the crack and the extent to which it affects the brickwork of the vault cannot be judged by superficial examination, but the depth of similar lesions in other buildings points to the conclusion that this crack is a phenomenon of which it would be easy to under-estimate the importance. The full extent of the damage suffered by the arch of the Apocalypse is, however, visible only from the top of some scaffolding which has been erected on the inside of the window. At the window end, notwithstanding the crack, the arch preserves its semicircular form, but at the other end it sags downwards several inches, and perhaps a foot. Signor Manfredi, who is now in charge of the basilica, is convinced that all the mosaic of the arch must be removed and the 12-inch brick shell behind the mosaic more solidly reconstructed. He apprehends no immediate danger, and has applied through the ordinary bureaucratic channels for authority to reconstruct. It is to be hoped that authority will be given before any part of the mosaic or of the brickwork collapses.

In the Doges' Palace work has not yet gone much beyond the preliminary stage of investigation, except that the books of the Biblioteca Marciana have been removed from the rooms of the south-east corner, where danger was most apparent. Behind the empty bookcases serious diagonal lesions are visible in the walls, and the spectator feels as though the brickwork were slowly tumbling outwards towards the canaletto crossed by the Bridge of Sighs. The cause of this movement is not far to seek. The same Vendrasco who foretold the fall of the Campanile did not scruple to cut through one of the chief internal walls that run parallel to the façade, to make room for a lift in which the heavier books might be conveyed from one floor to another. Not only did he make an aperture fully 20 feet high and nearly 3 feet wide in this 18-inch wall, but he cut through a massive iron bar by which the wall had previously been braced together. Consequently the whole of the semi-detached portion of the wall between the aperture and the canaletto tends to topple outwards. It is not easy to see how the movement can be stopped, but Signor Boni, who has displayed so much skill in handling the Temple of Castor and Pollux in the Roman Forum, will probably be equal to the occasion. Further lesions, though perhaps of minor gravity, have been discovered in the wall of the Sala del Maggior Consiglio which sustains Tintoretto's mighty "Paradiso." The great canvas must be removed with all care and the wall strengthened. This work is already in progress.

A general examination of the Piazza San Marco has revealed serious lesions in the Procuratie Vecchie, and has necessitated summary measures for relieving and supporting some of the arches. Here also ulterior investigation may prove the general subsidence of Venetian buildings to have been a contributory cause, but it is unquestionable that the wholesale demolition of internal walls and the stacking of heavy merchandise in the rooms above the colonnade have helped to disintegrate the structure. The more dangerous points have now been relieved of pressure, and a scheme for thoroughgoing restoration is being drawn up. The best solution would probably be to expropriate the whole of the Procuratie Vecchie and treat them henceforth as a public monument.

The work on the Palace of the Doges and on the Procuratie Vecchie is in the hands of the Regional Bureau for the Preservation of Monuments—that is to say, of Signor Boni and of his efficient lieutenant, Professor Ongaro, who holds the chair of technical architecture at Padua University. They may err on the side of caution and minuteness, but they are not likely to fall into the gross mistakes now being committed by the Genio Civile in the Palazzo della Zecca. The Biblioteca Marciana is to be removed from the Doges' Palace because the weight of the books and manuscripts jeopardised that building, and the Civil Engineering Corps some time since fixed upon the Zecca as the aptest premises for the homeless library. One would therefore have supposed that the Zecca is stronger than the Doges' Palace. On the contrary, the Zecca is rickety from top to bottom. One wall is leaning outwards towards the garden of the Royal Palace; great cracks gape lazily in most of the rooms; a massive stone lintel has been split vertically by the disruptive force of the building; a vaulted ceiling intended to support a room above has had, in its turn, to be propped up by heavy beams, and workmen are now engaged in plugging the worst places with a few new bricks and in plastering cement into the widest fissures. So great is the tendency of the place to fall to pieces that a large hooked iron bar with which former restorers attempted to hold two walls together has snapped under the strain. The Civil Engineering Corps could imagine no better expedient than to place a second hooked bar over the one that has snapped, in the fond

hope that it may prove more efficacious than its predecessor. It is quite in keeping with the general style of these operations that the work of "restoration" should have been begun in the third storey and continued downwards. A man might as well hold himself by the hair to save himself from falling. The only solid place in the building is the old treasure-room, built in massive masonry and containing the splendid old Republican money chests. These chests it was proposed to sell as old iron. After such would-be vandalism it is not surprising that this incomparable Genio Civile should be preparing to roof in the Renaissance courtyard before arranging it as the reading-room of the library. The courtyard contains a deep well with a monumental well-head—at which, no doubt, students who may care to risk their health in the place will be able to damp their ardour. When roofed in, the courtyard will be deprived of air and light, and the rooms on the first and second floors, in which it is proposed to store the books, will be darkened, so that their contents may moulder more rapidly. The fine, well-lighted rooms in the front of the building, which look across the Canale di San Marco, are naturally reserved for the administration. Is it not the chief purpose of a library to provide snug quarters for its managers? The foolishness of the Zecca scheme is qualified only by the probability that the place will tumble to pieces before the library can be opened. It is really high time for the responsible authorities in Rome to put a stop to this expensive blundering, and if they do not care to incur the outlay of demolishing and rebuilding the second and third storeys, they will be wiser to leave their books piled up in some out-of-the-way corner than to squander public money in preparing a new catastrophe.

The state of the churches of Santa Maria Gloriosa dei Frari and of Santi Giovanni e Paolo inspires scarcely less disquietude than that of the Zecca. At the Frari the campanile has sunk at least 18 inches, and has dragged with it one side of the edifice. At Santi Giovanni e Paolo the imprudence of the ecclesiastical authorities in cutting away parts of the masonry to make room for tawdry side-altars has endangered the whole of one side of the church, while the sinking of the subsoil, or some other unknown cause, has twisted and bent the huge column which supports the north-west angle of the nave and the transept. Signori Boni and Ongaro have devoted the greatest attention to these two edifices, but it is doubtful whether all their pains will avail to save Santi Giovanni e Paolo. In the case of the Frari success is more probable, though by no means assured. In consequence of the work at the Frari, Gian Bellini's famous Madonna has been temporarily removed from its place in the sacristy and placed in a new light. The marvellous beauty of the picture is vastly enhanced by the change.

The problem of widest interest which Signor Boni and his colleagues are attempting to solve is that of the general subsidence of Venetian soil. The rate of subsidence can be determined only in relation to the sea-level, and the present level has already been marked by them at various points of all the monuments now in course of treatment. By establishing standard marks on these monuments and on all the islands in the lagoons, and by testing them periodically, it will be possible to ascertain the rate of future subsidence, while comparison with the standard marks on the Alps should reveal approximately the rate of subsidence in the past. Previous investigations lead Signor Boni to believe that the land has sunk at the rate of nine centimetres per century. A standard mark has been discovered on the lowest steps of the basement of the fallen Campanile. This mark was made by the military engineering corps twenty years ago, and unless the foundations of the tower have been displaced by the fall of the superstructure the mark should contribute to the solution of the general problem. As soon as the debris of the fallen Campanile have been completely cleared away an excavation will be begun around the piles upon which the tower rested. It will then be possible to see if and how any movement of the foundation hastened the fall of the structure, and further data as to its relation to the sea-level will probably be obtained. Meanwhile examination of the debris has thrown interesting light on the history of Venetian building. Splendid Veneto-Roman bricks, made at Aquileja in the first and second centuries, have been found in the masses of inferior material that fell from the tower. In quality these bricks surpass the best bricks of ancient Roman edifices and successfully resist a pressure of 300 kilogrammes per square centimetre, whereas the best modern Venetian bricks (not artificially compressed) cannot withstand a pressure of 50 kilogrammes. It is Signor Boni's intention to discover, if possible, the clay of which these Veneto-Roman bricks were made and to use it in the reconstruction of the Campanile. Apparently the Venetians, when driven by the barbarians to take refuge in their lagoons, lost the Roman tradition of building and forgot, moreover, the art of making good mortar. Thus the lower portion of the Campanile (900-1300) was built with bad mortar, and it was not until the conquest of Padua

by Doge Michele Steno in 1404 that a good quality of mortar was again introduced. Consequently the upper and later parts of the Campanile fell in solid masses, while the lower parts crumbled into dust.

Students and travellers, inspired by solicitude for the preservation of Venetian monuments as an important part of the artistic patrimony of Italy and the world, may feel assured that, except in the case of the Zecca, all that can be done is being done to preclude further loss. Great credit is due to Signor Nasi, Minister of Public Instruction, for the energy and promptitude with which he intervened as soon as the gravity of the situation became apparent. Local cliques and intrigue are strong in Venice. He rode rough-shod over them, and gave full powers to the one man in Italy who is qualified by experience and local knowledge to act discerningly. Doubtless Count Balenzano, Minister of Public Works, will clip the wings of the Genio Civile as soon as he knows what is being done at the Zecca. In regard to the preservation of Venetian monuments, Italy is on her trial before the cultured world. Those who best know how keen is the Italian sense of dignity, and how sterling the Italian character, feel most certain that she will come safely through the test.

### THE OLD CHURCHES OF NORTHAMPTON.

THE Church Congress is this year being held in a town and district, says the *Guardian*, which are replete with exceptionally interesting churches of ancient foundation. Like all English Mediaeval towns, Northampton used to be remarkably well supplied with churches for general worship, apart from those connected with hospital foundations, or of a conventual character. Within the walls were the seven parish churches of All Saints, St. Sepulchre's, St. Peter's, St. Giles's, St. Gregory's, St. Mary's and St. Michael's, as well as St. Katharine's, which was used at plague times for infected persons. Immediately outside the walls and really forming part of the church accommodation of the town, were the churches of St. Edward's, St. Leonard's, St. Margaret's, St. Bartholomew's and St. Lawrence's. Of all these old fabrics only four remain, namely, the first four of the parish churches just named.

The terrible fire of 1675—second only in the magnitude of the disaster to the Great Fire of London—destroyed almost the whole of the central church of All Saints. The inhabitants aided its destruction by heaping it full of their furniture and goods in the early hours of the conflagration. The following pathetically brief entry is all that the parish registers have to say upon the subject:—"While the world lasts remember September the 20th, a dreadful Fire; it consumed in a few hours 3 parts of our Town and Chief Church." To the rebuilding of the church, which was opened on September 5, 1680, the nation at large contributed. A table of benefactions towards the rebuilding still hangs in the consistory court, but is rapidly becoming illegible. The new church covers a considerable area, but is insignificant in its proportions compared with its predecessor. The tower, which now stands at the west end of the fabric, is in the main the old central tower of the former church, the nave of which used to extend right across the street to the west. The discolouration of the stones of the narrow tower arches by the fire can easily be seen in the interior. The only other part of the old church remaining is the crypt, or charnel-house, under the present chancel. It is not, however, worth visiting, as it has been so much altered to accommodate modern heating apparatus. It is somewhat remarkable that the name of the architect of the new church is unknown. Four lofty pillars of good proportion support a domed roof, which is a remarkably good example of seventeenth-century plasterwork. The great west portico, which gives some dignity to the building, was not completed until 1701. The absurd statue of Charles II., in toga, greaves and long flowing wig, was placed there in 1712; it was originally painted and gilded, but happily the weather has removed all traces of this colouring. The building underwent a considerable alteration in 1865-66. By a most unhappy decision the chancel screen, which was particularly handsome of its kind and formed a central feature of the original design, was removed. Most of its component parts have been worked up into the three entrance doorways from the vestibule into the church, so that its reconstruction would be a possibility.

Another extraordinary incident in connection with this restoration was the ejection of the monumental statue to Mr. Spencer Perceval, England's Prime Minister, who was assassinated in the lobby of the House of Commons in May 1812. His connection with the town was most intimate and of long standing; he had been its deputy-recorder for twenty-one years, and represented it for sixteen years in Parliament. The Corporation subscribed the sum of 1057. "for erecting a monument in All Saints Church." Upwards of 2,000*l.* was raised throughout the country. The work was placed in the hands of

the famous sculptor Chantrey, was completed in 1817 and placed in the chancel of the church. The statue is considered by competent judges to be amongst Chantrey's best efforts, but within fifty years of its erection it was thrust out, and remained for many years in the gloom of the town museum. The statue now stands in the council chamber of the town hall in a singularly bad light, and is but very rarely seen. Spencer Perceval was a devoted adherent to the Church of England, and when in office passed various measures for her benefit. Is it too much to hope that the meeting of the Church Congress in the town may stir up some of the good townfolk to replace this monument within the building for which it was designed? Fairly good accommodation for it might be found in the consistory court on the south side of the vestibule.

The most interesting old church remaining in the town is that of St. Sepulchre. Of the eight round churches so constructed in imitation of the great shrine over the Holy Sepulchre at Jerusalem that there used to be in England, four still remain in use, namely, those in London, Cambridge, Little Maplestead and Northampton, whilst the round chapel in the middle ward of Ludlow Castle is in ruins. The other three have disappeared. The Northampton round church is by far the most valuable of those that were extant. It was founded by Simon de St. Liz, Earl of Northampton, about 1100, shortly after his return from the Holy Land on the capture of Jerusalem towards the close of 1099, and was probably completed by 1108. The idea at one time prevalent and perpetually insisted upon, that this church was founded by the Knights Templars, is now definitely exploded. The order of the Templars was not established in England until 1134, when this church had already been for nearly twenty years in the hands of the Cluniac monks of the adjacent house of St. Andrew's. Even now, in the round, a tall aumbry or wall recess, doubtless designed to accommodate the processional cross and banner staves—there is another example at Earls Barton, and numerous ones in Norfolk churches—is pointed out as the place where the knights deposited their lances when they came to worship. Another strange notion, still clung to by some of intelligence, is that this church was originally a Jewish synagogue. It so happens that in the case of Northampton the exact site of the old synagogue, outside the walls and across the river at St. James's End, is known. This church is on the site of an older pre-Norman building; not a few of the stones in the Norman part show traces of Saxon zigzag dressings, and in the porch on the south side a Saxon sundial has been built up. East of the round—which served, as at Jerusalem, as a vestibule to the church proper—was a small church or chancel of three bays with an apse at the further end. The north, and subsequently the south walls of this building, were pierced with arcades to open into aisles of later addition. Traces of the original Norman lights can still be seen, as well as the corbel-tables over the arcades on each side, which used to be on the outside of the original building. The round was lighted by two tiers of twelve small round-headed windows, the lower tier opening direct into the building, whilst the upper tier gave light to the triforium above the groining of the circular aisle. The original small Norman clerestory would doubtless be also lighted with small windows, as in the severely restored example at Cambridge. Only one of the lower tier and two of the upper original windows remain in use, but the blocked-up portions of others can be readily detected. About A.D. 1200, or a little earlier, the church was enlarged by the addition of a north aisle to the chancel. St. Thomas of Canterbury was closely connected with Northampton, and one of the most stirring scenes in his dramatic life took place within a stone's throw of this church in the great monastery of St. Andrew. It has been reasonably conjectured that this aisle was built soon after his canonisation to accommodate a dignified altar to the memory of this famous archbishop. About 1275 another large aisle was thrown out to the north of its predecessor, which was pulled down in post-Reformation days and rebuilt in the prolonged restoration work which began in 1860. Towards the end of the fourteenth century many alterations and additions were made to this church; they were carried out on so extensive a scale that they dwarfed the original design of the round and destroyed the effect of its proportions. A fine west tower, surmounted by a spire, was erected against the round; its clerestory was removed and rebuilt, and pointed arches were substituted for the massive semicircular ones that had previously banded together the eight great columns. An outer founder's arch on the south side of the round was then inserted for the benefactor who effected all this change, but it does not seem to have been ever occupied. This church is throughout well worthy of close inspection; it is always open, well furnished and in beautiful order. There is one strange eccentricity about the modern fittings. The handsome new font in the centre of the round has a well-designed font cover; but this cover, for some strange reason, is rendered useless and foolish-looking by being always suspended some considerable height above the font itself.

St. Peter's Church, which stands near the London and North-Western Railway station, at the western extremity of the town, is a most beautiful and in some respects unique example of late enriched Norman. There has been not a little difference of opinion as to the actual date of the work, but there can be no doubt that it was erected on the site of an older stone church of pre-Norman construction in the latter half of the twelfth century. The capitals of the piers of the arcades on each side are delicately wrought with a profusion of characteristic carving. The comparatively slender piers, which afford a great contrast to those of the round of St. Sepulchre's, have projecting bosses half-way between the capitals and the bases; this is a most unusual feature; one of the few other instances is in the shafts of the elaborate late Norman doorway of Wroxham Church, Norfolk. The clerestory is handsomely arcaded. This church, too, merits the closest attention. Great care was taken with its restoration in 1850-52; but it would have been done on far better lines had the restoration been delayed for a few decades. The east end is entirely new. Originally the church obviously extended further west. The Norman work of the present west front was replaced there in pre-Reformation days. It is usually stated by those who are forgetful that every church and churchyard were sanctuaries, that St. Peter's had sanctuary privileges attached to it. This blunder probably arose from some misconception as to the peculiar privilege attached to this church as early as the thirteenth century. Any townsman accused of crime, who intended to try and clear himself by canonical purgation, was obliged to do so in this church and to spend the previous night here in vigil and prayer. It is of some interest to remember that when Henry VIII. did away with the general sanctuary privileges that attached to every consecrated building and to certain districts, such as the parishes of Westminster, Beverley and Beaulieu, he conferred sanctuary rights for minor offences on eight specific towns in different parts of the kingdom, of which number Northampton was one.

The fourth old parish church of the town is that of St. Giles's; churches of that dedication were usually outside the walls of cities and towns, and this was the case of Northampton until the borough walls were extended on the east about the year 1300. It is a large cruciform structure, with central tower, erected originally without aisles at the close of the twelfth century. The church has undergone much restoration and enlargement, but still possesses certain original features of the successive styles of English architecture.

The chapel of the old hospital that bore the double dedication to St. John the Baptist and St. John the Evangelist, and a portion of the old buildings, still remain in Bridge Street. This chapel was for a long period used by others than the hospital inmates after a quasi-parochial fashion. Unhappily it was sold, with the rest of the buildings, to the Midland Railway Company, but it was repurchased and is now in the hands of the Roman Catholics.

The county of Northampton, it is scarcely necessary to say, is deservedly famed for the beauty of its churches, and particularly for the gracefulness of their spires. On the railway line that stretches up the valley of the Nene from Northampton to Peterborough there is a station every two or three miles. The ecclesiologist can alight at any one of these and take any road either east or west, and he is sure to be abundantly satisfied with the churches that he will ere long encounter. If pre-Norman architecture attracts him he will not fail to visit Earls Barton, where there is also a wealth of Norman work; and a few minutes' journey on the Market Harborough line will bring him to Brixworth, a church of literally unique interest, where three separate dates of pre-conquest work are to be detected.

#### LIVERPOOL ARCHITECTURAL SOCIETY.

THE first ordinary meeting of the fifty-fifth session was held on Monday evening, the new president (Mr. John Woolfall) presiding over a large assembly of members.

In his opening address the President referred to the incorporation of the Society last year with the Royal Institute of British Architects, an event which would, he maintained, be far-reaching and important both to the members individually and the Society. A notable function during the coming year would be the holding of the annual conference of the Royal Institute of Public Health in Liverpool next July. The proceedings would be of the utmost interest to architects, and he trusted that among the subjects discussed would be that of the prevention of smoke in great cities. This problem must be faced by the municipal councils in the same determined manner, and with like results, as that of drainage, removal of refuse, pure water supply, artisans' dwellings, &c., for the public benefit and health. That this black cloud should be hanging about destroying health and everything else it touched could not be tolerated much longer. It was a filthy and dangerous nuisance. If remedial measures could be accomplished he be-

lieved it would beneficially influence architecture to a very great extent, and possibly coloured studies of permanent decorative materials would then partially supersede the columns, &c., of the present stone construction. The public improvements which were now being so vigorously proceeded with in Liverpool were providing opportunities for their architects to beautify and enrich the city, and he thought they were proving themselves well worthy of the opportunities. Dealing with the cathedral question Mr. Woolfall expressed delight that the city had decided to have a cathedral worthy of its position as one of the great cities of the kingdom. This effort, he remarked, "will be one of the greatest modern monuments that has been attempted since the Reformation, and will in time to come be a realised certainty. You may probably remember that this Society opposed the site now adopted, but our proposal was overruled on the plea of expense. The St. James's site is now settled, the preliminary competition has also been decided and the names of the competitors selected, and it is a matter for congratulation that our county town (Lancaster) has a firm of architects who have been chosen, and that one of the members of our own Society has won the honour of being highly commended for his scheme. May the final result be worthy of religion, its beauty a glory to our city; may it excite the public to possess one of the finest religious edifices in the world, the most perfect example of the most perfect period of art, being best fitted for the Christian worship of the present day. May all of us see the happy day when the foundation-stone of such a temple is laid, and may some of the present generation see it realised."

On the motion of Professor Simpson a hearty vote of thanks was tendered to the President for his address.

Subsequently a revised schedule of charges was submitted for discussion and approval.

### LONDON COUNTY HALL.

ANOTHER report has been prepared by the special committee upon the subject of the site of the proposed new offices of the London County Council on Adelphi Terrace. According to a special report of the finance committee, dated October 1, the acquisition of the site necessitates an outlay of 900,000*l.*, involving a charge of 44,500*l.* per annum on the county rate for interest and sinking fund. In addition, there would be the cost of the buildings to meet, but nothing whatever has been determined upon this head. But against it may be set the saving to be effected in annual rents paid for the present offices, about 18,500*l.* a year, allowing for an estimated rent of those properties of which the Council has freeholds or long leaseholds. The finance committee are of opinion that the advantages to be derived from the concentration of the Council's offices would, even from a financial standpoint, warrant a large expenditure on the provision of suitable accommodation. In justification of the proposed outlay the special committee give particulars of the present scattered offices in the tenancy of the Council. Of the 897 members of the staff at the central offices 386 are accommodated in the main buildings and 511 in outside offices. Much inconvenience is the natural result.

The area required on the Adelphi site is a little over three and a third acres. It is bounded on the north by William Street, the Tivoli Music Hall and Adam Street; on the south by the Embankment Gardens; on the east by the Hotel Cecil, and on the west by York Buildings. The work of extension could be confined to that portion of the site lying between the Embankment Gardens and John Street, and would probably necessitate (1) the widening of John Street from 38 feet to 50 feet, and (2) the widening of the street known as York Buildings from about 28 feet to 55 feet, in both cases the setting back being on the side of the road next the building; (3) the closing of part of Adam Street, (4) the closing of Adelphi Terrace, and (5) the closing of Robert Street. The clearance in view would entail the demolition of three hotels. A central entrance might be made to the county offices in John Street, the principal floor being about 7 feet above the general level of the street. On this floor there would be ample and suitable space for the Council chamber, lobbies, committee-rooms, members' rooms and the rooms of the chairman, vice-chairman and deputy-chairman of the Council, and those officers in immediate connection with the administrative work of the Council. Below the principal floor would be two floors of offices and above the principal floor five floors of offices. The committee regard it as desirable to keep the principal floor of the new offices at a uniform level throughout the buildings, for as this is necessarily of a greater height than the other floors any change in its level would disturb the horizontal lines of the elevation and necessitate steps in the corridor. If the principal floor is kept at slightly above the Strand level throughout it would be about 30 feet above the Embankment. This would admit of a projection containing two storeys of offices, and could be so treated as to form a

terrace along the entire south façade of the building and form an important access from the Embankment Gardens. The County Hall could thus be approached on the north from the Strand by way of Adam Street and John Street and from Villiers Street by Duke Street and York Buildings, and on the south from the Embankment Gardens.

Should an extension be made to that portion of the site lying between John Street and the northern boundary of the property, additional office room could be found for 150 officials, or 850 in all, 700 finding accommodation in the buildings fronting the Embankment. As to the cost—900,000*l.*—of acquiring the freehold with possession of the properties, the committee state that, compared with other sites which have been considered, the cost would be extremely moderate, and such a favourable opportunity as now presents itself is not likely to occur again. Since 1890, when the Council obtained Parliamentary power to borrow money to provide a site, eleven sites had been considered, including that of Christ's Hospital, one on the Victoria Embankment—east of the Temple Gardens—Barnard's Inn, a plot near the British Museum, Millbank Prison, the Foundling Hospital, warehouse property in Fenchurch Street, the site now occupied by the Hôtel Cecil, an area between the Horse Guards and New Scotland Yard on the Embankment, Farringdon Market and Parliament Street, between Great George Street and Charles Street. In the majority of these instances the sites are no longer available. The committee point out that the Adelphi site possesses many advantages architecturally, inasmuch as it will be bounded by three open sides and will be capable of simple and convenient planning. Moreover, it would have a frontage towards an insured open space under the control of the Council, and opening upon the river. This river façade would be equal in length to that portion of the Carlton House Terrace between the present London County Council offices and the Duke of York's Column. In the second place, the committee put forward the recommendation that the site is a central one, easily accessible and extremely quiet, and has a north and south aspect. In reply to the objection that it would be placing the County Hall in, so to speak, a back street, the committee, while admitting that the objection is a strong one, argue that it does not apply to the present scheme, as the Council will be able to use the important frontage opening upon the Embankment Gardens and the river. Also they point out that during recent years the London School Board, the Metropolitan Asylums Board, the Thames Conservancy and the Metropolitan Police have located themselves on the Embankment. The selection of the proposed site for a County Hall would still further identify the Embankment as the recognised quarter for public buildings, while the existence of Somerset House and the Houses of Parliament on the same frontage adds further importance to this significant characteristic. Finally, this is the last opportunity of obtaining a central site of this dimension facing the river.

### BERKS ARCHÆOLOGICAL SOCIETY.

THE members of the Berkshire Archæological Society, with several members of the Newbury Field Club, recently made a very pleasant excursion to Hungerford, Littlecote House, Avington and Welford. The weather fortunately was fine, and the day's excursion was much enjoyed. The party left Reading soon after ten o'clock for Newbury, where they were joined by the Newbury contingent, and proceeded to Hungerford, at which station brakes were in waiting to convey them to the interesting historical estate at Littlecote, the house of which is one of the oldest and most remarkable specimens of an Early Tudor mansion probably in England. It was originally built by the Darell family, but about the year 1593 the estate came into the possession of Sir John Popham, whose descendants still own the property, which is, however, now occupied by Mrs. Adolph Hirsch. On arrival at Littlecote Mr. Walter Money acted as cicerone, and conducted the party through the various apartments, and explained to them the many objects of interest. The great hall is about 46 feet in length and 25 feet in width, and on all its walls are various coats of armour, helmets, ancient carbines, accoutrements, &c. The long gallery and other parts of the mansion were also inspected with much interest, together with the numerous old paintings and portraits which adorn the walls. After spending a considerable time at Littlecote the party drove back to Hungerford, where lunch was partaken of at the Three Swans hotel. After lunch they adjourned to Hungerford Corn Exchange, where an interesting lecture on the history of Hungerford was given by the Rev. P. H. Ditchfield. The mayor (Mr. W. G. Alexander) took the chair, and welcomed the members of the Society to Hungerford. On the proposition of Mr. C. E. Keyser, seconded by Lord Saye and Sele, hearty votes of thanks were accorded to Mr. Ditchfield for his lecture and to the Mayor for presiding.

After leaving Hungerford, the excursionists drove to Avington, where they inspected the little Norman church there, the principal objects of interest in which were pointed out by Mr. Keyser, who remarked that Avington Church probably contained some of the truest and best specimens of Norman work to be found in Berkshire.

From thence they drove to Wickham Church, where they were met by the Rev. A. and Mrs. Batson, who kindly entertained the visitors to tea in the parish-room, after they had inspected Wickham Church. After tea Welford Church was visited, where Mr. Keyser again pointed out the chief features of interest.

About 6.20 the excursionists took the train at Welford Park station, on their return to Newbury and Reading, which latter station was reached about half-past seven.

## Correspondence

### Working Men's Dwellings, Alexandra Park.

SIR,—In your paper this week you give a long, detailed account of working men's dwellings in Glasgow, another of the amount of buildings erected during the past year, and a third of a vast drainage scheme for the same city, all of great interest in their own place; but what about the competition for schemes of working men's dwellings to be erected upon the Alexandra Park Estate, designs for which were sent in as long ago as February last and not adjudicated on unto this day—what about them and the architects who spent so much time and labour in preparing them? Are they never to be heard of again, or are they really lost to sight, as a professional paper spoke of them some time ago?—I beg to remain, Sir,

October 4, 1902.

QUERIST.

### GENERAL.

**The Architectural Association of Ireland** held their annual meeting on Tuesday. Mr. F. G. Hicks, the president, was chairman.

**Two Operating Theatres** have been added to the Liverpool Royal Infirmary from the designs of Messrs. A. Waterhouse & Son.

**An Exhibition** of works and designs by members of the Guild of Handicraft will be open for a week in the Woodbury Gallery. The private view will be to-morrow.

**The Druidical and Roman Remains** in the Yorkshire West Riding it is recommended should be placed where practicable under the guardianship of the County Council.

**At a General Assembly** at the Royal Society of British Artists, on Monday last, the following were elected members:—B. Haughton, W. J. Laidlay, A. M. Talmage and T. A. Falcon.

**The Surveyors' Institution** will hold the first ordinary general meeting of the session 1902-3 on Monday, November 10, when the president, Mr. Arthur Vernon, will deliver an opening address. The chair will be taken at eight o'clock.

**The Mayor of Orange** and the official commission have given permission for a series of theatrical performances in the Roman theatre of the city. They will be under the direction of Madame Caristie-Martel, whose uncle had charge of the restoration of the ancient ruins.

**Mr. Roosevelt** has arranged to have his portrait painted by Mr. John Sargent, R.A. The *New York Herald* says that Mr. Sargent is coming over in the course of a few weeks, and that the first sitting will be some time in November.

**The Roman Catholic Church** of Colchester is to be enlarged as a memorial to the late Dean Lucas, of that town. Cardinal Vaughan has approved of the plans, which provide increased accommodation for 100 persons at an estimated cost of 7,000*l*.

**The Clergy and Artists' Association** for the Improvement of Art in Churches, instead of holding their usual exhibition at the time of the Church Congress, will hold an exhibition this autumn in New York and the principal cities of the United States and Canada in connection with the Architectural League of New York. The exhibition will consist of reproductions of work executed in this country for churches under its auspices, including painting, sculpture, glass, architectural work, metalwork, embroidery, &c.

**M. Octave Gréard**, vice-rector of the Academy at Paris, having resigned his office, has presented to the Carnavalet Museum several objects which were found during the excavations on the site of the ancient Sorbonne. They include Gallo-Roman vases, sculptured stones and objects produced in the reigns of Louis XIV. and Louis XV.

**Stepney Borough Council** is to receive a grant of 1,000*l*. a year from the Government in lieu of rates on account of the Tower of London. The same body has decided to borrow 13,000*l*. for the purpose of improving narrow streets in Limehouse.

**The Local Society** for the prevention of consumption at Newcastle have decided to build a sanatorium for consumptive patients in Northumberland and Newcastle. The proposed building is to accommodate fifty patients, and will cost 50,000*l*.

**Mr. A. W. Ackermann, C.E.**, has dissolved partnership with Mr. W. Adamson in Cape Colony, where he has practised for twenty-six years. His business address is 47 Victoria Street, Westminster, S.W.

**The Bridge** over the Thames at Richmond has become so inadequate and unsuitable for its heavy and increasing traffic as to be dangerous to the public. The subject is referred to the general purposes committee of the local Council to consider and report as to the best means of securing the construction of a new bridge by the County Councils of Middlesex and Surrey, either on the site of the existing structure or in such other situation as may best conduce to the safety and convenience of the travelling public and the prosperity of the borough.

**The Late Mrs. Jane Ann Maldstone Smyth**, of London, has bequeathed several portraits to the Duke of Argyll, in trust for his Majesty the King or his successor. They include portraits of Carolina Matilda, Queen of Denmark; Sir Robert Murray Keith (1730-95), Ambassador at Copenhagen and Vienna; another of Sir Robert with two of the Court ladies, and a miniature of Marie Antoinette.

**The Foundation-stone** of a church at Eastney has been laid by the Bishop of Guildford. The building will cost 7,500*l*., but at first the permanent chancel will be carried out at a cost of about 3,000*l*. Mr. J. T. Lee is the architect. The style is Early English, and the church when completed will accommodate 800.

**A New Building** in Tooley Street is to take the place of the police-court in High Street, Borough. At the present time the contractors are engaged on the foundations, and the new structure, which will be one of the best in the Metropolis, will be completed in about two years. A police-station will be erected adjoining to take the place of Bermondsey Street station, which for a long time has been recognised as far too small and inconvenient to meet the needs of the locality.

**The Agent-General** for New South Wales has addressed a letter to the Westminster City Council offering, for experimental purposes, 9,000 New South Wales hardwood blocks (3,000 each of black butt, tallow wood and box) with a view to a practical test as to their value for road purposes as compared with the American blocks now being used in London, and suggesting that the blocks should be laid side by side with an equal number of other timbers now being used in the city, if possible, where the traffic is of the heaviest and most constant description.

**The Baguley Sanatorium**, erected by the Withington Urban District Council for the treatment of infectious diseases, was publicly opened by the Earl of Derby on Saturday afternoon. The situation of the hospital at Baguley is a most favourable one, as the institution stands 155 feet above the sea-level, and is surrounded by a fine expanse of open country. Although the site contains over 38 acres, at present 12 acres only have been enclosed for hospital purposes. Within this area there are five separate blocks of buildings, providing accommodation for fifty-six scarlet fever patients, thirty-six diphtheria or enteric fever patients, and eight isolation beds. There is also an administration block, containing rooms for the resident doctor, matron and twenty-five nurses. In the kitchen block provision is made for twenty-two servants, and there is ample space for use as store-rooms. The buildings, though plain, are of substantial character, and the interior arrangements are very complete.

**A Good deal** of feeling has been aroused in Guildford by a proposal recently adopted by the Town Council, which, if carried out, will involve the demolition of the old Corn Exchange, one of the most distinctive features of the picturesque High Street. This building, which stands immediately opposite the quaint town hall, with its clock projecting over the street, was erected at the beginning of the last century. For very many years the assizes for the county were held in the building, and it was here in 1860 that after some remarkable proceedings the then high sheriff, Mr. W. J. Evelyn, of Wotton, was fined 500*l*. for contempt of court by the Lord Chief Justice Cockburn. The Town Council have recently erected a new corn exchange in the cattle market, and in order to widen the road known as the Tuns gate, and make a better approach to Pewley Hill, it is proposed to remove the Corn Exchange and other buildings.

## Architect and Contract Reporter.

## EDITORIAL NOTICES.

*In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.*

*The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.*

*The authors of signed articles and papers read in public must necessarily be held responsible for their contents.*

*No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.*

*Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.*

## TENDERS, ETC.

*\*\* As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

## COMPETITIONS OPEN.

CAPE TOWN.—Jan. 31.—The Council of the University of the Cape of Good Hope invite designs for the erection of university buildings. Premiums of 400*l.*, 200*l.* and 100*l.* will be awarded to the authors of the designs placed first, second and third respectively. Particulars of the competition may be obtained on application to the Registrar at Cape Town, or to the Agent-General in London.

DURBAN (NATAL).—Dec. 18.—Designs are invited for new town hall, library, museum, art gallery and municipal offices. Three premiums of 500*l.*, 300*l.* and 200*l.* respectively will be awarded for the three best designs in order of merit. Mr. W. H. Radford, C.E., Albion Chambers, Nottingham.

GREENWICH.—Designs are invited for a public library (with chambers for chief librarian's residence) to be erected at a cost of about 6,500*l.*, with fittings, on a site about 7,000 feet super, in the borough of Greenwich. Premiums of 50*l.* and 30*l.* are offered. Particulars can be obtained on application to the Greenwich Borough Council.

INDIA.—Nov. 1.—Competitive designs are invited for the erection of a memorial to Her Majesty the late Queen Victoria at Allahabad. A premium of 2,000 rupees will be awarded to

the design selected by the committee. Mr. H. Nelson Wrigh Indian Civil Service, honorary secretary, Queen Victor Memorial Fund Committee, Allahabad, India.

NEWARK.—Oct. 14.—Designs and suggestions are invite for alterations and additions at the infirmary, Bowbridge Road, Newark, comprising a board and committee-room, a new mortuary and provision for twenty extra beds. A prize of twenty guineas is offered for the best plans sent to the office of Mr. M. H. Colton, clerk, 27 Lombard Street, Newark.

STROOD.—Oct. 15.—Plans are invited for further hospital accommodation on a site recently acquired by the Strood Rural District Council in Whitehill Road, Cobham. A premium of 15*l.* 15*s.* is offered for the best set of plans submitted.
